KEY TO PRONUNCIATION

For a full explanation of the various sounds indicated, see the KEY TO PRONUNCIATION in Vo. I.

ā	as in ale, fate.	ch	as in chair, cheese.
ā	" " senate, chaotic.	d	" " Spanish Almodovar, pulgada, where t is nearly like th in English then.
ā	" " glare, care, and as e in there.	g	" " go, get.
ā	" " am, at.	g	" " German Landtag = ch in Ger. achete.
ā	" " arm, father.	h	" " j in Spanish Jijona, g in Spanish ga; ike English h in hue, but stronger.
ā	" " ant, and final a in America, armada, etc.	hw	" " wh in which.
a	" " final, regal, pleasant.	k	" " ch in German ich, Albrecht = g in German Arensburg, Mecklenburg, etc.
a	" " all, fall.	n	" " in sinker, longer.
a	" " eve.	ng	" " sing, long.
e	" " elate, evade.	n	" " French bon, Bourbon, and m in the French Etampes; here it indicates nasalizing of the preceding vowel.
e	" " end, pet.	sh	" " shine, shut.
e	" " fern, her, and as i in sir, etc.	th	" " thrust, thin.
e	" " agency, judgment.	th	" " then, this.
i	" " ice, quiet.	zh	" " z in azure, and s in pleasure.
i	" " quiescent.		
i	" " ill, fit.		
i	" " old, sober.		
i	" " obey, sobriety.		
i	" " orb, nor.		
i	" " odd, forest, not.		
o	" " atom, carol.		
oi	" " oil, boil.		
oo	" " food, fool, and as u in rude, rule.		
ou	" " house, mouse.		
ū	" " use, mule.		
ū	" " unite.		
ū	" " cut, but.		
u	" " full, put, or as oo in foot, book.		
ū	" " urn, burn.		
y	" " yet, yield.		
z	" " Spanish Habana, Córdoba, where it is like English v but made with the lips alone.		

An apostrophe ['] is sometimes used as in ā'h'l (table), kǎz'm (chasm), to indicate the elision of a vowel or its reduction to a mere murmur.

For foreign sounds, the nearest English equivalent is generally used. In any case where a special symbol, as g, h, k, n, is used, those unfamiliar with the foreign sound indicated may substitute the English sound ordinarily indicated by the letter. For a full description of all such sounds, see the article on PRONUNCIATION.

A PARTIAL LIST OF THE LEADING ARTICLES IN VOLUME VIII

- ENZYME.**
 Professor John Merle Coulter.

* Deceased.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

ENTERITIS (Neo-Lat., from Gk. *ἐντέρον, enteron*, intestine). Inflammation of the bowels, and especially of their muscular and serous coat, accompanied by pain, colic (q.v.), and diarrhoea (q.v.), or dysentery (q.v.). Enteritis in children (see CHOLERA INFANTUM) is often fatal. It attacks the entire digestive tract, generally being a gastroenteritis. Abstinence from food, washing the colon with large enemata of water, and sterilization of drinking water are essential in the treatment of these cases. In adults enteritis is benefited by mild purgation, followed by opiates and fasting. If the colon is attacked, the term used is *colitis*, properly a subdivision of enteritis. *Typhlitis* is an inflammation of and about the cæcum (q.v.), and *appendicitis* (see VERMIFORM APPENDIX) is an inflammation of the appendix. These are dangerous and frequently fatal. Rest, opiates, and poultices or ice may ameliorate some cases. Operation is generally necessary in appendicitis. In all cases the diagnosis and treatment must be left to the physician.

In the Lower Animals. Inflammation of the bowels, among the heavier breeds of horses, generally results from some error of diet, such as a long fast, followed by a large, hastily devoured meal, indigestible or easily fermentable food, or large drafts of water at improper times. When thus produced, it is frequently preceded by stomach staggers or colic, affects chiefly the mucous coat of the large intestines, and often runs its course in from 8 to 12 hours. With increasing fever and restlessness, the pulse soon rises to 70 or upward, and in this respect, unlike colic, continues throughout considerably above the natural standard of 40 beats per minute. The pain is great, but the animal, instead of recklessly throwing himself about as in colic, arises and lies down cautiously. When standing, the horse frequently turns his head backward and looks at his flanks. Respiration is quickened, the bowels are torpid. Cold sweats, stupor, and occasionally delirium, precede death. When connected with, or occurring as a sequel to, influenza, laminitis, and other complaints, the small intestines are as much affected as the large, and the peritoneal as well as the mucous coat of the bowels. This form is more common in the lighter breeds. When the patient is seen early, while the pulse is still clear and distinct and not above 60, and the

legs and ears are warm, bloodletting is useful, as it relieves the overloaded vessels, and prevents that exudation of blood which speedily exudes into the interior of the bowels in cases of hemorrhagic enteritis. This disease should be treated as follows: In a pint of oil, or an infusion of two drams of aloes in hot water, give a scruple of calomel and an ounce of laudanum, and repeat the calomel and laudanum every hour in gruel until the bowels are opened, or until five or six doses are given. Encourage the action of the bowels by using, every half hour, soap-and-water clysters, to which add laudanum so long as pain and straining continue. If the animal is nauseated and stupid, with a cold skin, weak, quick pulse, bleeding and reducing remedies are very injurious; and the only hope lies in following up one dose of the calomel and aloes with small doses of laudanum and sweet spirit of nitre, or other stimulants, repeated every 40 minutes. In all stages woolen cloths wrung out of hot water and applied to the belly encourage the action of the bowels and relieve the pain.

Enteritis in cattle is produced by coarse, wet pasture, acrid or poisonous plants, bad water, and overdriving. The symptoms are fever and thirst, a quick but rather weak pulse, restless twitching up of the hind limbs, tenderness of the belly, torpidity of the bowels, and cessation of rumination. Calves generally die in three or four days, other cattle in a week or nine days. Bleed early, open the bowels with a pint of oil and a dram of calomel, which may be repeated in 8 or 10 hours if no effect is produced. Give, every hour, 15 drops of Fleming's tincture of aconite in water, until six or seven doses are given. Allow only sloppy and laxative food, such as molasses, gruel, or a thin bran mash; employ clysters and hot cloths to the belly and use two-ounce doses of laudanum if the pain is great. Enteritis in sheep mostly occurs in cold, exposed localities, and where flocks are subjected to great privations or improper feeding.

ENTEROHEPATITIS. See BLACKHEAD.

ENTFÜHRUNG AUS DEM SERAIL. Die, Ent-fu'run'g aus dem sä-ril' or sä-ril' (Il Seraglio). An opera by Mozart (q.v.), first produced in Vienna, July 13, 1782; in the United States, October, 1862 (New York).

ENTHYMEME (Gk. *ἐνθύμημα, enthymēma*, argument, from *ἐνθυμεῖσθαι, enthymeisthai*, to ponder, from *ἐν, en*, in + *θυμός, thymos*, mind). A term used by Aristotle to denote a syllogism

"from probabilities and signs"; now a technical name in logic for a syllogism with one of its premises or its conclusion unexpressed. For instance, "The steamship *Rio Janeiro* could not have been built in water-tight compartments, for it sank in 15 minutes"—the suppressed premise being, "No steamship built in water-tight compartments sinks in 15 minutes." Almost all ordinary argumentation is conducted in enthymemes. See DEDUCTION; LOGIC.

ENTIRETY (from *entire*, OF., Fr. *entier*, It. *intero*, from Lat. *integer*, whole, from *in*, not + *tangere*, to touch), **TENANCY BY**. The form of joint estate which subsists between husband and wife. Like the ordinary joint estate, it arises upon a conveyance or devise to the two persons together who are to hold the premises, and, like that also, it is attended with the right of survivorship, as incident to the estate, the interest of the one dying first passing to the other and not to the heirs of the decedent. But the circumstance that the joint tenants are here husband and wife, and have therefore identical interests in the property, has differentiated the tenancy by entirety in some important respects from joint tenancy proper. The joint tenant may ordinarily convey his interest separately from his cotenants, thereby dissolving the joint estate and destroying the right of survivorship. But this is not permitted in the case of a tenancy of the entirety; neither can the estate be partitioned during the existence of the marriage relation, though it is dissolved by a divorce and the parties thereupon converted into joint tenants or tenants in common, usually the latter.

The estate is one which is much favored by the law, and it has accordingly been generally held that it is not affected by statutes abolishing joint tenancies, or creating a presumption in favor of tenancies in common; nor yet by the more recent legislation known as the married women's acts, whereby a wife is rendered capable of holding and conveying real estate free from the control of her husband. But in a few States the contrary view has been taken, and in a few others the tenancy by entirety has never been recognized. In most of the United States, however, the estate still exists without material change in the characteristics which it had at the common law. See HUSBAND AND WIFE, and the authorities there referred to.

ENTOMBMENT, THE. A frequent subject of paintings, representing the burial of Christ. One of the most celebrated is that by Raphael, painted in 1507, for the church of San Francesco, Perugia, and now in the Palazzo Borghese, Rome. The finest representation of the subject is by Titian in the Louvre (1523). It shows the body of Christ suspended in a cloth, borne to the sepulchre by Nicodemus and Joseph of Arimathea. St. John supports one arm, and to the left are the Virgin and the Magdalen. It is a consummate masterpiece, not only in technique (the composition, color, and chiaroscuro being especially effective), but as a sublime and profound expression of religious feeling. Another example by Titian (1559) is now in the Madrid Gallery. Tintoretto also painted two masterly pictures on the subject—one in the Parma Gallery, the other in San Francesco della Vigna, Venice. Caravaggio's celebrated "Entombment" (see CARAVAGGIO for reproduction) is in the Vatican Gallery. Other well-known representations of the subject are by the Italian masters Gaudenzio Ferrari (Turin),

Annibale Carracci (Louvre), Garafalo (Palazzo Borghese, Rome), and the sculptor Donatello (South Kensington Museum, London); and by the Flemish painters Rogier van der Weyden (Uffizi, Florence), Quentin Matsys (Antwerp), and Van Dyck (Antwerp).

ENTOMIS, *en'tō-mis*. A genus of minute fossil ostracods with subovate or fabiform shell, the valves of which are characterized by a deep submedian vertical furrow extending to the hinge line. The genus ranges from the Ordovician to the Carboniferous period, but its remains are most profuse in the Devonian strata. The species *Entomis serrato-striata* composes certain beds of the Upper Devonian of middle Europe. See OSTRACODA.

ENTOMOLOGICAL SOCIETY, AMERICAN. An organization for the investigation of the character and habits of insects, founded at Philadelphia in 1859, incorporated in 1862, and known until 1867 as the Entomological Society of Philadelphia. The results of its investigations are published in its *Proceedings and Transactions*, beginning in 1861, and also in the *Entomological News*, the latter issued monthly with the cooperation of the entomological section of the Academy of Natural Sciences of Philadelphia. It owns a valuable entomological collection and library. Membership in 1914 was about 140.

ENTOMOL'OGY (Neo-Lat. *entomologia*, from Gk. *ἐντομον*, *entomon*, insect, from *ἐν*, *en*, in + *τομή*, *tomē*, a cutting, from *τέμνειν*, *temnein*, to cut + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). That part of the science of zoölogy which treats of insects. See INSECT.

ENTOMOPH'ILOUS PLANT (from Gk. *ἐντομον*, *entomon*, insect + *φίλος*, *philos*, dear, from *φιλέω*, *philein*, to love). A plant whose pollen is carried from one flower to another by means of insects. A contrasting phrase is "anemophilous plant," meaning one whose pollen is carried about by the wind. See POLLINATION.

ENTOMOPHTHORALES, *en'tō-mōf'thō-rā-lēz* (Neo-Lat., from Gk. *ἐντομον*, *entomon*, insect + *φθορά*, *phthōra*, destruction). A group of parasitic fungi fatal to insects, the common house fly often being destroyed by them. The spore in germination sends out a tube that penetrates the body of the insect, which finally becomes filled with the mycelium of the fungus. The dead bodies of flies may be seen adhering to a windowpane often surrounded by a halo of spores.

ENTOMOSTRACA (Neo-Lat. nom. pl., from Gk. *ἐντομον*, *entomon*, insect + *στρακον*, *ostrakon*, shell). One of the two subelasmes of crustaceans (q.v.). Many of them are minute and exist in great numbers both in fresh and salt water, particularly in stagnant or nearly stagnant fresh water, affording to many kinds of fishes their principal food. They differ much in general form; the number of organs of locomotion is also various—in some, few; in some, more than 100—usually adapted for swimming only and attached to the posterior as well as to the anterior segments; but there never is a fin-like expansion of the tail, as in some of the malacostracous crustaceans. The body is divisible into two parts, a head and a trunk, but the latter shows no differentiation into thorax and abdomen. The antennae are generally well developed and are often used, especially the second pair, as organs of locomotion. Some of the En-

tomostraca have mouths fitted for mastication and some for suction. Not a few are parasitic. The heart has the form of a long vessel. The organs of respiration are in certain species attached to some of the organs of locomotion, in the form of hairs, often grouped into beards, combs, or tufts; or bladeliike expansions of the anterior legs are subservient to the purpose of respiration; in others no special organs of respiration are known to exist. The nervous system, like that of most arthropoda (q.v.), consists of a brain or supra-oesophageal ganglion and a more or less elongated double ventral cord connected with it by a commissure on each side of the oesophagus and provided with six or seven pairs of ganglia. In most entomostracans, however, the nervous system is more concentrated, sometimes to such an extent that it consists of a single ganglionic mass, through which the oesophagus passes. The eyes are of two distinct sorts; nearly all the species have a median unpaired eye, sometimes well developed and sometimes greatly reduced. Many forms also have a pair of lateral eyes, which are sometimes stalked. The name Entomostraca has been given to these creatures in consequence of most of the species having shells of many pieces, rather horny than calcareous, and very delicate, generally almost membranous and transparent. In many the shell consists of two valves, including more or less of the body, capable of being completely closed, but which, at the pleasure of the animal, can also be opened so as to permit the antennae and feet to be stretched out.

The Entomostraca comprise many thousand species, which are readily grouped in four great orders, according to the arrangement and structure of the shell and appendages: PHYLLPODA; OSTRACODA; COPEPODA; CIRRIPODA (qq.v.).

ENTOPHYTE. See **ENDOPHYTE**.

ENTOZO'Á (Neo-Lat. nom. pl., from Gk. *éntos*, *entos*, within + *zōon*, *zōon*, animal), or **ENDOPARASITES**. Parasitic animals living within the tissues or organs of other animals. The term "entoza" or "enteroza" was formerly extensively used, especially for the internal parasites of man. In recent years the name has fallen into disuse, because it did not include a natural assemblage of forms, but animals of several different types. The opposite term is "ectoza" or "epizo"—the former designating parasites resident upon or within the skin, and the latter the same with more particular reference to crustaceous parasites of fishes. See **PARASITE**; **FLATWORM**; **TAPEWORM**; **FLUKE**; **GUINEA WORM**; **ROUNDWORM**; **ETC.**

ENTRECASTEAUX, *ân'tr'-ka'stô'*, JOSEPH ANTOINE BRUNI, CHEVALIER D' (1739-93). A French navigator, born at Aix (Provence). He entered the navy at the age of 15 and three years later won the grade of ensign for valor displayed during the battle of Minorca (1756). In 1786 he became commander of the East India Station, and in 1787 he was appointed Governor of Mauritius and the Isle of Bourbon. He later explored New Caledonia (1791-92), where he was sent in search of the missing expedition of La Pérouse, and discovered several groups of islands. He died at sea, off the north coast of New Guinea, July 20, 1793. His name is perpetuated in the Entrecasteaux Archipelago; Entrecasteaux Point, on the southwestern coast of Australia; and in Entrecasteaux Channel, between Tasmania and Brunel Island. Consult *Voyage d'Entrecasteaux à la recherche*

de La Pérouse (1808), and also Hulot's *D'Entrecasteaux* (Paris, 1894).

ENTRE DOURO E MINHO, *ân'tre dô'ro à mé'nyo* ('between Douro and Minho'), or **MINHO**. A province of Portugal, bounded by Spain, from which it is separated by the Minho on the north, the Portuguese Province of Trás-os-Montes on the east, the river Douro on the south, and the Atlantic on the west (Map: Portugal, A 2). Area, 2808 square miles. The surface is broken and mountainous, with some snow-capped peaks in the eastern part. The numerous streams afford irrigation facilities, and the soil is well cultivated. For administrative purposes the province is divided into the three districts of Vianna do Castelo, Braga, and Porto (Oporto). It is the most densely populated province of Portugal. Pop., 1890, 1,091,936; 1900, 1,170,361; 1911, 1,289,066.

ENTRE MINHO E DOURO. Form of name preferred by the Portuguese for **ENTRE DOURO E MINHO** (q.v.), or **MINHO**.

ENTREMONT, *COMTE D'*. See **L'HOPITAL**.

ENTRE RIOS, *ân'trã rê'ôs* ('between rivers'). A province of Argentina, bounded by the Province of Corrientes on the north, Uruguay River on the east, and the Paraná on the south and west (Map: America, S., H 4). Area, 28,792 square miles. The country is generally flat, well wooded, and well watered. Cattle raising and agriculture are the principal occupations of the inhabitants. The province is amply provided with transportation facilities through its railways and navigable waterways. The chief exports are animal products. Pop., 1892, 367,000; 1912 (official estimate), 429,348. Capital, Paraná.

ENTRESOL, *Fr. pron. ân'tr'-sôl'* (Fr. *entre*, between + *sol*, ground). A low story between two main stories of a building (generally between the ground floor and the main story), or inserted in the upper portion of a high story, when certain rooms are of greater height than the others upon the same floor. It is sometimes called the *mezzanine* floor. See **MEZZANINE**.

ENTROCHITE. See **BEADS**, **ST. CUTHBERT'S**.

ENTROPION, or **ENTROPIUM** (Neo-Lat., from Gk. *ἐντροπία*, *entropia*, *ἐντροπή*, *entropê*, introversion, from *ἐν*, *en*, in + *τρέπειν*, *trepein*, to turn). Inversion of the margin of the eyelid, consequent either on loss of substance ("cicatricial entropion") or on spasmodic contraction of the orbicularis palpebrarum muscle which closes the eyelids ("spasmodic entropion"). The latter form occurs chiefly in old persons, in whom the skin of the eyelid is relaxed and the eyeball sunken. The symptoms are due to the irritation of the cornea by the eyelashes, which are inverted and rub against it. (See **TRICHIASIS**.) Removal of the lashes may relieve temporarily, but unless the cause can be removed operation is necessary.

ENTROPY. See **ENERGETICS**; **THERMODYNAMICS**.

ENTRY. The entrance into a mine. The term usually refers to a level or sloping entrance into a coal mine and is rarely used in connection with metal mines.

ENTRY, **RIGHT OF**. In the common law, the right to consummate an inchoate or incomplete title to land by taking possession thereof. This right is in legal theory coextensive with the right of possession, but it carries with it the implication that such possession is wrongfully

withheld or, at least, that it has not been transferred to and assumed by the person entitled.

The right arises under three sets of circumstances: (a) Where an estate has passed by descent, or a lease for years has been made to a person not in possession. In such case the common law requires the heir or the lessee to enter upon the land in order to invest himself completely with the estate to which he has thus become entitled. (b) When lands are unlawfully withheld under a claim of freehold, from a person entitled thereto, as by a disseisin or adverse possession. The rightful owner may at common law, by an actual reentry upon the lands, restore his title and thus prevent the adverse possession from ripening into a complete title. (c) Where lands have been conveyed upon a condition and the condition has been broken. Here the estate remains unaffected until the grantor or his heir exercises his right of entry, whereupon the estate of the grantee is ipso facto determined and the grantor "is in of his old estate."

The peculiar nature of the right of entry as a legal right appears from this enumeration of cases to which it is applicable. Though having to do with real estate, it is not itself an estate or interest in lands, nor, indeed, any species of property whatsoever, either corporeal or incorporeal; and though it will usually descend to the heir of the person entitled to it, it is in most cases incapable of assignment or transfer either by deed or will. On the other hand, it is not a mere right of action, which could not, by any magic, be transmuted, like the right of entry, into a substantial estate.

Originally a right of entry might be exercised by force, if necessary, but by an early English statute (5 Rich. II, st. 1, c. 8) it was provided that this remedy must be pursued "in a peaceable and easy manner, and not with force, or strong hand"; and since that date an entry, if opposed, can be made only by legal process. (See **FORCEFUL ENTRY**.) The usual method provided is a summary proceeding instituted by writ of entry, under which, if it be defended, the right to the possession of the property in dispute can be tried and legally determined. In some of the United States this procedure must be followed in every case, even where the entry of the claimant is not disputed, but in others the common-law remedy is still available where the entry can be made without force. A right of entry is extinguished by an open and notorious possession of the premises for the period prescribed by the Statute of Limitations, which in the United States is usually 20 years. See **ADVERSE POSSESSION**; **CONDITION**; **DESCENT**; **CASE**; **DISSEISIN**; **LIMITATION**.

ENTRY, WRIT OF. An ancient form of action at common law for the recovery of the possession of land wrongfully withheld from the claimant. It belonged to the class of possessory, as distinguished from *droit* remedies, in the latter of which the right (*droit*) or title to the land was tried, and in the former the mere right of possession. But the feudal origin and character of our land law made title or ownership of real property depend in most instances on the possession of the land, and accordingly the possessory remedies came gradually to supersede those which were based upon a direct and exclusive assertion of ownership. There were many of these possessory remedies appropriate to various circumstances (of which the

assize of *novel disseisin* and the assize of *mort d'ancestor* were in most general use); but the one which was available in all cases of wrongful ouster or dispossession, whether otherwise provided for or not, was the writ of entry. The efficacy of this proceeding was due to the fact that it gave effect to the right of entry, by the exercise of which one who was entitled to a freehold estate was enabled by the mere act of taking possession to reinvest himself with his rights therein. (See **ENTRY, RIGHT OF**.) In the course of time the proceeding by writ of entry became as intricate and complicated as the earlier remedies which it had displaced, and it was gradually abandoned in favor of the more summary action of ejectment. (See **EJECTMENT**.) After having long fallen into disuse, the writ of entry was, along with the other ancient possessory remedies, abolished by Act of Parliament, in 3 and 4 Will. IV, c. 27, § 36. It survives in several of the United States, however, in a simplified form, and usually for special purposes only—as, in some of the New England States, as a means of enforcing a mortgage. See **ASSIZE**; **FORECLOSURE**; **SEISIN**. Consult the authorities referred to under **REAL PROPERTY**.

ENTWISLE, JOSEPH (1767–1841). An English Wesleyan Methodist clergyman, born in Manchester. In 1787, at the call of John Wesley, he entered the ministry; in 1812 he was elected president of the conference, and from 1834 to 1838 he served as governor of the Wesleyan Theological Institution. He wrote *Memoirs of Rev. J. Pauson* (1809) and *An Essay on Secret Prayer as the Duty and Privilege of Christians* (11th ed., 1861). Consult the *Memoir* by his son (Bristol, 1848; 4 later eds.).

ENTWISTLE, ENTWISL, JAMES (1837–1910). An American naval officer, born at Paterson, N. J. He entered the engineer service of the navy in 1861, was in the Western Gulf squadron in the Civil War, was commissioned lieutenant commander in 1873, was promoted to be commander in 1888, served as inspector in different dockyards for construction of warships, joined the Asiatic squadron in 1895, and distinguished himself in the battle of Manila Bay, May 1, 1898. In 1899 he became captain and rear admiral and was retired.

ENURESIS. See **URINE, INCONTINENCE OF**.

ENVELOPE (OF. *enveloper*, *envelopper*, *envelopper*, Fr. *enveloppe*, to enwrap). A paper covering extensively employed for inclosing letters, circulars, pamphlets, and other mail matter, and for an endless variety of other purposes. Envelopes began to be used in England and the United States in the decade from 1840 to 1850. In both countries their use for letter mail followed the introduction of cheap postage. At first the blank forms from which envelopes are made were cut by hand to a pattern and also gummed and folded by hand. The first practicable machine for making envelopes was patented in England in 1844 by Warren De la Rue and Edwin Hill. In America the first patent was granted in 1849 to J. K. Park and C. S. Watson. The De la Rue machine was in many respects similar to the machines now in use, as described below; but instead of gumming and lifting the blank in practically one operation the blank was lifted by India-rubber fingers, then gummed by a separate arm.

Envelopes are now made entirely by machinery, and their manufacture is a comparatively

simple process, involving one continuous operation. They are cut out directly from a ream of paper, 500 at a time, or in larger numbers if the paper is thin. This is accomplished by a steam-driven die. (See DIES AND DIE SINKING.) The blanks, thus cut, are automatically fed into the machine, where they are gummed, one by one, by the gum picker, which is fed with gum by means of rollers and applied to the margin of each blank. The blank is next carried on to the folding box, where folders press down the four flaps, but do not fasten down the upper one. The envelope is now carried on by an endless chain, and during its transit the loose flapper is dried. The finished envelopes are deposited in bunches of 25 by the endless chain, and, after being banded with a narrow strip of paper, are ready for shipment. By this process from 5000 to 6000 envelopes per hour can be made by a single machine.

During the closing years of the nineteenth century there was a remarkable development of labor-saving devices for office use. Among these inventions are various improvements on the ordinary gummed envelope. In the so-called "window envelope" the paper is either made transparent by wax or oil so as to render visible the address on the letter inclosed or an opening of appropriate size is covered by transparent paper with the same end in view. The position of the address on the letter as well as the size of the sheet and the manner of folding are so regulated as to bring it behind the opening, thus obviating the necessity for addressing the envelope, a time-consuming occupation. In another form of envelope a wire or thread is so attached to the inner edge of the envelope that by pulling it at either end the envelope is neatly torn open without the use of a knife. Then there are various devices for fastening together envelopes which are intended for inclosing second-class or unsealed mail or simply for filing purposes. Among these patented devices are numerous clasp fasteners, like those in which a thin narrow strip of flexible metal is attached to the body of the envelope and, for fastening, passes through an eyelet in the flap and is bent over; or those in which a cord attached to one eyelet is wound around a second eyelet; or others where a paper tongue passes through a slit in a flap. An envelope for mailing third-class matter, like circular letters, so as to have the appearance of first-class mail, is made by leaving ungummed a portion of the flaps, so the contents may be inspected. Expansive envelopes for filing purposes are made with fluted ends that fold over each other, so the envelope occupies but little space until it becomes well filled. At the end of 1909 there were 78 envelope manufacturing establishments, employing 5303 operatives. The value of their output was \$13,453,522.

ENVELOPES. See CURVE.

ENVER PASHA. Turkish War Minister. For biography see SUPPLEMENT.

ENVOI, ɛn'vwa', or **ENVOY**, ɛn'voi. The concluding stanza of a ballade or of other conventional verse forms. See BALLADE.

ENVOY (OF. *envoy*, Fr. *envoi*, message, from *envoyer*, It. *inviare*, to send, from Lat. *in*, in + *via*, way; connected with Lat. *vehere*, to carry, Gk. *ἔχειν*, *echein*, to have, Skt. *val*, Av. *raz*, to carry, Goth. *reiga*, OHG. *reio*, Ger. *Weg*, AS. *weg*, Eng. *way*). In international law, a diplomatic agent of the second order, next in

rank to an ambassador. An envoy stands to his sovereign just as an agent does to his principal, and his acts or promises are the sovereign's in a business sense, though not in a personal sense. It is said that this class of diplomatists was first introduced by Louis XI of France in the second half of the fifteenth century. The envoy is superior in rank to the chargé d'affaires, whose credentials proceed from a minister of the state from which he is sent and are addressed to the minister of the state to which he is sent, or are a mere delegation from an ambassador or envoy to conduct the affairs of the mission in his absence. The practice of the United States has interjected between the ambassador and the envoy a second class, called envoys extraordinary and ministers plenipotentiary, which, of course, throws the ordinary envoy into the third class. See AMBASSADOR; CHARGÉ D'AFFAIRES; CONSUL; DIPLOMATIC AGENT; EMBASSY; MINISTER.

ENZINA, ɛn-thē'nā, JUAN DEL. See ENCINA.

ENZINAS, ɛn-thē'nās, FRANCISCO DE, also called DRYANDER (1520-53). Author of a Spanish translation of the New Testament. He was born at Burgos, studied in Louvain (1539-41), and then in Wittenberg, where he lodged in Melancthon's house. Here he translated the New Testament from the Greek and presented a copy (printed at Antwerp, 1543) to Charles V. He was imprisoned in Brussels for his heretical views. After a little more than a year he escaped and returned to Wittenberg. Next to the translation of the New Testament, his most important work is a *History of the State of the Netherlands and of the Religion of Spain*, published first in Latin, and then reprinted in French by François Duchesne (Geneva, 1558), and again republished by Campan under the title *Mémoires de Francisco de Enzinas (Dryander)* (3 vols., Brussels, 1862-63). Consult title Menéndez y Pelayo, *Historia de los Heterodoxos españoles*. In 1548 he was made professor of Greek at Cambridge by Cranmer. Accounts of his death vary, some claiming that he died of the pest at Strassburg in 1553, and others claiming that we lose track of him at Geneva in 1570. His brother, Jaime, was burned as a heretic in Rome in 1546.

ENZIO (c.1225-72). A king of Sardinia, a natural son of the German Emperor Frederick II. He fought by his father's side against the Lombards at the battle of Cortenuova, in 1237, and in the following year was married to Adelmia, widow of Ubaldo Visconti, and given the title of King of Torres and Gallura and later that of King of Sardinia. In 1241, the command of the fleet having been intrusted to Enzo, he gained a splendid victory over the Genoese and captured 100 prelates on their way to a council at Rome. Enzo was afterward sent into Lombardy, which was for several years the scene of his chief exploits. In 1248 he besieged Parma, but was forced to retire. He then besieged Colonna, and in 1249 took the castle of Arola, but on May 26 of the same year he was taken prisoner at Fossalta by the troops of Bologna and consigned to perpetual imprisonment. His capture was a great blow to the cause of the Hohenstaufen. Enzo died March 14, 1272. His great talents as a warrior and poet, his sad lot, his beauty, and the fate of his family have received much sympathetic treatment in history and literature. Consult Blasius, *König Enzo* (Breslau, 1884), and Jordan, *Les origines*

in the protoplasm which is about to form enzymes, and under appropriate conditions are transformed into enzymes, disappearing as the enzymes increase.

A few of the better-known enzymes, their distribution, the substances they attack, and the chief products of their action are shown by the following table:

ENZYME	Occurrence	Substances attacked	Product of the action
<i>Diastase</i> ¹	All plants.....	Starch.....	{ Maltose, Dextrin.
<i>Inulase</i>	Composites, etc.....	Inulin.....	Fructose.
<i>Cytase</i>	Many plants.....	Cellulose.....	Sugars (?)
<i>Invertase</i>	Many plants.....	Saccharose.....	{ Glucose, Fructose.
<i>Maltase</i>	Many plants.....	Maltose.....	Glucose.
<i>Zymase</i> ¹	Yeasts.....	Sugars.....	Alcohol, Carbon dioxide.
<i>Lactase</i>	Kephir.....	Lactose.....	Glucose, Galactose.
<i>Trehalase</i>	Several fungi.....	Trehalose.....	Glucose.
<i>Raffinase</i>	Molds, yeasts.....	Raffinose.....	{ Glucose, Fructose, Galactose.
<i>Melizitase</i>	Molds.....	Melizitose.....	Glucose, Touranose.
<i>Emulsin</i>	Rosaceæ, Euphorbiaceæ, Fungi.	Various glucosides.....	Glucose, Various subs.
<i>Myrosin</i>	Crucifere.....	Sinigrin.....	Glucose (see above).
<i>Erythrozyme</i>	Madder plant.....	Rubian.....	Glucose, Red pigment.
<i>Rhamnase</i>	<i>Rhamnus infectorius</i>	Xanthorhamnin.....	Glucose, Rhamnin.
<i>Gaultherase</i>	Wintergreen, etc.....	Gaultherin.....	Glucose, Wintergreen oil.
<i>Papain</i>	<i>Carica papaya</i>	Proteids.....	Proteoses, Peptones, etc.
<i>Bromelin</i>	Pineapple.....	Proteids.....	Proteoses, Peptones, Amides.
<i>Trypsin</i> ¹	{ Germinating seeds } { Carnivorous plants }	Proteids.....	Peptones, Amino- acids.
<i>Lipase</i>	Oily seeds.....	Fats.....	Glycerin, Fatty acids.
<i>Reonet</i>	Various plants.....	Casein (?).....	Coagulates milk.
<i>Pectinase</i>	Acid fruits and various leaves.....	Pectin, etc.....	{ Pectic acid. Forms jelly.
<i>Laccase</i>	Lac plants, etc.....	Laccol.....	Oxidizes it.
<i>Tyrosinase</i>	Russula, beet, dahlia.....	Tyrosin.....	Oxidizes it.
<i>Alcoholase</i>	Acetic acid organism.....	Ethyl alcohol.....	Acetic acid.
<i>Lactolase</i>	Lactic.....	Glucose.....	Lactic acid.
<i>Catalase</i>	Universal.....	H ₂ O ₂	H ₂ O and O ₂ .
<i>Mutase</i>	General.....	Aldehydes.....	Alcohol and acid.

¹ The total effect is probably due to the action of two enzymes. Diastase consists of amylase, which hydrolyzes starch to dextrin, and dextrinase, which hydrolyzes dextrin to maltose. Zymase consists of zymose, which transforms the sugar to lactic acid, and lactisidase, which transforms lactic acid to alcohol. Trypsin consists of protease, giving peptones, and ereptase, producing amino acids.

The enzymes whose names are italicized in the above table are described in special articles in this encyclopædia.

EOANTHROPUS DAWSONI. See MAN, ANCIENT TYPES.

E'OBANUS, HELIUS, also called **HESSUS** (1488-1540). A German humanist. His name properly was Eoban Koch. He was born in Hesse, probably at Halgehausen. He led the wandering life of so many scholars of that period, teaching, lecturing, and writing in different places. He identified himself with the Reformation and showed his humanistic sympathies by participating in the famous *Epistolæ Obscurorum Virorum*, and his scholarship and poetical ability in his translations of Ecclesiastes (1532) and the Psalms (Marburg, 1537), whence his epithet "the Hessian David." For his life, consult Krause (Gotha, 1879).

E'OCENE EPOCH (from Gk. *hḗs, ḗs*, dawn + *kaînos, kaînos*, new). A division of geologic time following the Cretaceous period and marking the beginning of the Cenozoic era. At the end of the Cretaceous period great geographical changes occurred in both Europe and North America, by which the floor of the inland seas

was raised partly into land and partly into shallow waters. This elevation took place slowly and occupied a long interval of time, so that when the Eocene period opened the fauna and flora had assumed a decidedly modern aspect. Among invertebrates the ammonites, which were characteristic of the Mesozoic era, declined in importances, while bivalves, such as the oyster,

clam, and scallop, common at the present day were very numerous. Ganoid fishes became sub ordinate to the teleosts, which included perch, herring, and sharks, and mammals predominated over reptiles. In rocks of this period have been found the remains of *Hyacotherium*, the earliest-known ancestor of the horse. The vegetation included dicotyls, palms, and grasses belonging to genera living at the present time. Eocene rocks in the United States are found along a belt that extends parallel to the Atlantic coast from New Jersey to Florida, where they overlie the Cretaceous unconformably and dip slightly towards the sea, disappearing beneath younger beds. They also occur in the Mississippi valley, in the Gulf States, and in California, Oregon, and Washington. There are numerous basins also in the Rocky Mountain region of Utah, Wyoming, Colorado, North Dakota, and New Mexico, which, unlike the preceding, were deposited in fresh water. The most important of these basins are the Puerco, Wasatch, Green River, and Uinta. In the Uinta basin the deposits are 6000 to 8000 feet thick. The following division of the Eocene is recognized by American geologists: Atlantic and Gulf States:

(a) Midway, (b) Lignitic, (c) Lower Claiborne, (d) Claiborne, (e) Jackson, (f) Vicksburg; Western States: (a) Fort Union, (b) Wasatch, (c) Wind River, (d) Bridger, (e) Uinta. The rocks of the Eocene include clays, sands, limestones, and sandstones, while among the economic minerals are marls in the Atlantic States, phosphate rock in Florida, petroleum in California, and brown coal in Washington. Consult "Correlative Papers—Eocene," *United States Geological Survey Bulletin*, No. 83 (Washington, 1891); Report on "Eocene," *Maryland Geological Survey Publications* (Baltimore, 1901); Chamberlin and Salisbury, *Geology*, vol. iii (New York, 1907). See TERTIARY SYSTEM; GEOLOGY.

EON. See ÆON.

ÉON, a'ON', CHARLES DE BEAUMONT D' (1728-1810). A French diplomatist, commonly known as the Chevalier d'Éon, who owes his celebrity to doubts as to his sex. He was born at Tonnerre, Burgundy, and practiced as an advocate in Paris. He published in 1753 some important works on history and political economy which attracted the attention of Louis XV, who sent him in 1755 on a diplomatic mission to Russia, where he assumed the dress of a woman, gained the favor of the Empress Elizabeth, and negotiated an advantageous treaty. After serving with the French army in Germany in 1759, he was made Minister Plenipotentiary to London (1763), and stood so high in favor with the King as to incur the jealousy of Madame de Pompadour, who brought about his dismissal. He was granted a large pension by the King in return for keeping diplomatic secrets and took up literary work. On his return to France (1777) the government, for reasons which have never been made known, required him to assume the female dress, which he wore for the remainder of his life. This fact gave rise to doubts as to his sex, which were not settled until his death. On the outbreak of the French Revolution he offered his services to the French nation, but they were declined, and he passed the rest of his days in poverty in England. The Chevalier d'Éon was the author of many historical and political essays which were published under the title of *Loisirs du Chevalier d'Éon* (Amsterdam, 1775). The *Mémoires* attributed to him and edited by Gaillardet (Paris, 1836) are not genuine. Consult: Telfer, *The Strange Career of the Chevalier d'Éon de Beaumont* (London, 1886); Hoff, *Merkwürdiges Leben des ehemaligen Ritters von Éon* (Leipzig, 1870); Madame Campan, *Mémoires*; Bachaumont, *Mémoires*; La Fortelle, *Vie militaire, politique et privée de demoiselle C.G.L.A.A.T. Éon ou d'Éon* (Paris, 1779).

EON, or EU'DO DE STELLA, or ÉON DE L'ÉTOILE, a'ON' de la'twāl'. A religious fanatic of noble birth, who lived in Brittany in the twelfth century and claimed to be the final judge of mankind. He is said to have applied to himself the pronoun *eum*, in the familiar liturgical formula, *per eum qui venturus est iudicare vivos et mortuos*, 'through Him who

will come to judge the quick and the dead,' whence his name, *Éon*. He opposed the hierarchy of the church, although he did not hesitate to construct a new one of his own, ordaining his followers as bishops and archbishops. His enthusiastic adherents went forth to plunder and destroy churches and monasteries. In Éon himself miraculous powers were believed to reside. He was publicly opposed at Nantes by the Cardinal Legate, Alberic, and Hugo, Archbishop of Rouen, wrote a book against him, *Dogmatum Christianæ Fidei*. In 1148 he was seized, along with some of his leading adherents, and brought before a synod at Rheims for trial. He was adjudged insane and thus escaped execution, but he was imprisoned for the rest of his life, and some of his followers were burned at the stake. His sect soon died out. There is little ground for the commonly accepted opinion that Éon belonged to the Cathari. Consult H. C. Lea, *History of the Inquisition of the Middle Ages*, vol. i (New York, 1888), and Döllinger, *Beiträge zur Sektengeschichte des Mittelalters*, vol. i (Munich, 1890).

EOS. See AURORA.

EOSCORPIUS, ē'ō-skōr'pī-ūs (Neo-Lat., from Gk. ἥως, ēōs, dawn + σκορπιός, skorpīos, scorpion). A fossil scorpion which is characterized by a slender form, parallel sides of the carapace, and slender hand and pincers. Four separate species have been found in the Carboniferous fossil locality at Mazon Creek, Ill., celebrated for its nodules with plant and animal remains. See SCORPION.

EOSIN. See COAL-TAR COLORS.

EOS'TRA. The Teutonic goddess of Spring, the name of whose festival, it is supposed, has been transferred to the Christian Easter (q.v.).

EÖTVÖS, ē'tvësh, JÓZSEF, BARON (1813-71). A distinguished Hungarian statesman and author, who has left a lasting imprint upon both the literary and political life of his country. He was born at Buda, studied philosophy and jurisprudence at the University of that city, and when barely 20 entered upon an official career as vice notary at Pressburg, but soon abandoned it in favor of literary pursuits. He had already attracted some attention through a translation of Goethe's *Götz von Berlichingen* (1830), two comedies, *Kritikusok* (The Critics) and *Idácasulók* (The Matrimonially Inclined), and a tragedy, *Boszú* (Revenge). After an extended tour through Germany, France, England, Switzerland, and the Netherlands, he returned to his father's estate and there devoted himself to writing his famous novel *Karthausi* (The Carthusian), which was at once hailed with delight by the public and critics alike (1842). About this time Eötvös began to be prominent in politics. When the Liberal party became divided, in 1844, into Municipalists and Centralists, he became, as member of the House of Magnates, one of the most earnest supporters of the latter party, and a frequent contributor to Kossmuth's organ, the *Pesti Hírlap*, his stirring articles being later collected in a volume under the title *Reform* (Leipzig, 1846). Quite in line with his active interesting public reforms is the theme of his second romance, *A Falu Jegyzője* (The Village Notary), in which he painted the abuses growing out of the old system of public administration in Hungary, based upon county elections, and which enjoyed no less vogue than his earlier novel. It has been translated into German by Mailáth, and into English by Otto

Wenckstern (1850). It was followed, in 1847–48, by his *Magyarország 1514-ben* (Hungary in 1514), an historical romance.

Upon the formation of the national Hungarian ministry, after the revolution of March 15, 1848, Eötvös was appointed Minister of Public Instruction, but after the stormy scenes of the following September resigned his office and retired to Munich, where he lived for three years, and where his literary labors bore important fruit in the form of a philosophical work, in German and Hungarian, upon *The Influence of the Ideas of the Nineteenth Century upon State and Society* (1851–54). He returned to Hungary in 1851, was made vice president of the Hungarian Academy in 1855 and president in 1866. In 1861 he reentered political life, founded in 1865 the *Political Weekly* (*Politikai Hetilap*), and in 1867 became once more Minister of Public Instruction, an office which he filled until his death and which gave him the opportunity of introducing salutary reforms. His works were published in 1870 in 14 vols. and a new edition was undertaken in 1891. Consult: Schwicker, *Geschichte der ungarischen Litteratur* (Leipzig, 1889); Kont, *Geschichte der ungarischen Litteratur* (ib., 1906); in Hungarian, the life by Z. Ferencsi (1903).

EÖTVÖS, ROLAND, BARON (1848–). An Hungarian scientist and statesman, born at Budapest. He obtained his scientific training at the universities of Königsberg and Heidelberg and was appointed a lecturer at Budapest in 1871 and in 1873 professor of experimental physics there. In 1873 he became connected with the Hungarian Academy of Sciences, of which he was elected president in 1889. His investigations respecting gravitation and capillary attraction were described by him in various learned journals and made him well known in scientific circles. He also became a life member of the Hungarian House of Magnates and in 1895–96 held the difficult post of Minister of Public Worship and Education.

E'ZOZ'ÖN (Neo-Lat., from *hḗs, ῥῶs*, dawn + *ζῶν, ζῶν, animal*). A supposed fossil organism found in the crystalline metamorphic limestones of the Archean Laurentian series of the lower St. Lawrence valley. Eozoön occurs mostly in the form of concentric layers of the mineral serpentine, constituting concretionary masses in the limestone and approximating in structure some of the hydroid corals, such as *Stromatopora*. It was originally described by Sir J. W. Dawson, as a gigantic foraminiferan, and several papers in support of his contentions regarding the object were published by him. Other similar objects were afterward found in rocks of equivalent age in Bavaria. The researches of Müblius and others have tended to disprove the organic nature of Eozoön, and it is now generally considered to be nothing more than a mineral concretion or segregation.

E'PACT (Gk. *ἐπακτός, epaktos*, added, intercalated, from *ἐπάγειν, epagēin*, to add, from *ἐπ, ἐπί, upon* + *ἀγειν, agēin*, to lead). A number varying for each year, employed in the ecclesiastical calendar for fixing the dates of the ecclesiastical new moons. These dates differ sometimes as much as three days from those of the actual or "astronomical" new moons.

Briefly stated, the epact for any year may be defined as the number of days elapsed at the beginning of the year since the preceding new moon. The epact once known, it is therefore

easy to calculate the dates of all the following lunar phases throughout the year.

To calculate the epact for any year, it is first necessary to know the "golden number" (q.v.). This is found by the following rule: Add 1 to the date of the year, and divide by 19; the remainder is the golden number; when the remainder is 0, the golden number is 19. Knowing the golden number, the epact can then be taken from the following table. For instance, when the golden number is 13, the epact is 12 for years from 1700 to 1899, and 11 for the years between 1900 and 2199:

TABLE OF EPACTS

GOLDEN NUMBER	1700 to 1899	1900 to 2199	GOLDEN NUMBER	1700 to 1899	1900 to 2199
1.....	80	29	11.....	20	19
2.....	11	10	12.....	1	30
3.....	22	21	13.....	12	11
4.....	3	2	14.....	23	22
5.....	14	13	15.....	4	3
6.....	25	24	16.....	15	14
7.....	6	5	17.....	26	25
8.....	17	16	18.....	7	6
9.....	28	27	19.....	18	17
10.....	9	8			

EPAMINONDAS (Lat., from Gk. *Ἐπαμεινώνδας*, or *Ἐπαμεινώνδας*) (c.418–362 B.C.). A Greek statesman and general. He was born at Thebes, of an influential though not wealthy family. He spent his early life in study as a pupil of the Pythagorean philosopher Lysis of Tarentum, who, exiled from home, lived with the father of Epaminondas. When the Theban democracy was established, he came forward as one of its strongest supporters. He was a member of the deputation sent by Thebes to the congress of Grecian states held at Sparta in 371 B.C. and spoke on that occasion in defense of the Theban policy of maintaining a united Boeotia. War was, in consequence, straightway declared by Sparta. Epaminondas was appointed commander in chief of the Theban army, which consisted of about 6000 men. The Spartans, though they had a much larger force, were defeated at Leuctra in the early part of July, 371 B.C.; the victory was due mainly to Epaminondas' skillful handling of the hoplites, or heavy infantry. (See PHALANX.) The supremacy of Sparta was now at an end. In 370 B.C. Epaminondas and Pelopidas invaded the Peloponnesus and attacked Sparta, which successfully defended itself under the lead of Agesilaus (q.v.). Epaminondas, however, restored Messenia to its former position as an independent state (369 B.C.); under his auspices, too, Megalopolis was founded as the centre of the Arcadian Confederacy. In 368 B.C. Epaminondas made a second expedition into the Peloponnesus and in 366 a third. In 362 he undertook a fourth expedition, having this time a coalition of Sparta and a number of states opposed to him. He fought a great battle at Mantinea (q.v.), in which the Thebans were successful, but Epaminondas himself fell. Epaminondas was one of the purest and noblest characters in Grecian history. His life was written by Cornelius Nepos. Consult: the life by Cornelius Nepos (q.v.); Du Mesnil, "Ueber den Werth der Politik des Epaminondas," in *Historische Zeitschrift* (Berlin, 1863); Pomtow, *Das Leben des Epaminondas* (Berlin, 1870); Pöhlman, *Grundriss der griechischen Geschichte* (4th ed., Munich, 1914).

EP'ARCH (Gk. *ἐπαρχος*, *eparchos*, governor, from *ἐπὶ*, *epi*, upon, over + *ἀρχή*, *archē*, rule, from *ἀρχεῖν*, *archein*, to rule). In ancient Greece, the governor of a province, the commander of ships or of troops, etc. In Roman times the word was used in Greek provinces of Rome as the equivalent of *praefectus*. (See **PREFECT.**) The district governed by the eparch was called an *eparchy*. In modern Greece the eparchy is one of the parts of a nomarchy and is itself divided into demarchies. (See **NOMARCHY.**) In Russia the term has an ecclesiastical use and denotes the diocese or archdiocese of a bishop or archbishop of the Greek church.

EPAULEMENT, *ê-pal'ment* (Fr., from *épaule*, shoulder, from Lat. *spatula*, blade, shoulder). A part of siege or covering works in military fortification. Siege batteries are usually shielded by epaulements built so as to form an obtuse angle with the main line of the battery, protecting guns and gunners from flank fire. Practically an epaulement is any screen used for the protection of troops. See **FORTIFICATION; SIEGE AND SIEGE WORKS.**

EP'AULET (Fr. *épaulette*, dim. of *épaule*, shoulder). An ornamental shoulder badge of rank, formerly in very general use throughout the armies and navies of the world—a survival of the metal shoulder piece of mediæval days. Epaulets were worn by commissioned officers in the United States army as late as 1872, when they were replaced, in all uniforms save those of general officers, by shoulder knots. At the present time in the United States army epaulets are worn only by general officers in dismounted full-dress uniform. In the British army they were worn up to 1855 by all ranks, the officers' epaulets being of gold and those of the rank and file of worsted. Epaulets are worn generally in the navies of all nations by commissioned officers as a part of the full-dress uniform. They are usually of gold bullion and bear the significant marks of the officer's rank. See **UNIFORMS, MILITARY AND NAVAL.**

ÉPÉE, *ê-pâ'*, CHARLES MICHEL, ABBÉ DE L' (1712-89). One of the founders of the system of instruction for the deaf and dumb. He was born at Versailles, France, Nov. 26, 1712. He became a priest and canon at Troyes, but eventually, on account of his Jansenist opinions, was deprived of this appointment and went to live in retirement in Paris. About 1765 he began to occupy himself with the education of two deaf and dumb sisters, using a system of signs. His first attempt being crowned with success, he determined to devote his life to the subject. At his own expense he founded (1770) an institution for the deaf and dumb, but his favorite wish, the foundation of such an institution at the public cost, was not fulfilled till after his death, which took place Dec. 23, 1789. He wrote a work entitled *Institution des sourds et muets* (2 vols., Paris, 1774), which afterward appeared in an improved form, under the title *La véritable manière d'instruire les sourds et muets* (Paris, 1784).

EPEIRIDÆ, *êp-y'ri-dê* (Neo-Lat. nom. pl., from Gk. *ἐπί*, *epi*, upon + *εἶπος*, *eîpos*, wool; so called from their web). A family of spiders, the so-called orb weavers, which includes many of our commonest and most frequent spiders. See **SPIDER.**

EPIROGENIC MOVEMENTS, *ê-pî-rô-jên'ik*. In geology the slow crustal uplifts or

subsidiences which involve large tracts of continental lands. As they are necessarily measured from sea level, they may mean an actual change in the oceanic basins rather than a movement of the land surface. They differ from mountain-making processes (orogenic movements) in that they are unaccompanied by folding of the strata, the evident result of lateral compressive strains. See **ELEVATION; SUBSIDENCE.**

EPERIES, *â-pâ'rê-ès*, Hung. **EPERJES**, *ê-pêr-yêsh* (ML. *Eperesinum*, Slav. *Presšov*). The capital and an episcopal city of the County of Sáros, in Hungary, situated on the left bank of the Tarcza, about 190 miles northeast of Budapest (Map: Hungary, G 2). In 1887 it was totally destroyed by fire except its ancient walls and fortifications, but it has been largely rebuilt. Among the chief public buildings are the Gothic church of St. Nicholas, the Franciscan abbey, the bishop's palace, military barracks, the county building, chapter house, town hall, and theatre. Eperies is the seat of a Greek Catholic bishop and of a Royal Court of Justice. Its educational institutions include a Lutheran college, a royal Catholic gymnasium, a girls' school, a seminary, and a library of over 30,000 volumes. There are manufactures of earthenware, linen cloth, and flannel, and a considerable trade in grain, wine, and cattle. In the vicinity are the royal salt works of Sôvár, the bathing resort, Czeméte, which belongs to Eperies, and the opal mines of Vörösvágas, 6 miles from Eperies and the only opal mines in Europe. From these mines was obtained one piece weighing 2940 carats, valued at about \$750,000, and now preserved in the court museum at Vienna. Eperies was colonized by Germans in the thirteenth century and was made a royal free city in 1374. The inhabitants, who became Protestants in the sixteenth century, suffered bitter persecution, especially in the year 1687, when the Imperialist general Caraffa instituted the famous Bloody Tribunal for the trial of recusants. Eperies was celebrated for its schools in the sixteenth and seventeenth centuries. Pop., 1900, 14,447; 1910, 16,323.

ÉPERNAY, *ê-pâr-nâ'*. The capital of an *arrondissement* in the Department of Marne, France, situated in the midst of the champagne district, on both banks of the Marne, 88 miles by rail from Paris (Map: Northern France, J 3). The chief part of the town on the left bank is well built, with many fine villas in the suburbs. It manufactures earthenware from a clay obtained near by and called *terre de Champagne*; also hosiery, refined sugar, hats, caps, and leather. The Eastern Railway maintains large workshops here. It has a brisk trade in bottles, corks, and wire, and is the chief centre of the champagne trade. Large storage cellars have been hollowed out of the chalk rock. Pop. (commune), 1901, 20,478; 1911, 21,811. Épernay is the ancient Sparrnacum and the Roman *Aquæ Perennæ*. Francis I burned it in 1544 to defeat the attempt of Charles V to obtain possession of its wine stores. In 1592, during the wars of the League, it was captured by Henry IV, Marshal Biron being killed during the attack.

ÉPERNON, *ê-pâr-nôn'*, JEAN LOUIS DE NOGARET, DUC D' (1554-1642). A French courtier, originally called Caumont and LaNalette. In 1573 he identified himself with the fortunes of Henry III, whose most influential favorite he

became, and who bestowed upon him wealth and titles, including the newly created Duchy of Epéron (1581) and the admiralty of France. He was originally a defender of absolute monarchy, hostile towards any concession to the estates, and the foe most dreaded by the Catholic League. In 1587 he was appointed Governor of Normandy, but in 1588 the league persuaded the King to send him into exile at Loches. Despite this he remained faithful to the crown. In 1596 he was made Governor of Limousin by Henry IV, and in 1622 was transferred to Guienne. Meanwhile his political attitude had diametrically changed, and he had become the boldest exponent of the independence of the provincial noblesse. He opposed the concentration policy of Richelieu, by whom he was finally banished to Loches in 1641. In 1610 he had helped give the regency to Marie de' Medici. Consult the biography by Montbrison (Paris, 1874).

EPHAE (Heb. *ephah*, Copt. *ēpi*, from Copt. *ēpi*, to measure, *ēpi*, to count). A dry measure of the ancient Hebrews. It contained 10 omers or three seahs—about four English pecks.

EPHARMONY (from Gk. *ἐπι*, *epi*, upon + *ἀρμονία*, *harmonia*, harmony, from *ἀρμόζειν*, *harmozein*, to fit). The state of the adapted plant, as manifested in the plant form. See *ECOLOGY*.

EPHEBUS (Lat., from Gk. *ἐφηβος*, from *ἐπι*, *epi*, upon + *ἡβη*, *hēbē*, youth, puberty). Among the ancient Greeks, a youth of the upper classes who has just attained manhood, which was commonly reckoned to commence at the sixteenth year. In Athenian constitutional law it denoted one who had attained his majority, but was not yet a full citizen, i.e., one who had begun his eighteenth, but had not attained his twentieth year. These ephēbi entered upon their civic manhood by taking an oath of allegiance and devotion to the fatherland in the temple of Aglauros and for the next two years were trained in military exercises and employed in garrison and patrol duty. When this custom was introduced is not certain, but in a rudimentary form it is likely to have existed from the time of the Persian wars. In the latter part of the fourth century B.C., probably soon after the battle of Cheronea (338 B.C.), the institution was put on a firmer basis, which is described by Aristotle in his work on the Constitution of Athens (chap. xlii). At the head was a *cosmētēs* (*κοσμητής*), elected by the Assembly; the ephēbi of each tribe were under the direct supervision of a *sōphronistēs* (*σωφρονιστής*), who was elected by the people from three men over 40 years of age, nominated by the fathers of the boys. The first year of the ephēbus' training was given to instruction in gymnastics, the drill and weapons of heavy and light-armed infantry, and the management of the artillery engines. At the end of the year they received a shield, spear, and military cloak (see *CITLAXMS*) from the state and were assigned to garrison duty in Attica and police duty at the Assembly (see *ECCLĒSIA*). After the fourth century the institution underwent many changes, which are reflected in the numerous inscriptions in praise of the ephēbi and their officers, which may be found in the *Corpus Inscriptionum Atticarum* (vols. ii and iii). More and more the military side of the training sank into the background, and the compulsory character disappeared, so that it finally became a state system of education for the sons of the wealthy. Foreigners, too, were admitted. The ephēbi had their own gymnasia,

with baths and apparently libraries attached, and there was also a special gymnasium, the Diogeneion, for boys under 16 who were preparing to enter on the ephēbic course. Full details of this interesting institution, which was imitated in other Greek states, can be found in Dumont, *L'Ephēbie attique* (Paris, 1875); Girard, in Daremberg and Saglio, *Dictionnaire des antiquités* (Paris, 1892); Dittenberger, *De Ephebis Atticis* (Göttingen, 1863); Grasberger, *Erziehung und Unterricht im klassischen Altertum*, vol. iii (Würzburg, 1881); Girard, *L'Éducation athénienne au Ve et IV^e siècle avant J. C.* (2d ed., Paris, 1891); Gilbert, *The Constitutional Antiquities of Sparta and Athens* (Eng. trans., London, 1895); Bryant, "Boyhood and Youth in the Days of Aristophanes," in *Harvard Studies*, vol. xviii, pp. 73-88 (1907); Walden, *The Universities of Ancient Greece* (New York, 1909).

EPH'EDRA. A genus of gymnosperms including about 30 species of low straggling shrubs, with long, jointed, and fluted green stems, and minute scalelike leaves forming a sheath at each joint. The whole habit of the plant is suggestive of a shrubby *Equisetum*. The species grow in the arid regions about the Mediterranean and also in tropical to temperate Asia, North America, and South America. The stamens and ovules are borne in cones that arise from the joints of the stem, some of the cones bearing only stamens and others only ovules. Each cone consists of broad, overlapping membranaceous bracts. In some species the fruit is decorative. Being somewhat susceptible to frost, the members of this genus are little grown except where they are not likely to suffer from cold. They succeed best upon dry, sandy, and rocky slopes, and are easily propagated by seed, suckers, or layers. For illustration, see *Gymnosperms*.

EPHEM'ERA (Neo-Lat., from Gk. *ἐφήμερα*, daily, from *ἐπι*, *epi*, upon + *ἡμέρα*, *hēmera*, day), or **FEBBIS DIARIA**. See *FEVER*.

EPHEMER'IDA (Neo-Lat., from Lat. *ephemeris*, Gk. *ἐφήμερος*, journal, from *ἐφήμερος*, *ephēmeros*, daily). An order of insects, allied to the dragon flies and noted for their very brief existence as adults; hence they are often called day flies. See *MAX FLX*.

EPHEMER'IS (Lat., from Gk. *ἐφήμερος*, journal). A name applied to astronomical almanacs, containing data for each day. It is mostly confined to astronomical tables giving the daily places of the sun, moon, planets, and fixed stars, together with other phenomena of the heavens. The most important works of the kind at present are published under governmental supervision. They include the French *Connaissance des Temps*, the English *Nautical Almanac*, the Berlin *Astronomisches Jahrbuch*, and the American *Ephemeris and Nautical Almanac*. See *ALMANAC*.

EPH'ESI'ACA (Lat., from Gk. *Ἐφεσιακά*, *Ephesiaka*, relating to Ephesus, from *Ἐφεσος*, *Ephesos*, Ephesus), or **EPHESIAN TALES**. A Greek romance by Xenophon of Ephesus, relating the love story of Abrocomas and Anthia. In this tale is found the earliest source of the story of Romeo and Juliet.

EPHESIAN LITTERÆ. See *EPHESUS*.

EPHESIANS, *e-fē'zhanz*, **EPISTLE TO THE**. One of the Epistles of the Apostle Paul. It is addressed, according to the common text, to the Christians at Ephesus, once the principal city of western Asia Minor. The question of its

authorship, however, is debated, necessitating a careful study of the material which it presents. Assuming, as a working hypothesis for such study, the claim of Paulinity involved in the Epistle's address (i. 1), the following facts would seem to be clear: 1. A generality of tone involving a larger circle of readers than any one individual church. 2. The apparent lack of personal acquaintance on the part of the Apostle with the readers of the Epistle, which strongly militates against the theory of the common text that the Epistle was written to the church of Ephesus, a church founded by Paul and his friends (Acts xviii. 19 ff.) and built up by him on his third missionary journey, when he had his headquarters at Ephesus for over two years (52-55 A.D.; cf Acts xix). The additional fact that the Epistle contains no personal greetings or salutations also tells strongly against the theory that it was addressed to the church at Ephesus. 3. A striking resemblance in word and phrase to Colossians, leading to the inference of a contemporaneous date with that of this Epistle. 4. An evident imprisonment on the part of the Apostle (iii. 1), and an imprisonment which, in its freedom to preach and its opportunity for service (vi. 18-20), shows resemblance to the lenient conditions of his Roman imprisonment, narrated in Acts and referred to in the Epistles to the Colossians, Philippians, and Philemon. 5. The theme (the ideal unity of the Church in Jesus Christ supreme) appears to be a most natural development of the theme of Colossians (the exaltation of Jesus Christ as supreme), and a not unlikely outcome of the dominant thought of the Epistle to the Romans (the community between the Jewish and Gentile elements in the Church). These facts agree quite significantly with the Epistle's claim and render the assertion of its inconsistency with itself difficult of proof. Confirmation of these facts is further rendered by the strong witness borne to the Epistle as a product of the Apostle by external evidence from the time of Marcion (140 A.D.) down.

Over against all this there does not seem to be much force in the contention that the large element of catholicity in the Epistle would indicate a postapostolic date, since the catholicity which the Epistle presents becomes simply a consistent development of Paul's own ideas, reaching its climax in this encyclical message to the churches of a region which had been brought under the influence of his three years' work at Ephesus. It is of still less force to call attention to the peculiarities of word and phrase and general style in the Epistle, especially as these peculiarities find to a large extent their counterpart in the companion Epistle to the Colossians, which is admitted to be Paul's.

Accepting then the Pauline origin of the Epistle, it becomes a most interesting question how the title Ephesians came to be attached to it, in particular how "at Ephesus" came to be incorporated in the address (i. 1), there being no local Ephesian color in the Epistle and no salutations in it to members of the Ephesian church. The significance of this question is heightened by the fact that the documentary evidence is scarcely in favor of the phrase being part of the original text. The early and more important manuscripts omit it, while not a few of the early fathers show they did not read it in their copies of the letter. On the

other hand, the assigning of this Epistle to Ephesus is continuous and universal in the Church from the time of Irenaeus (180 A.D.). How came this tradition if "at Ephesus" was lacking in the text from the beginning? The answer to this question seems to rest between two theories. The one assumes that Paul wrote the letter to a group of churches with which he was not personally acquainted, situated outside of Ephesus, the association of the Epistle with this city coming from the natural drift of the original manuscript to this metropolitan centre and its preservation there (Zahn), the name of the less-known church which it must have contained being finally removed for that of the larger one (Julicher). The other theory is that Paul wrote the letter to a group of churches of which Ephesus was the leading one, but all local references to which were laid aside because of the general character of the letter (A. Robertson), phrases being substituted which would agree with the fact that with the larger number of the group he was personally unacquainted. In this case the original manuscript would have had "at Ephesus" in the text, since the letter went in the first instance to the parent church; but from the copy made for the other churches it would be omitted, Tychicus supplying the name of the locality as he brought the letter to it, coming finally to Laodicea, the last city of the circuit where his copy was left. This would explain Marcion's finding of our Epistle there without "at Ephesus" in the text and also the reference in Colossians (Col. iv. 16, "When this epistle hath been read among you, cause that it be read also in the church of the Laodiceans; and that ye likewise read the epistle from Laodicea") to the letter which that church was to receive from Laodicea, which was the natural head of this Lycus-valley group. The similarity between Ephesians and Colossians referred to above is very close, as the most cursory reading will show. This extends not only to the doctrinal content, but even, in many instances, to words and phrases. Yet neither Epistle seems to have been actually a mere imitation of the other. The most satisfactory theory is that after Paul had written his special message to the church of Colossae (See COLOSSIANS, EPISTLE TO THE) he decided to send a somewhat similar, but more general and less personal, letter to the circle of churches in the Roman Province of Asia since all were in need of the same type of instruction and faced by the same disturbing problems. Tychicus, the bearer of the Colossian Epistle, was also the bearer of this circular letter.

Bibliography. The literature on Ephesians is in most cases the same as that on Colossians and will be found listed at the close of the article on that Epistle. Consult also Hort, *Prolegomena to Romans and Ephesians* (London, 1895), and Lightfoot, "Destination of Epistle to Ephesians," in *Biblical Essays* (ib., 1893).

EPHESUS (Lat., from Gk. *Ἔφεσος, Ephesos*). One of the 12 Ionic cities of Asia Minor. It was situated in Lydia, near the mouth of the river Cayster, on two hills, named Coressus and Prion, in the midst of an alluvial plain (Map: Greece, Ancient, E 3). Its origin is enveloped in myths, as is that of all the Ionic cities; but the reputed founder of the Greek city of Ephesus was Androcles, son of Codrus, the last King of Athens. The population was

by no means all Ionic, as appears from the fact that the Ephesians did not celebrate the great Ionic festival of the *Apaturia* (see GREEK FESTIVALS), nor were they divided into the four Ionic tribes. (Consult Hogarth, *Ionia and the East*, pp. 45 ff., Oxford, 1909.) The presence of the great temple of Artemis (see DIANA, TEMPLE OF) seems to have made it a sacred place from an early time, and its situation at the starting point of one of the great trade routes into the interior of Asia Minor led to its commercial prosperity. It suffered from the Cimmerian invasion, about 655 B.C., and early submitted to the Lydians under Cræsus and later to the Persians under Cyrus the Great. During the Græco-Persian wars we hear little of the city, and it played no prominent part during the Peloponnesian and later wars. After the time of Alexander the Great the prosperity of Ephesus seems to have greatly increased. The city was strengthened and improved by Lysimachus and the kings of Pergamon. The Romans made it the capital of the Province of Asia. Under the emperors it was the most prosperous trading city in western Asia Minor, though we hear of complaints that the right of asylum possessed by the temple of Artemis was abused. The Roman Governor of Asia proceeded first to Ephesus and took office there. The account of St. Paul's labors in Ephesus, lasting nearly three years, shows the prosperity of the place and the importance of the temple in promoting that prosperity, as well as the passionate devotion of the people to their great goddess (Acts xix). A vigorous Christian church was established in the city, and later the Apostle John and other prominent men of the apostolic age made their headquarters at Ephesus. The Bishop of this church was the first of the seven to whom the Apocalypse was addressed. The destruction of its great temple by the Goths in 263 A.D. gave it a blow from which it never recovered. In 431 it was the scene of the Third General Council of the Christian Church. Its general history, while it was a city of the Byzantine Empire, was unimportant, and before the days of Tamerlane it had almost completely perished. Certain cabalistic words or sayings said to have been inscribed on the base of the statue of Artemis were copied and carried about as charms. Hence to a large number of similar charms hung about the neck and repeated in a low tone to avert danger was given the name *Ephesia litteræ*, or *Ἐφεσια γράμματα*.

Before 1863 little was known of the topography of Ephesus, though the remains of the stadium, theatre, so-called gymnasium, and a few other buildings and walls could be traced. Wood's excavations in search of the temple of Artemis, made for the British Museum, assisted in clearing up some of the uncertainties in the plan. (See, further, DIANA, TEMPLE OF.) However, it was not till the Austrian Archaeological Institute began its systematic explorations that any very definite information was obtained concerning the ancient city as a whole. Work was begun in 1896 and is not yet completed; indeed, the excavations have not been carried below the Imperial level. The great harbor is now known to date from the Hellenistic period (it had been thought to be Roman). A broad street leading from the harbor past the theatre (a structure dating from Christian times, which has been fully excavated) and terminating

in a triumphal arch furnishes a starting point for the determination of the topography of the city. Other discoveries include two large market places—one Greek, the other Roman—surrounded by colonnades and rooms, a large number of inscriptions, and many statues and reliefs, among them a bronze athlete, using the strigil, of remarkable beauty. Consult: Guhl, *Ephesiaca* (Berlin, 1842); Curtius, *Ephesus* (ib., 1874); Wood, *Discoveries at Ephesus* (London, 1877). For reports of the Austrian excavation, consult: *Anzeiger der philosophisch-historischen Klasse der kaiserlich-königlichen Akademie der Wissenschaften in Wien* (Vienna, 1897 et seq.); *Jahreshefte des österreichischen archäologischen Instituts* (ib., 1898 et seq.); Benndorf, Heberdey, etc., *Forschungen in Ephesus*, vol. i (ib., 1906); "Ephesos," in Lübker, *Reallexikon des klassischen Altertums* (8th ed., Leipzig, 1914). For excavations in the temple of Diana by D. C. Hogarth, see DIANA, TEMPLE OF.

EPHESUS, COUNCILS OF. Many councils were held at Ephesus, of which two deserve special mention: 1. The Third Ecumenical Council, which opened on June 22, 431. It was called by the Emperor Theodosius II at the request of the orthodox, represented by Cyril, Patriarch of Alexandria, and of Nestorius, Patriarch of Constantinople, whom Cyril accused of heresy because he taught that the two natures in Christ are not united in one personality; hence Mary was not the "Mother of God," but of Christ, the Man with whom God was joined. Nestorius requested that action upon the disputed doctrine be deferred until the Syrian bishops, whose votes he hoped would decide the matter in his favor, should arrive. The opening of the council was delayed 16 days, but they did not come. On the very first day the matter was settled against Nestorius, and he was excommunicated and deposed. When the Syrian bishops finally arrived (June 26 or 27), they held a meeting, and protested against the action of the synod, excommunicated Cyril, and appealed to the Emperor. But Nestorianism was doomed. The council was attended by about 200 bishops and closed on July 31. (See NESTORIUS.) 2. The other famous synod was convened in August, 449, also by the Emperor Theodosius II. Under the lead of Dioscurus, Patriarch of Alexandria and successor to Cyril, it proceeded to secure the restoration of Eutyches, who taught one nature in Christ, viz., the divine, and who had been deposed therefor by the Synod of Constantinople in 448, and the confirmation of this doctrine, which was favored by the Alexandrians. The council was marked by great disorder and even violence. Soldiers were brought in, blood was shed, and Flavian of Constantinople was so maltreated that he soon died. But the Alexandrian doctrine was indorsed. The council is called the Robber Synod, and its decision was quickly reversed by the Ecumenical Council of Chalcedon (451). Consult Perry, *The Second Synod of Ephesus* (Dartford, 1881). See EUTYCHES.

EPH'IAL/TES (Lat., from Gk. Ἐφιάλης). 1. A son of Poseidon and Iphimedia. See AIO-ADÆ. 2. The Malian who showed the Persians a mountain path by which they were enabled to come up behind Leonidas and his band of Spartans at Thermopylæ and destroy them. See LEONIDAS; THERMOPYLÆ.

EPH'OD (Heb. *ephôd*, vestment). The name of one of the garments worn by the high priest

(Ex. xxviii. 6-8), but worn also by temple servants in general. Samuel wears one (1 Sam. ii. 18), and also the 85 priests of Nob (1 Sam. xxii. 18). Likewise David wears an ephod when dancing before the ark (2 Sam. vi. 14). It may be assumed that the ordinary ephod made of linen was less ornate than the one used by the high priest, which was made of costly material and of various colors—blue, purple, scarlet, and fine linen, interwoven with gold thread. It was held in place by two shoulder straps, attached to it behind and passing over the shoulders to the front. On the top of each of the shoulder pieces was an onyx stone on which the names of the 12 tribes were engraved, six on each stone. The ephod was worn over a blue frock, and on its front was the jeweled breastplate containing the oracle pouch for the Urim and Thummim. Ephod is also used in the Bible for image. Gideon is said to have made himself an ephod of the golden rings taken from the Midianites and to have set it up in Ophrah (Judg. viii. 27). It was evidently an object of worship, and since 1700 shekels were spent on it, it is natural to suppose that the ephod was the chief object in the sanctuary. Elsewhere, too, the ephod is spoken of in a manner to permit of no doubt that a part of the equipment of a sanctuary is meant. In Judg. xvii-xviii Micah provides for an ephod, and here and elsewhere the ephod is placed side by side with the teraphim (e.g., Hos. iii. 4), which were small images set up in one's household and used in divination. The ephod may therefore have been used in connection with the teraphim.

To reconcile two such divergent uses of the same term various theories have been put forward. The most probable supposition is that the ephod was originally the covering of a divine image. This vestment of gold, silver, or fine cloth embroidered with precious metals, was the most valuable part of the idol, and the name could therefore be applied to the image itself. In this garment, or shoulder cloth, there apparently was a pouch containing the oracle lots. It has been supposed that this vestment could be removed from the image and that the priest put it on when giving oracles. The name may then have been generalized and become the term for the garment worn by the priest when he came to the sanctuary to seek an oracle. Gressmann thinks that the linen ephod originally belonged to Nabu-Nebo, who since earliest times was worshiped in Syria and of whom the linen garment, the tablets of destiny on the breast, and the divination are characteristic. Consult: Foote, "The Ephod," in *Journal of Biblical Literature*, vol. xxi (1902); Sellin, *Das altisraelitische Ephod* (Giessen, 1906); Gressmann, in *Die Religion in Geschichte und Gegenwart* (Stuttgart, 1910).

EPHOR. See **EPHORI**.

EPHORI (Lat., from Gk. ἐφοροι, *ephoroi*, overseers, from ἐπί, *epi*, upon, over + ὁράω, *horan*, to look). An order of magistrates at Sparta. Herodotus attributes their creation to Lycurgus, and Aristotle to King Theopompus, while it seems clear that the Alexandrian chronologists had a list which extended back to about 757 B.C. As they appear in Spartan colonies of Thera and probably Tarentum, they must have early become an established part of the Spartan government. It is clear that they gradually took into their hands the real power, while the share of the kings in the government was

lessened, especially as a result of the jealousy between the two royal houses. (See **SPARTA**.) Their name seems to indicate that they were originally appointed to see that the discipline of the state was observed. The ephori were five in number; they were elected annually by and from all Spartans, and the decision of a majority was binding on the board. Every full citizen was eligible. During the fifth and fourth centuries B.C. the ephori are the governing body at Sparta; they convoke the Council of Elders and the Assembly, carry out decrees, receive ambassadors, determine the mobilization of the army, and during the war are kept informed of affairs in the field by secret dispatches, while two of the board always accompany the King in his campaigns. As presidents of the Council of Elders, they could bring even the kings to trial, and it is clear that their almost unlimited power during their short term caused much dissatisfaction to the more independent kings. The revolution of Cleomenes III temporarily destroyed their power, and, though after his overthrow in 221 B.C. the old forms were nominally restored, the ephori do not seem to have become again the ruling body. Even in Roman times the old name was retained by a board of five magistrates at Sparta, but we are not informed as to their duties. Consult: Dum, *Die Entstehung und Entwicklung des spartanischen Ephorats* (Innsbruck, 1878); Meyer, *Forschungen zur alten Geschichte* (Halle, 1892); Gilbert, *The Constitutional Antiquities of Sparta and Athens* (Eng. trans., London, 1895); Kuchner, *Entstehung und ursprüngliche Bedeutung des spartanischen Ephorats* (Munich, 1897); Szanto, article "Ephoroi," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. v (Stuttgart, 1905). For a list of the ephors, consult Porulla, *Prosopographie der Lakedaemonier bis auf die Zeit Alexanders des Grossen* (Breslau, 1913). Consult, finally, the Greek histories of Grote, Holm, Busolt, and E. Meyer.

EPH'ORUS (Lat., from Gk. Ἐφῶρος) (c.400-c.330 B.C.). A Greek historian, a contemporary of Philip and Alexander. He was born at Cyme in Æolis and studied rhetoric under Isocrates, who, it is said, persuaded him to devote himself to history instead of to oratory. His chief work was *Ἱστορίαι*, a history of the Greeks and the barbarians from the return of the Heraclidae (see **DORIANS**) to the siege of Perinthus by Philip of Macedon (340 B.C.), a period of 750 years. The work, which was the first universal history attempted in Greece, consisted of 30 books, each of which contained a compact portion of the history and was thus complete in itself. Though Ephorus' style was feeble and diffuse, he appears to have been a faithful narrator, and his work was highly valued on account of the wealth and excellent arrangement of its material. It was the chief source of Diodorus Siculus (q.v.) and was commended by Polybius and Strabo. The few fragments were published in Müller's *Historicorum Græcorum Fragmenta*, vol. i (Paris, 1868); this work contained also a discussion of the life and writings of Ephorus. Consult Klügmann, *De Ephoro Historicorum Græco* (Göttingen, 1860), and Bury, *The Ancient Greek Historians* (New York, 1909). Under **CRATIPPUS** will be found a reference to the fragments of a Greek historian, published in 1908, in *Oxyrhynchus Papyri*, v. Walker, *The Hellenica Oxyrhynchia: Its Authorship and*

Authenticity (Oxford, 1913), maintains that Ephorus was the author of this fragment. Walker's book gives the literature of the discussion of the fragment.

EPHRAËM, ʿfrā-ēm, or **EPHREM SYRUS**, EPHRAÏM THE SYRIAN (c.306-1378). The greatest of the Syrian church fathers, known as the Prophet of the Syrians. He was born at Nisibis, Mesopotamia, about 306. He was a pupil of Jacob, Bishop of Nisibis (died 338), became a teacher in the latter's school, and in 325 accompanied him to the Council of Nicæa. In 363 Nisibis was ceded by the Emperor Jovian to the Persians, and Ephraim took up his abode at Edessa (Orfa). He became a hermit and lived in a cave near the town. Towards the end of his life he is said to have visited Basil the Great at Cæsarea in Cappadocia, who tried to make him a bishop, but he refused any higher office than the diaconate. He died at Edessa in 373 or 378. His death is said to have been hastened by his efforts to relieve the sufferers from plague and famine then raging at his home. An extraordinary mass of fable and legend is contained in two recensions of an anonymous life of Ephraim. It is certain that he was a zealous upholder of orthodoxy and wrote and preached unceasingly against idolaters, "Chaldees," Jews, and all heretics. He was a voluminous writer and has left commentaries on nearly all the Old Testament in the Syriac or Peshitto version, as well as many homilies, and several hymns of much merit. His works exist partly in the original Syriac, partly in Greek, Latin, and Armenian translations. They were edited by the Assemani (Rome, 1732-46). There is also an edition of *Opera Selecta* by Overbeck (Oxford, 1865). Consult in English: Morris, *Select Writings of Ephraim the Syrian* (Oxford, 1847); Burgess, *The Repentance of Nineveh and Select Metrical Hymns and Homilies* (London, 1853); Harris, *Fragments of Ephraim Syrus upon the Diatessaron* (Cambridge, 1895); Hill, *A Dissertation on the Gospel Commentary of Ephraim the Syrian* (London, 1896); Seebright, *A Short History of Syriac Literature* (London, 1894). There is a prose translation of several hymns and homilies, with an introduction by John Gwynn, in *Nicene and Post-Nicene Fathers*, 2d series, vol. xiii (New York, 1898).

EPHRAÏM, ʿfrā-īm (Heb., fertile, fruitful tract). The name given, in Gen. xli. 50-52, to the younger son of Joseph by his wife Asenath. He is regarded as the eponymous ancestor of the tribe of Ephraim. The territories of the tribe in Palestine (q.v.) extended from the brook Kanah, where Manasseh began, southward, including the rich country spoken of as "Mount Ephraim" (Josh. xvi. 5 et seq.) (Map: Palestine, E 5). It is to be noted, however, that the Hebrews did not succeed in driving the Canaanites out of this district (v. 10), so that in all likelihood some mixture of Hebrews with Canaanites took place. The tribe was, perhaps, the most warlike in Israel. Joshua, the conqueror of the Holy Land, was an Ephraimite (Num. xiii. 8), and further proof of their warlike spirit appears in Ephraim's protests against Gideon (Judg. viii. 1) and Jephthah (Judg. xii. 1-7) for not asking aid of them in their wars. Shiloh, at one time the seat of the tabernacle, was in Ephraim, and the prophet Samuel belonged to the tribe (1 Sam. i. 1). Ephraim took part in the revolt of Saul's son, Ishbosheth (2 Sam. ii. 8-9), and later in the successful

revolution of Jeroboam (1 Kings xii. 1-20). After this revolt Ephraim is merged in the northern kingdom, and of this kingdom it formed by far the most important part.

The story told in Gen. xlviii. 15-19, of the preference which Jacob gave to Ephraim in blessing him before Manasseh, although the latter was the older son of Joseph, truthfully reflects this superior position which Ephraim occupied in the northern kingdom, and its general prominence in Hebrew history before the Exile. The tribal traditions furthermore indicate that at one time Manasseh, Ephraim, and Benjamin constituted a single tribe known as Joseph. Benjamin was the first to cut loose, and hence becomes, in tribal metaphor, the younger brother of Joseph. For a time Manasseh and Ephraim remained together, and even in Solomon's days they still united for administrative purposes, but at last Ephraim also cut loose and eventually outranked Manasseh.

EPHRAÏM (Gk. Ἐφραίμ, *Ephraim*). A town mentioned in John xi. 54, to which Jesus retired because of the hostility manifested by the Jewish authorities after his raising of Lazarus (Map: Palestine, C 4). The place is described as "near to the wilderness" (uncultivated pasture land) and is probably to be identified with the modern *Et-Taiyibeh*, about 4 miles northeast of Bethel, the modern *Beitin*. The Ephraim of 2 Sam. xiii. 23 and of 2 Chron. xiii. 19, the Aphairema of 1 Macc. xi. 34, and the Ephraim of Josephus, *Wars*, iv. 9, all probably represent the same place. Practically nothing is known of its history.

EPHRAÏM CO'DEX. See **BIBLE**.

EPH'RATA. A borough in Lancaster Co., Pa., 38 miles (direct) east by south of Harrisburg, on the Philadelphia and Reading Railroad (Map: Pennsylvania, J 7). It is a health resort and has manufactories of cigars, silk, underwear, and hosiery. The borough owns its water works and electric-light plant. Ephrata is noteworthy chiefly on account of having been formerly the seat of the mystic Order of the Solitary, a semimonastic order of Seventh-Day Dunkers. The community, which contained both men and women, was founded by Johann Conrad Beissel (q.v.), in 1732. The members adopted a peculiar dress, somewhat resembling that of the Capuchins or White Friars, and the men wore long beards. Celibacy was looked upon as praiseworthy, but marriage was permitted. Property was held in common, although private ownership was not forbidden. Many of the members were well educated; Peter Miller, second prior of the monastery, translated the Declaration of Independence into seven languages, at the request of Congress. A printing press was set up, and a number of works, in both English and German, some of them very beautifully made and now highly prized, were published. At the period of its greatest prosperity the community contained nearly 300 persons, but about the time of the Revolution it began to decline, and few traces now remain. Pop., 1900, 2452; 1910, 3192. Consult Gibbons, *Pennsylvania Dutch and Other Essays* (Philadelphia, 1872), and Sachse's exhaustive two-volume work, *The German Sectarians of Pennsylvania* (ib., 1899-1900).

EPHYDRA, ɛf'i-drā (Neo-Lat., from Gk. ἐφύδρος, *ephydros*, living on the water, from ἐπί, *epi*, upon + ὑδρ-, *hydr*, water). A genus of small flies, of the family Ephydriæ, whose eggs

and larvæ are eaten by American Indians. One species (*Ephydra hians*) is cultivated by the native Mexicans, as was the custom of their ancestors. Another species furnished food to the aborigines about Mans Lake, Cal. For full details, see FLX.

EPIC CYCLE. The name given to a series of poems produced by various Greek poets of the Ionian school, between c.800 and 550 B.C. These productions were later combined with the Homeric poems into an epic cycle designed to give a complete survey of mythology from the marriage of Uranus and Gæa to the death of Ulysses; their writers were hence known as cyclic poets (q.v.). Among their works were the *Cypria* of Stasinus, forming an introduction to the *Iliad*, and the *Ethiopsis* and *Iliu Persis* of Arctinus, forming its continuation. The interval between the *Iliad* and the *Odyssey* was covered by the *Nosti* of Agias of Træzen, and the *Odyssey* was supplemented by the *Telegonia* of Eugammon of Cyrene. Of these and other works only the titles, authors' names, and some fragments have come down. The poems are chiefly of importance from the fact that the dramatists drew on them for their versions of the myths. They were later arranged for educational purposes by the so-called cyclographs and illustrated by artists. A specimen of these collections, the famous Tabula Iliaca (q.v.), is in the Capitoline Museum at Rome.

EPICCHARMUS (Lat., from Gk. Ἐπίχαρμος, *Epicharmos*) (c.540–450 B.C.). The greatest of the Sicilian comic poets. He was born in Cos, but spent practically all his life in Sicily, mainly at Syracuse. Tradition says that he lived to be 90 years of age and was greatly honored by the Syracusans. Epicharmus doubtless owed much to the Syracusan tyrants, Gelon and Hiero, who generously aided lyric and dramatic poets, that they might increase the brilliancy of their courts; it was probably under their patronage that he produced his comedies, the representative plays of the Sicilian or Dorian comedy. These numbered 36 (according to some authorities 52) and roughly fall into two classes—mythological travesties and realistic scenes from common life—as the extant titles show. To the first belonged his *Busiris*, *Cyclops*, *Hephestus*, *Marriage of Hebe*, and *Prometheus*; to the second, *The Peasants*, *The Visitors at the Festival*, etc. The second class introduced new themes, among them that of the parasite, closely allied to those of the mime (q.v.), which was also first developed in Syracuse. Plato called Epicharmus master of the comic type, and Horace (*Epistles*, ii, 1, 58) preferred him to Plautus (q.v.). Ennius named after him his didactic poem on natural philosophy. While Athenian comedy was a local development, no doubt Epicharmus' influence on Attic comedians of the fifth century was not without its effect. Yet the statement that Epicharmus was the inventor of comedy (due to an epigram, No. 17, of Theocritus) can be true only in this: that Epicharmus was one of the first to give comedy developed and artistic form. He was famous for his philosophical utterances, and his comedies continued to be studied long by philosophers and grammarians; Apollodorus, of Athens, in the second century B.C., published an edition in 10 books. The extant fragments are edited by Lorenz (Berlin, 1864); Kaibel, *Comicorum Græcorum Fragmenta*, part i (Leipzig, 1899). Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (5th ed., Munich, 1908).

EPICÆNE, ἐπί-σέν (Gk. ἐπικοῖνος, *epikoinos*, of either gender, promiscuous), or **THE SILENT WOMAN**. A comedy by Jonson (1609). Morose, an old man who dislikes noise, is led to marry Epicæne, because of her reputation for silence, and in order to disinherit his fortune-hunting nephew, Dauphine. After the marriage Epicæne at once becomes a noisy shrew; and Morose, by promises of reward, secures his nephew's help in releasing himself from her. Thereupon Dauphine shows Epicæne to be a disguised boy, whom he had brought to his uncle to play him a trick.

EPIC POETRY. A species of narrative poetry, dealing with an action or series of actions and events of permanent interest and power. Its theme, however varied in its aspects and issues—and the epic manner favors multiplicity here—must be, in the last analysis, single in its nature and must be developed in the region of the ideal. Acts of trifling importance are not for this reason excluded from epic poetry, which rather, in its endeavor to give a broad survey of human life, abounds in matters of everyday occurrence. But these should form, at the most, only a background for the elevation and greatness of the rest and must, like them, be set forth in noble phrase. By the Greeks of the classical period it was, from one point of view, distinguished from lyric poetry by being recited or rather given in recitative instead of being sung, and from dramatic poetry by being simply narrated instead of acted. But there is a further difference, as they also saw. A lyric is the expression of sentiment and mood, while a drama deals primarily with the delineation of character through external action. In either case the interest is wholly personal and lies in the portrayal of the character of the individual. The course of events, which in the drama forms the plot, is the means whereby this portrayal is accomplished and gains its value from this fact, and not primarily from its own intrinsic interest. The web of the action is closely and compactly woven to show the development of character. The successive scenes have a direct and logical bearing upon the statement and solution of the problem; and thus episodes, which form an important feature of epic structure, are properly excluded from the drama. The epic poem, on the contrary, to quote the words of Dr. Butcher, "relates a great and complete action, which attaches itself to the fortunes of a people or to the destiny of mankind, and which sums up the life of a period. The story and the deeds of those who pass across its wide canvas are linked with the larger movement of which the men themselves are but a part. The particular action rests upon forces outside itself. The hero is swept into the tide of events. The hairbreadth escapes, the surprises, the marvelous incidents of epic story, only partly depend upon the spontaneous energy of the hero." In the poems universally recognized as epics the personages of the action, and the forces outside it, alluded to in the quotation above, are concretely presented through the poetical machinery of a double plot and two spheres of action with many points of contact—a human plot and a divine plot, complicated and resolved in the *Iliad* and the *Odyssey*, e.g., by the gods of mythology on the one hand and by the Greek and Trojan heroes on the other. A like double plot is found in Vergil; and in Milton God and Satan and their opposing hosts

play their parts and determine the course of the human story of man's first disobedience. In Tasso's *Jerusalem Delivered* and in the *Lusiad* of Camoëns the, so to speak, celestial and terrestrial plots again coexist. Another mark of works universally accepted as epics, as implied in the quotation from Dr. Butcher, is their tendency to be social or national as opposed to individual, to sum up and express in essence an epoch and a nation—witness the great Greek and Roman epics—or an epoch and a great company of people with a solidarity of faith, thought, and sentiment, as in the case of Dante's *Divina Commedia*, which is the voice of mediæval Catholicism, or of Spenser's *Faerie Queene* and Milton's *Paradise Lost*, which are the expressions respectively of the Renaissance in England and of the sterner Puritanism of a later day. The great types of character of the primitive epic are national rather than individual, and in the contemplation of them the nation recognizes with exultant pride its glorious achievements and ideals. Among the Greeks, e.g., this was the secret of the power exercised by the *Iliad* and the *Odyssey*, and for the French by the *Chanson de Roland*. Again, in the *Æneid*, in which the divine purpose that Rome should wield the empire of the world is carried out through human instruments, the Roman people itself is the real hero, as indeed Vergil's contemporaries must have seen when they called the poem *Gesta Populi Romani*.

Epic poems fall naturally into two divisions:

(1) those which, like the *Iliad*, the *Chanson de Roland*, and the *Mahābhārata*, are the outcome of a period of spontaneous composition of epic songs; (2) those which, like the *Æneid*, the *Gerusalemme liberata*, and *Paradise Lost*, are the creation of highly cultivated and widely read minds, consciously using a long-established form and accepted models. The artistic excellence of the Homeric poems, which stand at the beginning of historical Greek literature, necessarily presupposes an extended period of poetic production, during which the material, partly mythological, partly historical, of these long poems formed the subject of numerous shorter folk songs. In the *Iliad*, e.g., Achilles, to please his friend Patroclus, sings in his hut before Troy of the *ἄλκα ἀνδρῶν*; and, in the *Odyssey*, the blind minstrel Demodocus, at the court of Alcinoüs, sings to the assembled company at the hero's request a particular lay about the making of the wooden horse by means of which Troy was taken—a lay which, as the context clearly implies, belonged to a longer tale about Troy. Such epic, or epic-lyric, songs must have abounded and must have shown infinite variation of incident and expression; for they were the products of a youthful and buoyant age, in which fancy, not the passion for scientific accuracy, was supreme. This is, in fact, characteristic of popular poetry everywhere. It is markedly impersonal and national. All its elements—structure, metre, phrase, style—are common property, and every complete poem is equally a part of the general stock. It is never simply repeated, but at each recitation undergoes fresh changes. In Italy, in Serbia, or in Russia a song of 8 or 10 lines will show endless variations, and in Finland, where the entire traditional poetry has one unvarying form, we find a perfect type of popular poetry. Each song, says Comparetti, "not only differs between singer and singer, but even the same

singer never repeats it twice in exactly the same manner, often going so far as to bind together and give as one those songs which but recently he recited as separate and distinct." This last fact is especially noteworthy as bearing upon the way in which the epic song ultimately grew into the epos. In the Icelandic *Poetic Edda* the lays which preserve different parts of the earlier and grander form of the Völsung-Nibelung story show great diversity of treatment of a common legend. The material of these and other lays, not now extant, was worked up into the prose *Völsunga-Saga*, the action of which, as of the lays, moves wholly in the sphere of the magical and supernatural and shows no trace of Christian influence. But when towards the end of the twelfth century this story, common to all the Teutonic stock, finally takes place in south Germany as an epic poem, not only is the tale itself different at times in detail and incident, but the entire atmosphere and setting is changed. History has taken the place of myth. Brunhild is no longer a Valkyr, nor is Siegfried able to change his shape. Belief and manners are Catholic and mediæval instead of heathen and primitive. Early French epic poetry shows, perhaps, even more clearly the continuous change and growth of popular song. The *Chansons de Geste*, as the name implies, deal with historical facts; but it is history transformed and glorified by passion and imagination. If one examines the *Chansons* (whether, like the *Roland*, the *Pèlerinage de Charlemagne*, the *Roi Louis*, they belong to the royal period, or, like *Renaud de Montauban* and *Girard de Roussillon*, to the feudal), one discovers at once the same conditions that appear among the Teutons and the Finns—a mass of fluctuating poetic thought in a perpetual state of composition, decomposition, and recomposition. This poetry developed among the warrior class and those attached to its service, and there is no doubt that the songs contemporary with the events were often composed and chanted by the knights themselves. But they were especially composed and made familiar to all by the minstrels, the *jongleurs* (q.v.). In the endeavor to please by giving a touch of novelty to a favorite old poem, they would combine two or three songs, modify them to remove discrepancies, and amplify for the sake of poetical embellishment or more stirring description of incident. In this way there came into existence an immense body of epic material contained in short songs, which towards the middle of the eleventh century began to take the form of long epic poems. Finally, the composition of the *Chansons de Geste* comes to an end in a period (from the end of the twelfth century to the middle of the fourteenth) which is analogous to that of the cyclic poets in Greece. The greatest of these epics, the *Chanson de Roland*, must be dated, in its earliest extant form, full three centuries after the defeat at Roncevaux (c.778), upon which historical event it is based; and it weaves into its story dim memories of the personages and events of later periods. Over 100 years later a redaction in rhyme instead of assonance appears, with a new ending of some 2000 lines; and of this version we have again a large number of *remaniements*, or rehandlings. Moving and fine as is the poetry of the *Roland*, it still lacks something of the breadth and variety of the great narrative poems which may be said to constitute the norm of this literary genre.

The conclusions as to the genesis of epic poetry to which we are thus far led are strengthened by a study of the Sanskrit *Mahābhārata*. There was a like warrior class, the Kshatriyas, proud of its valorous deeds and delighting in their celebration in song; and there is no reason to doubt that, in India as in Greece, Iceland, Germany, and France, popular poetry flourished in the form of short epic lays.

That the poems which are sometimes called the epics of growth were formed out of earlier *kleine Lieder* is now universally accepted. What is still a warmly disputed point is the mode in which the combination was finally effected. Was the epos a mere compilation of these shorter lays, more or less ingeniously fitted together, with the help, perhaps, of some new connecting links, but still with such preservation of the original masses that the modern scholar with his critical acumen can discern the junctures? Or, was the entire material so fused in the mind of some one great poet as to come forth a homogeneous and organically related whole? In 1795 F. A. Wolf published his famous *Prolegomena to Homer*, in which he argued at length for the view that "Pisistratus was the first who had the Homeric poems committed to writing and brought into that order in which we now read them." Karl Lachmann, in two papers read to the Berlin Academy in 1837 and 1841, maintained that the *Iliad* was made of 16 independent lays, with various enlargements and interpolations, all finally reduced to order by Pisistratus. Since that time the Homeric question has been much discussed, and widely divergent theories, differing both in principle and in detail, have been put forth by scholars who deny the unity of the *Iliad* and the *Odyssey*. Mr. Walter Leaf, e.g., in his *Companion to the Iliad* (1892), holds that, to an original *Wrath of Achilles* (about 3400 lines in length), there were added in different ages extensive expansions and interpolations, as well as short passages by which the transitions from one piece to another of different age were managed; and he presents a tentative scheme of the lines belonging to each of the five strata that he postulates. In regard to the *Nibelungenlied*, M. Lichtenberger, a sane critic, believes that some nameless redactor put together the ancient lays after they had been adapted to the manners of an age of chivalry; and M. Gaston Paris is inclined to call the poet of the *Chanson de Roland* an *arrangeur* rather than an *auteur*.

An important contribution to the subject of epic poetry in general, as well as to the character of a particular epic poem was Signore Compagetti's study of the Finnish *Kalevala*. Out of the entire body of the traditional poems of the Finns, by a process of selection and arrangement and by the insertion of short transitional matter, Dr. Lönnrot constructed a perfect epos; though the popular singers, the *laulajat*, not only knew no such poem, but were unable to imagine one. In the edition of 1849 there are 50 cantos and 22,800 lines. Here, if anywhere, we have the genesis of an epic in accordance with the Wolfian and Lachmannian theory. Lönnrot, it is true, did not merely stitch together such definitely shaped songs as those into which Lachmann resolved the *Nibelungenlied* and the *Iliad*. At times he divided the runes, recombined their parts, and chose out of the innumerable variants those best fitted for his purpose. But in doing this without adding anything essential of his own, he adopted a procedure, not of the poet,

but of the scholar—the heir of the ages, familiar with the Homeric question and with the theory of the epos. Compagetti argues at length that, to suppose a Greek of the time of Pisistratus, a *jongleur*, or even the Indian Vyāsa, capable of working in this way, is to commit a mere anachronism; that the *Kalevala* has in no sense that unity which is apparent in the *Iliad* and the *Odyssey*, in the *Chanson de Roland*, and even in the *Nibelungenlied*; and, finally, that "a long poem, created by the people, does not exist, cannot exist; epic popular songs, such as could be put together into a true poem, have never been seen, and are not likely to be seen among any people. Every long poem, without exception, anonymous or not, is the work of an individual—is a work of art."

Epic poetry has not been produced by all races nor by all nations. Thus, among the Servians, Russians, and Siberian Tatars, we find epic or epic-lyric songs; but they are never welded together into an epos. The same is true of the Celts, who, in both the branches of the race, the Gadhelic and the Cymric, developed an abundance of epic material, especially in the two great cycles of tradition, the Fingalian or Ossianic and the Arthurian. The Anglo-Saxon *Beowulf* is finely epic in substance, but has scarcely the range and complexity of a great epos. Spain, too, had her truly heroic figure—the Cid, the Roland of his country. But the ballads and the poem that sing his praises were never worked up into a great national epic.

It remains to consider briefly the epics of the second class. Like those of the first, these may deal with the traditions, mythical or historical, of the nation; but they are in every way the creation of an individual mind, from which they receive their atmosphere and color. They stand, therefore, in sharp contrast with the wholly impersonal work of Homer, e.g., in Greece, and the poets of the *Nibelungenlied* and *Gudrun* in Germany, and of the *Mahābhārata* and *Rāmāyana* in India—poems which are the natural outcome of a *fermentation épique*, as M. Gaston Paris calls it, and of which it may be truly said that the song dominates the singer rather than the singer the song. Epics of this personal character belong to no special period in the history of a people, and their number is still increasing. It must suffice to mention a few of these. In India the renaissance of literary activity in the fifth and sixth centuries A.D. produced those epics which, as being the work of a single poet (*Kavi*), are called *Mahākāvya*, or great poems—a name already applied to their model, the *Rāmāyana*, as being composed by Vālmiki. In Greece, in the centuries immediately following the composition of the *Iliad* and the *Odyssey*, the so-called cyclic poets further developed and unified the Trojan cycle of legends. In the Alexandrian period the *Argonautica* of Apollonius Rhodius may be noted; and in our own era, between the fourth and sixth centuries, Nonnus and Musæus have some claim to distinction. At Rome national epic poetry was early cultivated by Nævius and Ennius and comes to its most perfect form in the Augustan age, in the *Æneid* of Vergil, undoubtedly one of the great epics of the world. Later we find the *Pharsalia* of Lucan, the *Punica* of Silius Italicus, the *Thebais* and *Achilleis* of Statius. In Persia, Firdausi, drawing upon good historical sources, composed the *Shah-Namah*, or 'Book of Kings'—a complete history of Persia, which was at once hailed with enthusiasm as the

national epic. Among the great epics of modern times must certainly be reckoned the *Lusiad* of Camoëns, the *Orlando Furioso* of Ariosto, and the *Gerusalemme liberata* of Tasso, the *Faerie Queene* of Spenser, the *Paradise Lost* of Milton, and the *Messias* of Klopstock.

The epic has been written also in burlesque form, as e.g., in the *Batrachomyomachia*, or 'Battle of the Frogs and Mice.' The animal epic should also be mentioned, best represented by *Reineke Fuchs*.

EPICURETUS (Gk. Ἐπικύρητος, *Epikētos*, The Acquired: a nickname) (c.50-?). A celebrated Stoic philosopher, born at Hierapolis in Phrygia. He was at first the slave of Epaphroditus, a freedman of Nero, at Rome. He was afterward manumitted and devoted himself to the Stoic philosophy. Domitian hated him on account of his principles and banished him, along with several other philosophers, from Rome (90 A.D.). Epictetus settled at Nicopolis in Epirus, near Actium. Under the pressure of the times in which he lived his serious moral views received a character rather of self-denial than of energy. His pupil, Arrian, collected the maxims of Epictetus in the work entitled *Encheiridion* (Handbook) and in eight books of commentaries, four of which are lost. (See ARRIANUS.) The peculiar excellence of the writings of Epictetus is simple and noble earnestness. The real heartfelt love of good and hatred of evil, which are often thought to be exclusively Christian feelings, manifest themselves very finely and beautifully in the philosophy of Epictetus, yet there is no evidence that he knew anything of Christianity. There are several good editions of the works of Epictetus, the most complete of which is that of Schenkl (Leipzig, 1898). Consult translations by Mrs. Elizabeth Carter (London, 1758), Higginson (2 vols., Boston, 1890), and Long (London, 1848, 1877, 1892, 1897). Consult: Melcher, *De Sermone Epictetico* (Halle, 1906); Arnold, *Roman Stoicism* (Cambridge, 1911); Ritter and Preller, *Historia Philosophæ Græcæ* (9th ed., Gotha, 1913).

EPICUREANISM. The name applied, often very loosely, to the system of philosophy based more or less on the teachings of Epicurus (q.v.). The philosopher himself, although the majority of his writings referred to natural philosophy, was not, properly speaking, a physicist. He studied nature with a moral rather than with a scientific design. According to him, the great evil that afflicted men—the incubus on human happiness—was fear: fear of the gods and fear of death. To get rid of these two fears was the ultimate aim of all his speculations on nature.

He regarded the universe as corporeal, as infinite in extent, and as eternal in duration. He recognized two kinds of existence—that of bodies, and that of vacuum or space. Of his bodies, some are compounds, and some are atoms or indivisible elements, out of which the compounds are formed. The world as we now see it is produced by the collision and whirling together of these atoms, which possess only the attributes of shape, size, and weight. Of these atoms there is an infinite number, varying in size and shape, but of equal specific gravity. These atoms naturally fall downward in the empty space, but the direction they take is not absolutely uniform. Hence come clashes between them, and combinations which result in the universe as we know it. But beyond our known world Epicurus held that there are innumerable others. He also held the doctrine of perception by images (Gk. εἰδωλα, *eidōla*), which are incessantly streaming off from the surface of all bodies, and which are necessary to bring man into relation with the

world without. In like manner he believed that sounding bodies threw off emanations by which human beings were brought into sympathy with them, and that perception by smell took place in the same way. In psychology Epicurus was a decided materialist, holding, for various reasons, that the soul is a bodily substance, composed of subtle particles, disseminated through the whole frame, and having a great resemblance to spirit or breath with a mixture of heat. It is interesting to note that Epicurus, following Empedocles (q.v.), anticipated the modern doctrine of natural selection in maintaining that natural causes gave rise to various differences in organic forms, but only those able to support themselves and to propagate their species have survived. Epicurus did not deny that there are gods, but he strenuously maintained that, as "happy and imperishable beings," they could have nothing to do with the affairs of the universe or of men. This Epicurean theology is admirably expressed in the closing lines of Tennyson's *The Lotus Eaters*.

Epicurus next proceeds to deal with the fear of death. Having proved in his psychology that the dissolution of the body involves that of the soul, he argues that the most terrible of all evils, death, is nothing to us, since *when we are, death is not; and when death is, we are not*. It is nothing, then, to the dead or the living; for to the one class it is not near, and the other class are no longer in existence. The insight shown by this remark has not been sufficiently appreciated.

The ethical side of Epicurus' system may be noticed in a few words. He held that *pleasure* was the chief good, and it is from a misapprehension of the meaning of this word as used by Epicurus that the term "Epicurean" came to signify one who indulged his sensual appetites without stint or measure. At the same time it is easy to see that the use of the word "pleasure" was prone to produce the mischievous results with which the later Epicureanism was charged. The whole question of ethics, then, comes to a calculation and balancing of pleasure and pains; in other words, the cardinal virtue is *prudence*. Epicurus rests *justice* on the same prudential basis as temperance. Denying any abstract and eternal right and wrong, he affirms that injustice is an evil because it exposes the individual to disquietude from other men; justice is a virtue because it secures him from this disquietude. The duties of friendship and good-fellowship are inculcated on the same grounds of security to the individual. Epicurus is distinguished from his contemporaries by the fact that he taught the doctrine of the freedom of the will.

Among the Romans the system of Epicurus was adopted by many prominent men. Horace, Atticus, and Pliny the Younger were Epicureans; and the splendid poem of Lucretius is the finest literary expression that Epicureanism has achieved. In modern times Epicureanism was resuscitated in France by Pierre Gassendi, who published an account of Epicurus' life and a defense of his character in 1647. Many eminent Frenchmen have professed his principles; among others, Molière, Saint-Evremond, the Comte de Gramont, the Duc de la Rochefoucauld, Rousseau, Fontenelle, and Voltaire. Consult: Lange, *History of Materialism* (Eng. trans., Boston, 1886); Asener, *Epicurea* (Leipzig, 1887); Watson, *Hedonistic Theories* (Glasgow, 1895); Wallace, *Epicureanism* (London, 1880);

See EPICURUS; HEDONISM.

EPICURUS (Lat., from Gk. Ἐπίκουρος, *Epikouros*) (c.342-270 B.C.). An illustrious Greek philosopher. He was born probably in the island of Samos, in December, 342, or January, 341, B.C., six or seven years after the death of Plato. His father, Neocles, is said to have been a schoolmaster, and his mother, Chærestrate, to have practiced arts of magic. In his boyhood he heard Pamphilus and Nausiphanes lecture on philosophy, but did not claim to be a pupil of either. At the age of 18 Epicurus repaired to Athens to present himself before the members of his demos and to be duly confirmed as an Athenian citizen. His stay at Athens on this occasion was not long; when he rejoined his father's family, however, it was not at Samos, but at Colophon, whither Neocles had repaired upon being dispossessed of his home at Samos. In his thirtieth year Epicurus was settled at Mitylene, and there he first won recognition as a philosopher; at Lampsacus two or three years later he became the head of a school. But Athens was the place where philosophers could expect to get their best hearing, and thither Epicurus returned about 306 B.C. Here he bought a garden which he used as the seat of his school. From this circumstance his followers were called the "philosophers of the garden." Although women as well as men frequented the garden, and although among these women were many of the *hetære* (q.v.), the life of the brotherhood was not marked by sexual excesses, popular scandal to the contrary notwithstanding. The calumnies which the Stoics circulated concerning the school are undeserving of notice. The success of Epicurus as a teacher was signal; great numbers flocked to his school from all parts of Greece and from Asia Minor, most of whom became warmly attached to their master as well as to his doctrines, for Epicurus seems to have been characterized not less by amiability and benevolence than by force of intellect. He died 270 B.C., in the seventy-second year of his age.

Epicurus was a most voluminous writer. According to Diogenes Laërtius he left 300 volumes. Among others he had written 37 books on natural philosophy, a treatise on atoms and the void, one on love, one on choices and avoidances, another on the chief good, four essays on lives, one on sight, one on touch, another on images, another on justice and the other virtues, etc. From all these works there have come down to us three letters and a number of detached sentences or sayings, preserved by Diogenes Laërtius in his life of the philosopher.

Outside of these the principal sources of our knowledge of the doctrines of Epicurus are Cicero, Seneca, Plutarch, and, above all, Lucretius, whose great poem, *De Reum Natura*, contains substantially the Epicurean philosophy. To these must be added a large number of papyri found at Herculaneum about the middle of the eighteenth century. These contain fragments from Epicurus and many writings of Epicureans, especially of Philodemus. But unfortunately the manuscripts are in a deplorable condition. See EPICUREANISM.

EPICYC'LE (Lat. *epicyclus*, Gk. *ἐπικυκλος*, *epikykylos*, epicycle, from *ἐπὶ*, *epi*, upon + *κύκλος*, *kuklos*, circle). The earlier astronomers assumed that all the motions of heavenly bodies take place in circles, and that all the heavenly bodies move round the earth, which remains at rest in the centre. The observed phenomena of the heavens, however, were soon seen to stand in glaring inconsistency with these assumptions. For the sun and moon, which manifestly do not always move with the same velocity, the eccentric circle (q.v.) was imagined. The case of the planets, whose motions were seen to be sometimes direct, sometimes retrograde, and sometimes altogether arrested, offered still greater difficulties; to get over which, the idea of *epicycles* was hit upon. According to this hypothesis, while a planet was moving in a small circle, the centre of that small circle was itself describing a larger circle about the earth. This larger circle was called the *deferent* (q.v.), and the smaller, which was borne upon it, was called the *epicycle*. In this way the motions of the planets about the earth were conceived to be something like what the motion of the moon about the sun actually is. By assuming proper proportions between the radii of the deferent circle and the epicycle, and between the velocities of the two motions, it was found possible to account for the motions of the planets.

EPICYCLOID (Gk. *ἐπι*, *epi*, upon + *κύκλος*, *kuklos*, circle + *εἶδος*, *eidos*, form). If a circle moves on the circumference of the circumference of another circle, every point in the circumference of the first circle describes an epicycloid. This curve first appeared in a work of Dürer's (1525), but the name is due to Roemer (1672). It has many remarkable properties and is also interesting from a practical point of view. The teeth of cogwheels must, as shown by Desargues, have an epicycloidal form, in order that friction may be minimum. The term formerly included the curve described when the moving circle was on the inside of the other, but this "inner epicycloid" is now called the "hypocycloid." For the equation of this curve and references to its history, see CYCLOID; and for a more extensive bibliography, consult the *Intermédiaire des Mathématiciens* (Paris, 1898, 1899).

EPIDAMNUS. See DURAZZO.

EPIDAU'RUS (Lat., from Gk. *Ἐπίδαυρος*, *Epidauros*). A maritime town of ancient Greece, on the Saronic Gulf, in the northeast part of Argolis, situated on a small promontory, in lat. 37° 38' N., long. 23° 10' E. (Map: Greece, Ancient, C 3). The early history of Epidauros is involved in myth, but numerous religious connections with Attica lend probability to the legend of an original Ionian population. Later, it was a Dorian city, closely connected with Argos, though not subject to that city. The greatest prosperity of Epidauros seems to have been in the early period, when it was a mem-

ber of the Calaurian Amphictyony and ranked as a naval power; at that time it controlled, it is said, Ægina and colonized Cos, Calydnus, and Nisyrus. Its power afterward declined, and during the historical period it owed its importance chiefly to the proximity of the celebrated sanctuary of Æsculapius, which attracted patients from all parts of the Greek world. The site of this temple was a plain surrounded by mountains, about 8 miles west of the town, still called Hieron (the sanctuary). Epidauros (modern Greek, *Epidauro*) is now a small village, with scarcely 100 inhabitants, employed for the most part in raising vegetables for the Athenian market. The plain surrounding the village is productive and highly cultivated. Here, in January, 1822, a congress from all parts of Greece assembled, and promulgated the constitution, known as the Constitution of Epidauros. The site of the sacred precinct was excavated, from 1881 on, by the Greek Archaeological Society, under the direction of M. Kavvadias. Conspicuous among the ruins is the Tholos, a circular structure of large diameter, which excited the warm admiration of the ancients. The theatre of Epidauros is one of the best preserved and the most beautiful of ancient theatres. In the sacred precinct were found two colonnades, a temple of Æsculapius, baths, gymnasium, and a hospital. Numerous inscriptions, too, were found, of great value with respect to the cult of Æsculapius. Consult: Gardner, *New Chapters in Greek History* (London, 1892); Diehl, *Excursions in Greece* (ib., 1893). The detailed descriptions may be found in the *Πρακτικά* of the Greek Archaeological Society, particularly for 1881-84 and 1889; *Ἐφημερίς Ἀρχαιολογική* (1883, 1885); Kavvadias, *Les fouilles d'Epidaure* (Athens, 1893); Defrasse and Léchat, *Epidaure* (Paris, 1895), magnificently illustrated with conjectural restorations of the principal buildings; Kavvadias, *Τὸ ἱερὸν τοῦ Ἀσκληπιοῦ ἐν Ἐπίδαυρῳ καὶ ἡ Θεράπεια τῶν ἀσθενῶν* (Athens, 1900). For a plan, consult Baedeker, *Handbook to Greece* (4th Eng. ed., Leipzig, 1909).

EPIDEMIC (Lat. *epidēmos*, Gk. *ἐπίδημος*, among the people, from *ἐπὶ*, *epi*, upon + *δῆμος*, *dēmos*, people). A name applied to diseases which appear at intervals and spread over a certain area, or traverse a large section of the world and attack a large number of people. An epidemic disease may become endemic (q.v.) and remain permanently in a locality. Cholera is epidemic in certain parts of Europe, at intervals subsiding and disappearing, while it remains endemic in India. Probably all diseases which are epidemic in various parts of the world are endemic in certain localities, and the epidemics are brought by travelers from these localities, or follow commerce under favoring conditions, such as debility dependent upon exposure to miasms after inundations, swarming and migration of insects which carry contagion, e.g., mosquitoes carrying germs of yellow fever or of malaria. Drainage and paving of streets result in checking and eradicating an epidemic of malaria in a town. Opening the pavements and tunneling the streets afford harbors in damp spots and puddles for mosquitoes, which propagate rapidly, become infected with the plasmodium of malaria, and transmit the microorganism to human beings; and thus an epidemic of malaria is started. Epidemics of typhoid fever are almost invariably traced to one or a few

cases of the disease, from whose excrement drinking water has become polluted. Epidemics are due, primarily, to dissemination of bacterial germs, though in some diseases of the contagious class (such as scarlet fever and smallpox) the causative germs have not yet been isolated. They must be checked, therefore, by bacteriological precautions. It is difficult to explain the cause of certain cycles in which epidemics appear to move, regularly recurring in certain localities; but in all cases precautions should be taken to quarantine people entering a port from an infected country, and clothing and all merchandise should be disinfected. Serum therapy (q.v.) promises a protection against many epidemic diseases, notably typhoid fever, as well as treatment during disease.

Epidemics of nervous diseases have appeared at times in the history of the world: as of chorea (q.v.) or of dancing mania. Under the leadership of a person afflicted with paranoia (q.v.), many people of unstable mental equilibrium have been dominated by suggestion (q.v.), and the results have been crusades, persecution of "witches," epidemics of suicides, etc. Consult Hecker, *Epidemics of the Middle Ages*, trans. by Babington (London, 1849), and Creighton, *The History of Epidemics in Great Britain* (2 vols., Cambridge, 1891-94). See CLIMATE; CONTAGION; INFECTION; CHOLERA; TYPHOID FEVER; INFLUENZA.

EPIDEMIC CEREBROSPINAL MENINGITIS. See MENINGITIS.

EPIDENDRUM (Neo-Lat., from Gk. *ἐπι*, *epi*, upon + *δένδρον*, *dendron*, tree). A genus of strong-growing, long-stemmed epiphytal orchids, of which nearly 600 species have been found in Central America alone. Though some of the species produce showy blossoms, the majority have flowers of rather unattractive appearance, various shades of greenish purple being common. The group is of special interest, however, from its increasing popularity in hybridizing with the gaudier, weaker, short-stemmed, and more difficultly cultivated members of other genera, e.g., *Cattleya* and *Laelia*. The operation is of fairly easy performance and often results in vigorous plants, long stems, graceful racemes, and attractive flowers.

EPIDERMIS (Lat. from Gk. *ἐπιδερμς*, upper skin, from *ἐπι*, *epi*, upon + *δέρμα*, *derma*, skin). The cuticle, or scarf skin, a semitransparent membrane, containing neither vessels nor nerves, and everywhere forming an external covering to the derma, or true skin. It consists of two distinct layers, viz., the *mucous layer*, which lies immediately upon the corium, and the *horny layer*, which forms the outermost surface of the body. The mucous layer (the *rete mucosum*, or *rete Malpighi*) is of a whitish or slightly brown tint (in the negro dark gray or black), and is composed of rounded or cuboidal cells, distended with fluid, and likewise containing minute granules, which diminish in number in the more external cells. The horny layer forms the external semitransparent part of the epidermis, which in the white races is colorless, and is composed almost wholly of uniform cells agglutinated and flattened. The color of the epidermis differs in different persons and in different parts of the body. It is deepest around the nipple, especially in women during pregnancy and after they have borne children. A more or less dark pigment is often deposited in persons who are exposed to the sun, in the face, neck, back of

the hands, etc. These tints are not produced by special pigment cells, but are seated in the common cells of the mucous layer, round whose nuclei granular pigment is deposited. In the negro and the other colored races it is also only the epidermis which is colored. Morbid coloration of the epidermis (freckles, moles, etc.) is produced in the same way as the color of the negro's skin. Numerous instances of partially or entirely white negroes and of black Europeans, not as a consequence of change of climate, but as an abnormal condition of the skin, are on record.

The thickness of the epidermis varies extremely. While upon the cheeks, brow, and eyelids it varies from $\frac{1}{8}$ to $\frac{3}{8}$ of a line (a line being $\frac{1}{16}$ of an inch), on the palm of the hand it ranges from $\frac{1}{3}$ to $\frac{1}{2}$ a line, and on the sole of the foot sometimes even exceeds a line. In some parts of the body the horny layer is thicker than the mucous; in others the mucous is the thicker of the two. As the chief use of the epidermis is that of affording protection to the soft and tender subjacent part, it attains its greatest thickness on those portions of the body (the palm of the hand and the sole of the foot) which are most exposed to pressure and friction. The hair and nails belong to the integumentary system, as well as horns in lower animals, and are modifications of epidermis. See INTEGUMENT.

EPIDERMIS. A special superficial layer covering the whole body in higher plants. Among the lowest plants there is no distinct epidermis, a fact related to their simple structure and also to the conditions in which they grow. The epidermis becomes established, as a definite layer of a special character and with special functions, in land plants exposed to the air. Such a layer is a very efficient protection against the excessive loss of water. See BARK; CORTEX; MORPHOLOGY OF PLANTS.

EPIDIDYMITIS. Inflammation of the epididymis, a complexly convoluted tube lying upon the posterior surface of the testicle, and conveying the seminal fluid from it to the *vas deferens*, the proper ejaculatory duct. Epididymitis in the acute form arises commonly from gonorrhœa or, more rarely, from injury. The chronic forms are tubercular or syphilitic. Sterility in the male is a frequent consequence of gonorrhœal epididymitis. The acute form of the affection is very painful and lasts from one to three weeks, with symptoms of swelling, pain, and exquisite tenderness. Treatment consists of rest in bed, support for the affected part, application of soothing lotions, such as lead and opium wash, or ointments containing ichthyol, or poultices. Internally saline purgatives, sedatives for the pain, and specific remedies addressed to the particular form of the disease under treatment are indicated.

EPIDOTE (from Gk. *ἐπι*, *epi*, upon + *δοτός*, *dotos*, given, from *δίδωμι*, *didonai*, to give). A name given to a group of basic orthosilicate minerals that include zoisite, epidote, piedmontite, and allanite. The mineral epidote proper is an aluminium-iron-calcium silicate that crystallizes in the monoclinic system, has a vitreous lustre, and is commonly some shade of pistachio green in color, sometimes shading to brown or nearly black. It is also found massive, fibrous, and granular, and is common in crystalline rocks. Its distribution is world wide, but fine crystals, which may be cut as gems, occur in Norway, Siberia, the Tirol, and in the United States in Haddam, Conn., Chester Co., Pa., at

various places in North Carolina, in the Lake Superior region, and in Pike's Peak region, Colo.

EPIGÆA. See **ARBUTUS**, **TRAILING**.

EPIGASTRIUM (Neo-Lat., from Gk. ἐπιγαστήριον, *epigastrios*, over the stomach, from ἐπὶ, *epi*, upon + γαστήρ, *gastēr*, stomach). The part of the abdomen (q.v.) which chiefly corresponds to the situation of the stomach, extending from the sternum towards the navel, or umbilicus (q.v.). It is called, in popular language, "the pit of the stomach." See **ABDOMEN**.

EPIGEAN (ἐπιγῆαν) **GERMINATION.** The type of germination in which the cotyledons remain below the surface of the soil.

EPIGENESIS (Neo-Lat., from Gk. ἐπὶ, *epi*, upon + γένεσις, *genesis*, production, from γίγνεσθαι, *gignesthai*, to be produced). A special or technical name for the modern conception of the growth and development of the animal organism from the undifferentiated mass of protoplasm constituting the egg. The word is the equivalent of the word "evolution" and is opposed to the preformation views of writers before the time of Harvey, Wolff, and Von Baer, and to somewhat similar views advocated at the present day by Weismann. The older writers, as Bonnet and Haller, used the word "evolution" in the sense that we now employ the term "preformation," or the *emboîtement* theory. See **PREFORMATION**.

The doctrine of phenomenon of epigenesis is the result of the scientific study of the embryology of animals of all grades from the sponge to man. Before the rise of modern embryology the ablest, most sagacious biologists and philosophers were evolutionists, i.e., preformationists. They knew or recognized only the external signs of the process of development. They witnessed the embryo becoming an adult animal, as a bud develops into a blossom. They knew nothing of the nature of the egg cell, how it became fertilized, subdivided, and how by the multiplication of cells tissues were formed and the different organs of the embryo became developed. They saw the butterfly emerge from the chrysalis, the latter from the caterpillar, and they conceived that the preformed germ of the butterfly and chrysalis and caterpillar existed, in miniature, in the egg laid by the butterfly. Hence they believed that animals in general were a series of cases or wrappings, germ folded within germ, and that the process of birth was a throwing off of these wrappings—a process of evolution.

This ignorance was partially dispelled by Harvey (1651), who maintained that every living being arose from an egg (*Omne vivum ex ovo*). But the founder of embryology was Kaspar F. Wolff, who published his famous *Theoria Generationis* in 1750. He was the first to study the embryology of a vertebrate animal—the barnyard fowl. By means of actual observation of the embryo chick he endeavored to expose the fallacy of the doctrine of preformation, to show that the animal was not fully formed in the germ, but that all development proceeded by new formation, or "epigenesis." He maintained that the embryo consisted of unorganized organic matter, which only gradually became perfected in the course of its development, and that Nature really was able to produce an organism from an undifferentiated material, simply by her inherent forces. Wolff failed to convince his contemporaries, because he could bring only isolated observations and these doubtful of interpretation, and because

he was ahead of his time, naturalists then attaching more importance to abstract reasoning than to observation.

The next embryologist to lend, by his observations, support to the views of Wolff was Von Baer in 1829, and after his time the cell theory was formulated, and the epoch-making works of the later embryologists, J. Müller, Rathke, Kölliker, Remak, Bischoff, E. Van Beneden, Kovalevsky, the Hertwig brothers, Weismann (in his earlier works), and many others, gradually built up the modern science of embryology (q.v.) and entirely dispelled the old-time preformation views.

Bibliography. O. Hertwig, *The Biological Problem of To-Day: Preformation or Epigenesis?* (Eng. trans., New York, 1894). Also the works of Haeckel, Nügli, Strasburger, H. de Vries, His, Roux, Driesch, H. Spencer, Whitman, Wilson, and other authorities under **EMBRYOLOGY**.

EPIGLOTTIS. See **LARYNX**.

EPIGONI (Lat., from Gk. ἐπιγονος, *epigonos*, descendant, from ἐπὶ, *epi*, upon, after + γόνος, *gonos*, offspring, from γίγνεσθαι, *gignesthai*, to become). In Greek legend, a name applied to the descendants of the seven chiefs who attacked Thebes in the war between Eteocles (q.v.) and Polynices. After the disastrous defeat of this expedition and death of all the leaders except Adrastus, a second war was undertaken by the children of the fallen chiefs, and this is known as the "war of the Epigoni." It seems that the story was told in two forms in the early epic, for two lists of names are preserved, agreeing only in six out of eight or nine heroes. The result is said to have been the capture and destruction of Thebes, the death or flight of King Laodamas, son of Eteocles, and the establishment of Thersander, son of Polynices, on the throne. In literary history the term "epigoni" is sometimes applied to scholars who limit themselves to unfolding the ideas of the great masters of a previous age. See **SEVEN AGAINST THEBES**.

EPIGRAM (Lat. *epigramma*, Gk. ἐπιγράμμα, *epigramma*, inscription, from ἐπὶ, *epi*, upon + γράμμα, *gramma*, writing, from γράφειν, *graphein*, to write). The epigrams of the early Greeks were simply inscriptions on tombs, statues, and monuments, written in verse, and marked by brevity and simplicity of style, but having nothing in common with what now passes under the name. It was among the Romans that the epigram first assumed a satirical character. The great masters were Catullus and Martial. In modern times an epigram is understood to be either a very short poem, generally from two to eight lines, containing a witty or ingenious thought expressed in pointed phraseology, and in general reserving the essence of the wit until the close; or a pithy and pointed saying expressed in prose. Epigrams flourished in the period following the revival of learning. John Heywood wrote 600, and almost every Elizabethan versifier tried his hand at them. Later, Pope became the great master. Among the French Clément Marot was one of the first to write epigrams. He was afterward excelled by Boileau, Voltaire, and Piron. Epigrams in German are for the most part happily expressed moral proverbs, but the *Xenien* of Schiller and Goethe contain not a few sharp and biting verses of a satirical character. In English the art of epigram, after having been practiced by Byron and Moore, fell into disuse, until revived by William Watson in his *Epigrams of Art, Life, and Nature* (Liverpool, 1884). Consult: Booth,

Epigrams, Ancient and Modern (2d ed., London, 1865); Dodd, *Epigrammatists of Medieval and Modern Times* (2d ed., ib., 1875); Adams, *Book of Epigrams* (ib., 1890).

EPIGRAPHY. See INSCRIPTIONS.

EPIGYNY, ἐπιγυνή (from Gk. ἐπί, *epi*, upon + γυνή, *gynē*, woman). In flowers, a condition in which the sepals, petals, and stamens seem to arise from the summit of the ovary. In epigynous flowers the ovary appears just below the "flower," and is often said to be "inferior." Contrasting terms are hypogyny (q.v.) and perigyny. See FLOWER.

EPILEPSY (Lat. *epilepsia*, Gk. ἐπιληψία, *epilēpsia*, epilepsy, from ἐπιλαμβάνειν, *epilambanein*, to seize upon, from ἐπί, *epi*, upon + λαμβάνειν, *lambanein*, to seize). A form of disorder, known also as *morbus sacer*, *morbus comitialis*, "great disease," *grand mal*, and, more commonly, "the falling sickness." It is characterized by sudden insensibility, generally with convulsive movements of the voluntary muscles, and occasionally arrest of the breathing, owing to spasm of the muscles of respiration and temporary closure of the glottis. (See LARYNX.) Owing to the striking character of the convulsion of epilepsy it was, in ancient times, supposed to be due to the influence of the gods or of evil spirits and was therefore called by the Romans "sacred disease." There are four varieties of this condition: (1) *grand mal*; (2) *petit mal*; (3) *psychic epilepsy*; (4) *Jacksonian epilepsy*.

In the ordinary form, or *grand mal*, the patient is seized with insensibility, often so complete and sudden as to lead to serious bodily injuries; in the most aggravated cases he has no premonitory sensations whatever, but falls down without any attempt to save himself, and usually with a wild inarticulate cry, immediately after which the face is violently distorted, the head drawn towards one or other shoulder, and the whole body convulsed. These convulsions follow in rapid succession for a few minutes, and are attended by foaming at the mouth and by great lividity, or, in some cases, pallor, which, with the regular spasmodic movements of the lips, nostrils, and eyes, almost invariably lead the bystanders to an exaggerated idea of the immediate danger of the fit. The immediate danger is, in reality, not great, excepting that the sudden attack may lead to an injurious or fatal fall; the tongue, however, may be bitten, or the patient may be so placed as to injure himself seriously by the repeated and unconscious movements of his body, or he may suffocate himself by accidentally falling with his face in water, or otherwise closing up the mouth and nostrils, or by dragging upon a tightened neckcloth. Care should always be taken to avoid these accidents by keeping the epileptic as much as possible within view of persons acquainted with his condition and able to give such assistance as may be required, and the patient himself should avoid places in which a fall would be dangerous. Any attempt to rouse the patient by violent stimuli, or by administering medicines hastily recommended, is almost certain to do more harm than good. The patient should, if possible, be placed on a mattress or other soft place near the ground; his clothing loosened round the chest, the head a little raised, and a free circulation of air maintained. The ordinary course of the fit (which may last from 5 to 20 minutes altogether) is as follows: the convulsions

gradually diminish in intensity, and the patient passes into a state of deep but motionless stupor, with dilated pupils, and sometimes, but not always, with snoring or noisy breathing; the foaming at the mouth ceases, the color gradually returns, and this state leads to recovery through a more or less protracted but apparently natural sleep, the patient, on awakening, feeling fatigued or tender in the muscles which have been convulsed. The sensations which precede the fit—the *aura epileptica*—resemble a current of cold air passing over the body and proceed from the extremities towards the head. In some cases the aura consists of noise in the ears, or a black cloud appearing above the head, or a feeling of nausea or faintness, or loss of breath. In some, the premonitory symptoms allow of time enough for the patient to lie or sit down and thus avoid falling. In most cases a peculiar inspiratory noise or a moan or scream is emitted, called the epileptic cry, as the fit begins. Not infrequently there is no aura or unusual sensation of any kind, preceding the fit. A tight bandage placed suddenly upon the limb in which the aura begins may cut short the fit, or even prevent it altogether.

In *petit mal* the loss of consciousness lasts two or three seconds, and the patient does not fall, but simply suspends operations, stares fixedly before him, gasps, and resumes consciousness, generally without knowing that he has experienced the attack. No treatment is necessary during the attack.

In *psychic epilepsy* there are the usual premonitory conditions noticed. After a period of despondency, irritability, restlessness, dread, giddiness, or, in some patients, intense elation, in others an exhibition of voracious appetite, instead of a fit the patient experiences a sudden attack of laughing, weeping, or shouting, with extravagant gesture and maniacal appearance, and even in some examples with uncontrollable homicidal impulse devoid of motive. This is the "psychic equivalent."

In *Jacksonian epilepsy* there is no loss of consciousness; the spasmodic movements are confined to a limited area or to one extremity. It is generally due to tumor of, or pressure upon, the brain in the motor area which controls the part convulsed; it may be due to abscess of the brain, injury, or meningitis.

The ultimate danger of the disease has little relation to the severity of the individual fits, except in the modified sense explained above; the frequency of the attacks being apparently much more apt than their character to influence the duration of life. Indeed, although epileptics may survive several severe paroxysms at distant intervals and recover in the end completely, it rarely happens that very frequently repeated attacks, especially of the *petit mal*, are unattended by some permanent depreciation of the powers of mind or body. The most frequent of the more serious consequences is insanity (q.v.). Sometimes the development of epileptic insanity is attended by palsy, and other indications of structural disorder of the brain; in other instances no such consequences occur, and the brain after death may be found to have very little tangible disease, or only such disease as is found in numerous other cases of functional derangement. Very often there is loss of memory. Yet history furnishes several examples of epileptics who were men of unusual mental ability and intellectuality, as, e.g., Julius Cæsar,

Petrarch, Peter the Great, Mohammed, and Napoleon. Disorders of the digestion are also not uncommon, and there is frequently a want of tone or vigor in all the bodily functions, which communicates an habitual expression of languor and reserve to the epileptic.

In some case of *grand mal* the patient has a succession of fits, one after another, without regaining consciousness for several hours. This is termed *status epilepticus*, and is a grave condition, as the patient may die in it. After an attack of *grand* or *petit mal* a patient may experience a condition of reduced consciousness, during which he wanders off for a day or a week, entering shops, talking with people, eating in restaurants, and otherwise acting as if conscious; on awakening he forgets entirely all that has happened. Or there may be a postparoxysmal psychic manifestation in which the patient is excited and homicidal.

Masked epilepsy, or *epilepsia larvata*, is the term given to a condition succeeding a minor attack of epilepsy, in which there are random remarks made and automatic acts performed by the stupid and dazed patient. Gowers states that imperfect loss of consciousness with automatic action constitutes the minor seizures in some cases, without any initial epileptic stage. He considers epilepsy as a disease of the gray matter of the brain, most frequently of the cortex, which results in an impairment of the resistance of the nerve cells to the liberation of energy. A sudden and violent liberation of nerve force results in derangement of function and impairment of consciousness. Certain cases undoubtedly depend upon organic disease, as tumors or injuries to the brain and its membranes, more especially near the surface. Local sources of irritation in other parts of the body have acted as reflex exciting causes of epilepsy, and cases are recorded in which the disease has been cured by the amputation of a finger or the division of a nerve. The treatment of epilepsy should consist of alleviation of conditions and depends upon the variety of the disease. Iron, zinc, nitrate of silver, borax, digitalis, antipyrine, the bromides, and many other drugs have been used. Bromides control the fits, while they are used, in almost all cases, but are not curative, and their effect is deteriorating and deplorable. Attention to the digestive tract and prevention of fermentation therein, out-of-door life, proper food, and baths have resulted in recovery in many cases. Recovery may be looked for in 8 or 10 per cent of cases. Any treatment must be prolonged at least two years. Marriages of epileptics should be absolutely forbidden. It is estimated that epilepsy claims 1 in 500 of the population in the United States. No race is free from it. Fully 75 per cent of cases begin before the sixteenth year.

Medico-Legal Importance of Epilepsy. Attacks of psychic epilepsy are of vast medico-legal importance. Epilepsy is common among the criminal class, and the lower type of epileptic is cunning, deceitful, treacherous, and bold. Bevan Lewis calls attention to the fact that leading ideals, delusional or otherwise, prevailing in the preparoxysmal stage, are likely to become operative in conditions of postepileptic automatism and during psychic equivalents. It is a hard task to decide whether an epileptic is accountable and should be punished for crimes committed during a psychical manifestation, equivalent or postepileptic. The epileptic will perform auto-

matically complex acts that have the very appearance of deliberate volition. The discovery of motive in an interparoxysmal complaint or threat is not proof of the responsibility of the patient for crime committed during the attack.

A just disposal will be made of these criminals and of the malingers for whom their legal advocates enter a plea of transient insanity due to epilepsy, when they are promptly confined in a hospital under the eye of a competent alienist, that their interparoxysmal mental state may be studied, and the preparoxysmal and postparoxysmal stages of subsequent attacks may be observed. Study of the intervallic period will generally prove barren of result; rarely will it afford evidence of a mind governed by delusions. Study of the conditions immediately antecedent and subsequent to the attacks will give evidence as to the presence of genuine automatism, of uncontrollable impulse, or of blind fury operating during reductions in consciousness.

Epilepsy in the Lower Animals. Some of the lower animals are subject to epileptic fits. The disease is common in dogs, cats, and highly bred pigs. The creatures writhe with involuntary spasms and are for the time without sight or hearing. Sometimes the muscles of the throat are so involved that fatal suffocation occurs. The attack is generally preceded by dullness and lasts from 10 to 30 minutes. It is generally traceable to torpidity or irregularity of the bowels, worms, debility, or plethora. In dogs it is a frequent sequel to distemper. In cattle it usually occurs in connection with the engorgement of the first or third stomach; they throw themselves violently about, bellowing loudly, but seldom die. It is rare in horses. The treatment consists in freely opening the bowels, removing worms if any are present, with bleeding and spare diet if the patient's condition is high, and generous feeding and tonics where it is low. The best preventives are carefully regulated diet, an occasional laxative, with a course of tonics, and especially of arsenic. Good results may be obtained in the treatment of cattle by giving four drams of bromide of potash three times daily.

Consult: Gowers, *Diseases of the Nervous System* (London, 1904) and *The Borderland of Epilepsy* (ib., 1907); Spratling, *Epilepsy and its Treatment* (Philadelphia, 1904); Turner, *A Study of the Idiopathic Disease* (London, 1907).

EPILEPTIC COLONY. An establishment that differs from an asylum or a hospital for epileptic patients, in that it consists not of one building or a group of buildings in which the patients are kept for treatment, but of a large farm, in which groups of epileptics live in cottages or in many segregated buildings, and spend their time in gardens, out of doors, or in workshops, schoolhouses, gymnasias, amusement buildings, and chapels, hospitals, and libraries. The greatest improvement in previously hopeless cases and the largest proportion of cures are secured in the colony system, with little drugging and with natural and hygienic conditions of life. The first epileptic colony, that of Bethel, at Bielefeld, in the Prussian Province of Westphalia, was established with four patients. The celebrated pastor, Friederich von Bodelschwingh, first took charge of it in 1872. It has been marvelously successful. With its officers, physicians, nurses, and employees, and over 1600 epileptics, the colony contains over 3800 persons.

The patients are about equally divided in num-

ber between the sexes. About 8 per cent are cured; about 21 per cent are discharged improved; about 21 per cent leave unimproved; about 20 per cent die. About 61 per cent of the cured are under 18 years of age. Only 47 out of over 5000 patients have been turned over to insane asylums.

Several other colonies have been established in Germany; there is one in Zurich, Switzerland; one in Holland; and one was established at La Force, near Lyons, France, by John Bost, a clergyman. At Chalfont St. Peter, England, a farm of 135 acres was purchased in 1893 by the National Society for the Employment of Epileptics, and the first building was opened for patients in August, 1894. There are six houses, with accommodations for 66 men, 24 women, 24 girls, and 24 boys. England's second colony for epileptics was established at Warford, near Alderley, Cheshire, in 1900, upon an estate of 400 acres. Detached buildings capable of holding 24 inmates have been erected.

The Craig Colony of New York, at Sonycia, the most extensive in the United States, was opened Feb. 1, 1896, starting with 1900 acres of well-cultivated fields, orchards, and market gardens, with about 30 buildings already thereon: residences, barns, and shops, the latter used in broom making, canning fruits and vegetables, etc. On the grounds are building-stone quarries, brick-clay deposits, and many acres of standing timber. A saw mill and a flour mill stand on a stream, which divides the tract of land into halves. The property formerly was the site of a settlement of thrifty Shakers. It is the largest in use for this purpose in the world, and is ideal in situation and facilities. An athletic field has been built where the patients engage in bicycling, tennis, baseball, and track sports. There is a military company of boys and young men, with a band of about 20 pieces. Instruction is given in reading, writing, letter composition, language, arithmetic, drawing, kindergarten work, clay modeling, and basket weaving. There is also a class in manual training. A training school for nurses was started in May, 1912. The census, Sept. 30, 1912, was as follows: 745 males, 673 females, total 1418. During the previous fiscal year 130 males and 97 females were admitted; 146 males and 83 females were discharged, transferred, or died; 4 recovered. Only chronic cases are taken. The per capita cost of maintenance has decreased with the increase of population. With an average daily attendance of 1433 in 1911-12, the annual per capita cost was \$212.92. The total cost of maintenance was \$305,261.17, which was reduced by home production of canned goods, hay, grain, fodder, vegetables, and other products to \$272,615.35, and the net per capita cost was \$175.79.

The New Jersey State Village for Epileptics, founded 1898 at Skillman, has an area of 779 acres. The Massachusetts Hospital for Epileptics, a colony, was opened in 1898 at Monson (P. O. Palmer) and comprises 658 acres, of which 203 are tilled. It sheltered 900 patients in 1912. A private corporation, known as the Pennsylvania Epileptic Hospital and Colony Farm, established in 1898 a colony of 30 patients at Oakbourne, on a farm of 110 acres. There is also a colony for the feeble minded and epileptic at Spring City, with a population of 600 (males). Texas established a colony for epileptics near Abilene in 1904.

Several other States have established farm colonies for epileptics. Michigan has a Home for feeble minded and epileptics at Lapeer sheltering 306 persons. The Indiana Village for Epileptics is situated at Newcastle, and has a capacity of 116. The Virginia State Epileptic Colony houses 100 patients, all males.

EPILOBIMUM (Neo-Lat., from Gk. *ἐπι*, *epi*, upon + *λόβος*, *lobos*, lobe, pod). A genus of plants of the family Onagraceae. The species are herbaceous perennials, natives of temperate and cold countries, and very widely diffused in both the Northern and the Southern Hemispheres. The fireweed (*Epilobium angustifolium*) is frequently planted in gardens and shrubberies on account of its numerous and beautiful rose-colored flowers. It is called fireweed, from its very early and common occurrence in tracts that have been recently burned over. It is found in very northern regions. The pith, when dried, yields a quantity of sugar to boiling water, and is used in Kamchatka for making a kind of ale. *Epilobium hirsutum*, a European species frequently cultivated as an ornamental, has escaped and become established in many parts of the United States. It has showy magenta-colored petals and is very attractive.

EPITLOGUE (Lat. *epilogus*, Gk. *ἐπιλογος*, conclusion, from *ἐπιδέειν*, *epilegein*, to say in addition, from *ἐπι*, *epi*, upon + *λέγειν*, *legein*, to say). In oratory, the summing up or conclusion of a discourse; in a drama, the short speech in prose or verse which frequently, in former times, was subjoined to plays, especially to comedies.

EPIMENIDES, ἐπι-μηνιδῆς (Lat., from Gk. *Ἐπιμενίδης*). A Greek priest of Crete, said to have come to Athens about 600 B.C., and to have purified the city from the guilt contracted by putting to death the adherents of Cylon (q.v.). The personality of Epimenides early became hidden under a mass of legend, as in the case of other prophets of new religious revelations in the seventh and sixth centuries B.C., when the Orphic movement (see ORPHICS) was at its height, and to him was attached the common folk tale of a prolonged sleep. To him are attributed the lines cited by St. Paul (Titus i. 12): "The Cretans are always liars, evil beasts, idle gluttons." He is also said to have written a poem on the voyage of the Argonauts, to have composed numerous oracles, and to have written prose works on purificatory rites. Consult: Schultess, *De Epimenide Cretensi* (Göttingen, 1877); Loescheke, *Die Enneakrannon-Episode bei Pausanias* (Dorpat, 1883); Toepfer, *Attische Genealogie* (Berlin, 1889); Kern, *De Orphici, Epimenidis, Pherecydis Theogoniis* (ib., 1888); Diels, *Epimenides von Kreta* (Sitzungsberichte der Berliner Akademie, 1891); Rohde, *Psyche* (Freiburg, 1890-94); Demoulin, *Epiménide de Crète* (Brussels, 1901); Diels, *Die Fragmente der Vorsokratiker*, 2d ed. (2 vols., Berlin, 1906-10).

EPIMETHEUS (Lat., from Gk. *Ἐπιμηθεύς*, afterthought). The son of Iapetus and Clymene, brother of Prometheus and husband of Pandora, by whom he was father of Pyrrha, the wife of Deucalion. See PROMETHEUS.

ÉPINAL, a'pé-nal'. The capital of the Department of Vosges, France, situated at the western base of the Vosges Mountains, 1070 feet above sea level, on both banks of the Moselle, 264 miles by rail east-southeast of Paris (Map: Northern France, M 4). It is a well-built, handsome town, with clean and regular streets,

ing, according to Josephus (*Wars*, II, viii, 13), a different order within the society who married—innumerable washings, scrupulous bodily cleanliness, the avoidance of contact with lower orders in the brotherhood, the exclusive wearing of white raiment, and particularly the peculiar ceremonial requirements of their common meal, to which none but full members of the order were admitted, the food of which was specially prepared by their priests, and the whole conduct of which partook of the nature of a sacrificial feast. As communists, all possessions and all rewards of labor were held in common and distributed according to need. The chief employment of the brotherhood was agriculture, though handicrafts of all kinds were carried on—the only prohibition being trading, as leading to covetousness, and the manufacture of weapons and instruments which might injure men, as being against their fundamental principle of peace, though some members of the order were found among the leaders and the fanatic followers in the Jewish War. As a society they were the first in history to condemn slavery, in practice as well as in theory, as violating the brotherhood of man.

The order had its chief roots in Judaism, its struggle after ceremonial purity showing it to be a refinement of Pharisaism. At the same time it had elements so strongly at variance with Judaism in general, and Pharisaism in particular, as to suggest influences foreign to Palestine. These elements were especially the rejection of animal sacrifices, by which its members were excluded from the temple worship; the peculiar attention to the sun, which was considered as representing the divine brightness, the members praying towards it at its rising and avoiding all uncovering of themselves before it; and especially the view entertained regarding the origin, present state, and future destiny of the soul, which was held to be pre-existent, being entrapped in the body as in a prison and having before it, as a reward of righteousness, a blessed paradise in the farthest west, and, as a penalty of iniquity, a dark and gloomy cavern full of unending punishments. As to what these foreign influences were, there is considerable discussion, in which perhaps no conclusions can be reached beyond the general one that they were Oriental, rather than Greek, gathering around an essential dualism whose influence can be traced in other peculiarities of the order's belief and custom. This is confirmed by the fact that Oriental influences were prevalent in the West from the third century B.C. to the third century A.D., within which time Essenism flourished.

It is an interesting question as to how much Christianity owed to Essenism. It would seem that there was room for definite contact between John the Baptist and this brotherhood. His time of preparation was spent in the wilderness near the Dead Sea; his preaching of righteousness towards God, and justice towards one's fellowmen, was in agreement with the propaganda of Essenism; while his insistence on baptism was in accord with the Essenic emphasis on lustrations. But the Baptist was much more of an ascetic than an Essene would have needed to be, and had a Messianic outlook, which does not seem to have entered into the Essenic belief. Doubtless the fundamental teachings of Essenism—love to God, to virtue, and to fellowmen—which also existed in Judaism outside Essenic

circles, had vital agreement with the precepts of Christianity; so that from this element in Judaism in general Christianity may have taken many of its earlier converts, while it is more than probable that Christianity's world-wide development of these common ideals did as much as anything to prepare Essenism for its final disappearance as a distinctive organization.

Bibliography. A large literature has been produced on this subject. Among the later books, consult: Lightfoot, "Excursus," in *Commentary on Colossians and Philemon* (3d ed., London, 1879); Schürer, *Geschichte des Jüdischen Volkes zur Zeit Jesu* (3d ed., 3 vols., Leipzig, 1898–1901); Friedländer, *Die Religiösen Bewegungen Innerhalb des Judenthums im Zeitalter Jesu* (Berlin, 1905); Bousset, *Religion des Judenthums* (2te Aufl., Berlin, 1906); Pfeiderer, *Primitive Christianity* (Eng. trans., New York, 1906); Fairweather, *The Background of the Gospels* (ib., 1908). Also the article by Moffatt, in *Encycl. of Religion and Ethics* (New York, 1912), which quotes at length the original sources. See JEWISH SECTS and its bibliography.

ESSENTIAL OIL. See OILS.

ESSENTUKI, or ESSENTUKSKAYA. A watering resort in the Territory of Terek, in the Northern Caucasus, Russia, about 10 miles northwest of Pyatigorsk (Map: Russia, F 6). It is situated at an altitude of about 2000 feet and is much frequented during the summer months because of its cold alkaline springs. Pop. (est.), 8000.

ESSEQUIBO, ɛs'se-kē'bō (native name *Dissequebe*). The largest river of British Guiana, rising about 1° north of the equator on the north slope of the Akarai Mountains, which separate its valley from that of the Amazon River (Map: Guiana, F 3). It flows in a northerly direction, emptying into the Atlantic west of Georgetown, after a course of over 600 miles. At its mouth, an estuary about 20 miles wide is formed, containing numerous islets. Its course is very tortuous and interrupted by numerous cataracts, while its mouth is closed by bars which can be passed by deep-draft vessels only during high tide. It is navigated for a considerable distance, and even heavy vessels can ascend for a distance of about 40 miles from its mouth. Its chief tributaries are the Rupununi, Potaro, and the Cuyuni-Mazaruni, all from the west. On the banks are forests of locust tree, ironwood, ebony, greenheart, and other fine timber trees. The region adjoining the river was the subject of conflicting claims between the British and Venezuelan governments, which led to the Arbitration Treaty of Feb. 2, 1897. The award was made Oct. 3, 1899. See VENEZUELA, *History*.

ESS'ES, COLLAR OF. A collar composed of a series of the letter S. See SS, COLLAR OF.

ESSEX (AS. *East-Soaxe*, East Saxons). A maritime county in southeastern England, bounded on the north by Cambridge and Suffolk, on the east by the North Sea, on the west by the County of London and Hertford, and divided from Kent on the south by the Thames estuary (Map: England, G 5). It has 85 miles of coast line, and an area of 1530.5 square miles. On the coast the surface is low-lying and marshy, but from the centre to the north is undulating and well wooded. The chief rivers are the Lea, Roding, Roach, Blackwater, and Colne. Chalk, brick, clay, and sea salt are the chief mineral

in the construction of fences. At best, sod fences are makeshifts.

Hedges. In England and other European countries hedges are employed in place of fences to a much greater extent than in the United States. The objections to them are that they are slow of growth, expensive to keep in order, that they "draw" the adjacent land, harbor weeds, insects, etc., and throw a considerable amount of land out of cultivation. There are many cases, however, in which the hedge proves both useful and ornamental. The favorite hedge plant in England is the hawthorn. In the Middle and Southern United States the orange orange is probably most commonly used. The arbor vitae and the boxwood (for evergreen hedges) and the privet are also frequently used. When used as fences, hedges are frequently planted on embankments of ditches or double ditches.

The Picket Fence. This form of fence is used especially for inclosing yards and gardens. It may be constructed of cheap split pickets, or of the very ornamental and expensive kind, the variety of styles being almost infinite. The picket fence forms an especially effective barrier for small animals. It may be constructed entirely of wood, of wire and wood, or of iron.

Wire Fences. Post and wire fences are probably more extensively used than are any other kind, especially in regions where timber is scarce. The single wire does not resist changes of temperature and is not as strong as the twisted wire. Firmly twisted steel wire, with barbs at short intervals, is the kind most widely used. The barb-wire fence takes up little space, is not destroyed by fire, is easily repaired, and is readily adapted to inequalities of surface. It may also be so constructed as to form an effective barrier to stock and trespassers of all kinds. The principal objection urged against it is its liability to injure stock. For this reason it is better suited to large areas than to small inclosures in which animals are likely to be more or less crowded. Various means have been proposed for overcoming this danger, but with only partial success. Two-strand twisted wire, with two-pointed and four-pointed barbs, are used, as well as flat and twisted, barbed and unbarbed, flat steel straps. The barbs should be just long enough to repel infringing animals without inflicting serious injury. Various implements have been devised which greatly facilitate the construction of wire fences. It is generally considered that two strands of barb wire, 22 inches apart, the lower 22 inches from the ground, will turn horses, cattle, and young stock, and one strand is sometimes used as a temporary barrier for the larger stock. A fence of three strands, 12, 23, and 42 inches from the ground, is more effective than a two-strand fence. Four-strand fences, with the strands 5, 12, 22, and 48 inches from the ground, are commonly used, with or without a baseboard close to the ground. Five strands, it is claimed, will turn dogs, pigs, poultry, and other small animals. With embankments, fewer strands are required for an effective fence. It is common to use posts 8 feet apart, as in board fences, but fewer posts are frequently made to serve. The corner posts should be securely braced, in order that the wires may be tightly stretched.

Flood Fences. Across streams subject to floods, or sloughs too wide for floodgates (see below), fences are often a necessity. These are usually constructed in panels, on logs, which

are linked together and fastened to posts on the banks with iron couplings, so that the fence rises and falls with the flood.

Hurdles, or Portable Fences. These are often useful. They may be constructed of wood or of wire, in a variety of ways, depending upon the purpose for which they are to be used.

Gates have generally replaced the more primitive bars, being more sightly and convenient. When properly made of well-seasoned lumber or of metal, they are very durable. The styles of construction are almost infinite. Gates for roadways should be at least 14 feet wide and should be well braced so that they will not sag. The styles of hinges and especially of fastenings are almost as numerous as the kinds of gates. (See also GATEWAY.) When fences cross streams or gulleys subject to flood, it is necessary to employ floodgates, which are panels of fence suspended on hinges so that they yield to the force of the flood and resume their position when it subsides.

Posts. The best timber for posts is probably supplied by red cedar, yellow locust, black walnut, white oak, and chestnut. Timber for posts should be cut when the sap is dormant, e.g., in midwinter or in August. The bark should be removed before setting the posts. Various means of preserving posts have been proposed. Soaking the part to be placed in the ground in kerosene and afterward coating with coal tar has been found effective. Soaking in blue vitriol (1 pound of vitriol to 40 of water) and in hot creosote and charring have also been recommended. The creosote treatment has been found most practical by the United States Forest Service. In recent years, as a result of scarcity or high cost of suitable timber for the purpose, concrete posts for wire fences have come into considerable use.

In general it may be said that fences should be built only when absolutely necessary, and then substantially constructed of good material, since a good fence will prove more economical in the end than a poor one.

FENCE, FENCING (IN LAW). At common law, a landowner is under no duty to maintain a fence, either to mark his boundary line or to protect his premises from trespass by man or beast. On the other hand, every one is under a common-law duty to keep his cattle from trespassing upon the land of others. Accordingly the introduction of fences, in agricultural regions at least, appears to have been for the purpose of keeping cattle in rather than of shutting them out. They were resorted to as a convenience rather than a protection.

While the common law does not confer upon a landowner the right to force his neighbor to maintain a fence, it does permit him to acquire such a right by grant or prescription. When the right is so obtained, it is called an easement, and the land, whose owner is thus bound to maintain a fence, is said to be subject to a servitude. A contract under seal by a property owner with his neighbor to build and maintain a fence upon the land of the former for the protection of the neighbor's premises, not only creates a personal liability enforceable against the promisor, but it may, if so intended, create an incumbrance upon his land in the nature of an easement. A prescriptive liability of this character is not common, nor is it easily established. One who claims it must be prepared to show not only that the person charged has uniformly repaired the fence in question, but

(After Schimper.)

on their outward privileges. Discipline became very lax, and the temper was Erastian. The distinctive ecclesiastical and theological notes of Anglicanism were not emphasized. The Colonial churches of Virginia, Maryland, and South Carolina came up to the General Conventions of 1785 and 1789 with a somewhat languid zeal and a disposition to minimize rather than enlarge and strengthen the essential and special features of episcopal government.

In New England and the Middle States the tone and temper were different. There was not even a quasi-establishment of the English church in either. In Massachusetts it had come in as it were at the point of the bayonet. Andros, the first royal Governor of the Colony, brought it with him into a community which both disliked and dreaded it—disliked what was considered its lax discipline and dreaded the ecclesiastical tyranny from which the colonists had suffered in the mother country and from which they had escaped in coming to America. In the midst of a community thus minded, the English church assumed a rigid attitude, both defensive of its rights and somewhat denunciatory in its criticism of its despisers. The churchmanship of its adherents was high and dry, and their political creed was Toryism. Very generally Northern churchmen took the side of the English government in the Revolution, in contrast with the attitude of the Southern churchmen, which was largely patriotic.

In Connecticut the English church was not introduced from without, but came into existence by a spontaneous movement from within. In 1722 the Rev. Timothy Cutler, rector of Yale College, and Mr. Daniel Brown, his assistant instructor, together with two noted Congregational clergymen, Rev. Samuel Johnson and Rev. James Wetmore, left the Congregational ministry, went abroad, and were ordained in London. The conspicuous position of these men drew universal attention to their act, which gave rise to a spontaneous movement in the Colony towards the Episcopal regimen. The church thus produced was very strong in its attachment to its doctrinal and practical system. Not so much, as in Massachusetts, from hatred of dissenters, but rather out of deep love for their own system and sincere conviction of its obligation, Connecticut churchmen became the most conservative of all the elements which entered into the national body. In the remaining portion of New England, as at Portsmouth and Claremont in New Hampshire, at Portland and Gardiner in Maine, and at Narragansett, Newport, Bristol, and Providence in Rhode Island, there were a few churches, but, owing to the ravages of the war, there were in all New England outside of Connecticut only six Episcopal ministers at the close of the Revolution. The few remaining effective parishes were not of a rigorous type and were generally characterized by a sense of the propriety of worship in the use of the liturgy rather than by a hearty zeal for the principles and purposes of an episcopal government.

In the Middle States there were other differences. The English church was introduced into New York, New Jersey, Pennsylvania, and Delaware about the same time, but in different ways. In New York it found a footing in 1664, when the English wrested New Amsterdam from the Dutch, but it was not until 1693, under an

Act of Assembly procured by Governor Fletcher, that it began to grow and became a quasi-establishment. Its temper was kindly towards the Dutch church, which it supplanted as the ruling ecclesiastical influence, but it was staunch in its advocacy of Episcopal principles. In New Jersey the first traces of the church are found in 1700. But it was in 1702 that two agents of the London Society for the Propagation of the Gospel in Foreign Parts, Keith and Talbot, visited the Colony, where as yet no Episcopal church existed. They were very earnest and energetic, and the corner stone of St. Mary's Church at Burlington was laid in 1703. The church from this time was widely disseminated through the province and maintained a character of steadfast adherence to the traditions of the Church of England. In Pennsylvania the English church was not introduced by foreign officials, as in New York, nor by foreign missionaries as in New Jersey, but arose from a demand of the inhabitants themselves, holding an analogous position to that of Connecticut in relation to Massachusetts and Rhode Island. The charter granted to William Penn, sole proprietor of Pennsylvania and Delaware, stipulated that "on the petitions of 20 persons, a preacher or preachers might be sent out for their instruction and should be permitted to reside in the Province without any denials or molestation whatever." According to this proviso the first church building, the precursor of Christ Church, was erected in Philadelphia in 1685, and George Keith, a seceder from the Quakers, became the first traveling missionary of the S. P. G. in 1702. But before Keith's coming, in the latter part of 1701, the society, in answer to a lawful petition of sufficient citizens, according to the charter, had sent the first settled missionary, Rev. Evan Evans, a strenuous man who, before Keith's arrival, had baptized over 500 adults and children of Quaker families, thus making evident a legitimate demand for the Episcopal church.

The movement to constitute one Episcopal church for the whole United States began on May 11, 1784, at New Brunswick, N. J. Clergymen from New York, New Jersey, and Pennsylvania had gathered there by appointment in the interests of the Corporation for the Relief of the Widows and Orphans of the Clergy. But their minds were charged with larger interests than the resuscitation of this benevolent corporation. They began at once to discuss the principles of a national ecclesiastical union. A committee of correspondence was appointed "for the purpose of forming a continental representation of the Episcopal church and for the better management of the concerns of said church." It was resolved also to call a meeting, as generally representative as possible of the clergy and laity of the different States, in the city of New York, on October 6 of the same year.

Eight States were represented at this meeting, but some of the delegates had not been regularly appointed, and those who were had only received authority to propose and deliberate. The convention, however, signed a declaration of "Fundamental Principles of an Ecclesiastical Constitution," and appointed September 27 of the following year (1785) as the date of a general convention to discuss their proposals, which advocated "one general Episcopal church for the United States, to be constitutionally governed by representatives, cleri-

cal and lay, from the church in each State." It was further resolved "That this church embody the doctrine and adopt the liturgy of the English church, so far as consistent with the changed political condition," and "That bishops be recognized as ex officio members of the General Convention, and that the concurrence of clergy and laity be essential for the validity of all measures."

This was a bold anticipation of a future which was uncertain at the time of its formulation. The clergy of Connecticut had elected the Rev. Samuel Seabury as their first Bishop, and he had already made an attempt to secure consecration from the Church of England, which had failed through political obstacles which stood in the way of free action on the part of an established church. In the event, after waiting 16 months, he proceeded to Scotland and there (on Nov. 14, 1784) was finally consecrated by three bishops of the Scottish Episcopal church, who were not hampered by any connection with the state. Thus was ended the anomalous condition which had so hampered the Colonial churches, by obliging their candidates for ordination to take the long and perilous sea voyage in order to receive the episcopal laying on of hands.

The first authorized General Convention was held in Christ Church, Philadelphia, Sept. 27, 1785. After it had been called, the churches in the separate States had met in convention, organized their dioceses, and appointed their delegates. Bishop Seabury was invited to attend, but his dissent from several of the fundamental principles kept him away, and with him all the delegates from New England absented themselves. However, of the 13 States, seven (including all the Middle and Southern States, except Georgia) were represented by 16 clergymen and 24 laymen. The fundamental principles formulated in 1784 were adopted with some slight modifications. In accordance with them, the "General Ecclesiastical Constitution of the Protestant Episcopal Church in America" was completed, which was to be presented to the churches in the various dioceses and ratified by the General Convention in 1789. It contained the general provisions already expressed and was firm in its maintenance of lay representation in the legislature of the church. The committee which drafted the constitution was empowered to make necessary liturgical alterations in the Prayer Book and to prepare a plan for obtaining the consecration of more bishops. The Convention then adjourned, to await the reply of the English bishops, and to meet again in Philadelphia, June 20, 1786. The answer of the English bishops, which arrived in May, indicated that they would gladly comply with the request to consecrate bishops for America, could they be assured of the doctrinal and disciplinary soundness of the constitution and liturgy of the Protestant Episcopal church. A reply was sent, acknowledging the reasonableness of hesitation on their part and furnishing copies of the ecclesiastical constitution and the Proposed Book, as evidences of the soundness of the American church in doctrine, discipline, and worship. The English bishops expressed dissatisfaction with the liturgical changes of the Proposed Book, insisting only on the restoration of the Apostles' Creed in its integrity, yet urging a retention of the Nicene and Athanasian creeds, even if the use of them were merely

optional. Before an answer to this could be sent, another communication came from the Archbishop of Canterbury, inclosing the Act of Parliament authorizing the consecration of bishops for America and announcing that only three bishops would be consecrated.

The Convention of 1785, already twice adjourned, met again at Wilmington, Del., Oct. 10, 1786, and consented to restore the Apostles' Creed in its integrity, introduced the Nicene Creed into optional use, but declined even to insert the Athanasian Creed. Other changes of legislation, not very essential, commended by the English bishops, had either been already accomplished or were now conceded. It was found that three bishops had already been elected by their respective diocesan conventions—Dr. Samuel Provoost of New York, Dr. William White of Pennsylvania, and Dr. David Griffith of Virginia. Their testimonials were signed by the Convention, and two of them, Drs. White and Provoost, were consecrated in the chapel of Lambeth Palace on Feb. 4, 1787.

The General Convention of 1789 met in Philadelphia, to ratify the constitution, establish the Prayer Book, and enact necessary canons. It was of the utmost importance that there should be unity of the Episcopal church throughout the length and breadth of the land. The times were more favorable than before for this consummation. The national spirit had been attuned to unity by the ratification of the constitution and the election and inauguration of Washington three months earlier. The ecclesiastical spirit had been so far modified since 1785, by correspondence and consideration, that the Convention at once formally affirmed the validity of Bishop Seabury's consecration and enacted 10 canons, which showed increased and marked respect for the episcopal office. They adopted the constitution with such alterations as allowed representation of a church by clerical members only and provided for a separate House of Bishops when there should be three of that order.

On August 8 the Convention took a recess, during which Bishop Seabury and the New England churches concluded, in view of its action, to join it; and when it reassembled, on September 30, it represented the whole church in all its orders. A Prayer Book was adopted—not the Proposed Book, which had cost so much labor, but a simple adjustment of the English Prayer Book to American conditions, with certain verbal omissions and rubrical emendations, which, however, left it essentially the same book. (See PRAYER BOOK, COMMON.) The Communion Office, in accordance with the wishes of Bishop Seabury, was perfected by closer adherence to the Scottish, and therefore to the Eastern, liturgies. The Convention adjourned October 16, leaving the Protestant Episcopal church fully organized.

For 20 years its energy seemed to have been exhausted by its organization. It was unpopular, as being identified with the English church. It was not alert in action. Its worship was regarded as formal, its discipline as lax. The 20 clergymen and 16 laymen of the Convention of 1789 were increased by only five clerical and four lay representatives in 1811: and only once in those 22 years were there as many as five bishops at any General Convention.

From the latter date, however, the church took a vigorous start, whose impulse has been felt ever since. It was due chiefly to three men—Bishops Hobart of New York, Griswold of New England, and Channing Moore of Virginia—who reconstructed the church in their dioceses, both in number and in character. The leaven spread more widely still. In 1817 some of the Western States were organized into dioceses, and in 1820 the church is reported as organized, though not supplied with bishops, in all the original States. The pioneer Bishop of the West was Philander Chase, consecrated in 1819. Two dioceses, Ohio and Illinois, of which he was successively Bishop, and two colleges, Kenyon and Jubilee, founded by him, are his monuments. John Stark Ravenscroft, consecrated Bishop of North Carolina in 1823, did a similar work in the wilder regions of the South, and in seven years changed a diocese of four churches into one of 23.

By the time of Bishop White's death, in 1836, two great changes had begun to be apparent, which were to characterize the next period. One was the crystallization of party spirit, which was destined to give rise to heated controversies. On the one side stood the old Evangelical party, represented by such distinguished men as Bishops Burgess, Eastburn, Chase, Lee, Alonzo Potter, M'Ilvaine, Bedell, and Stevens; by Richard Newton and Alexander H. Vinton and Francis L. Hawks; by Dr. Sparrow of the Virginian Seminary, its most learned theologian, and Stephen H. Tyng, for years its recognized leader. The opposite school, to whose growth a great impetus was given by the Oxford movement across the sea (though the earlier bishops, Seabury and Hobart and Ravenscroft, are to be classed with it), emphasized the objective, the institutional side of religion—a tendency especially natural in a country where the church was left to vindicate and sustain itself without aid or countenance from the state. While for a long time, by a sort of tacit compact, the foreign missionary work was left to the Evangelicals, the home field was cultivated rather by the High Churchmen. The General Theological Seminary (founded in New York in 1817 and molded by Bishop Hobart's influence) inclined its pupils to the views of the latter. Otey and Kemper in the West acted on their principles; Breck and Adams founded their associate mission at Nashotah on them. Bishop George Washington Doane of New Jersey, than whom no one in his day was more instrumental in shaping the history of the church, was the most commanding representative of this school, as Bishop Whittingham of Maryland was its most learned counselor.

The other distinctive feature of the central period of the nineteenth century was the expansion of the church beyond the narrow limits which had at first confined it. The General Convention of 1835 elected the first missionary Bishop so called—Jackson Kemper, who became the apostle of the northwestern territory lying east of the Rocky Mountains, founding and fostering the church in Missouri, Indiana, Iowa, and Minnesota. Such vast and unexplored regions were confined to the charge of single bishops that one of them used playfully to style himself Bishop of All-outdoors; but their labors were so earnest and continuous that it was only a logical consequence of them when, in 1859, the General Convention made the epis-

copate coextensive with the boundaries of the United States.

The history of the Episcopal church at the time of the Civil War is of special importance because of its bearing on both national and religious reunion after peace had been restored. To the influence which it had acquired by the abstinence of its clergy from political strife, the delay of the actual conflict was largely due; and a strikingly fraternal spirit prevailed in its councils throughout even the height of the bitter struggle. When the General Convention met in New York in 1862, seats were assigned to the Southern bishops and deputies, and their names were called as usual. The latter had considered themselves forced to outward ecclesiastical separation, but declared that, "though now found within different political boundaries, the church remains substantially one." By the time that the next General Convention met peace had been declared; and so tactfully were the delicate questions of the moment handled that complete reunion was effected with the least possible friction. The whole attitude of the church gained public respect and confidence, and the manner in which it led the way in reunion was of undoubted service to the work of national reconstruction.

After the reunion of churchmen as citizens had been thus happily accomplished, they were for a while divided in spirit by fierce theological controversies. A determined attempt was made to suppress the outward developments of what is known as ritualism, especially in the General Conventions of 1868, 1871, and 1874. The opposing parties valued or condemned these external manifestations, not for their own sake, but because of the doctrines they were supposed to symbolize, which were held by their opponents to be practically those of the Roman Catholic church. In spite of the eloquent arguments of the leader of the High Church forces, the distinguished warden of Racine College, James De Koven, a canon which marks the height of the movement in favor of repression was passed in 1874, limiting the ritual which might be employed in the celebration of the Holy Communion; but it remained practically a dead letter until its repeal in 1904. The question of baptismal regeneration was also productive of heated debate; in 1871, 48 out of 53 bishops issued a declaration that in their opinion "the word regenerate in the offices for the ministration of baptism of infants is not there so used as to determine that a moral change in the subject of baptism is wrought in the sacrament." This failed, however, to satisfy the extreme Low Churchmen, a number of whom withdrew in 1873, under the leadership of Dr. Cummins, then Assistant Bishop of Kentucky, and constituted the Reformed Episcopal church (q.v.).

Partly through the withdrawal of these aggressive elements, and partly through the general drift of opinion in the church, the old Evangelical party, as a party, has had less and less influence in late years. The High Church party, on the other hand, has grown continuously both in numbers and influence; and what were advanced ritualistic practices a generation ago are now placidly accepted by the most moderate churchmen. At the same time the Broad Church school, which was an outcome of the movement of Maurice and Kingsley and Stanley in England, has attained a large and

increasing share of power. The two older parties agreed in their insisting on the importance of dogmatic belief, differing only as to which particular set of dogmas were to be emphasized. The new one stands for individual freedom of both thought and action and looks doubtfully upon claims to absolute authority, whether in church or Bible. In its conception of applied Christianity it is largely humanitarian and is forward to provide for the temporal as well as the spiritual needs of men.

By this growing latitude of belief on the one hand, and by its connection with the historic past and its dignified liturgical form of worship on the other, the Episcopal church has in recent years appealed so strongly to numbers of educated men and women as to make natural its consideration of itself as a possible centre and rallying point for the reunion of the widely varying forms of Protestant Christianity in America. This movement really began with the memorial presented to the House of Bishops in 1853 by Dr. Mullenberg, a man far in advance of his generation in many particulars, which looked to "some ecclesiastical system broader and more comprehensive . . . providing for as much freedom in opinion, discipline, and worship as is compatible with the essential faith and order of the Gospel." This spirit of conciliation found definite expression in the declaration of the House of Bishops in 1886, which was confirmed, with some minor changes, by the Lambeth Conference two years later. It set forth as an irreducible minimum, "as inherent parts of the sacred deposit, and therefore as essential to the restoration of unity among the divided branches of Christendom: (1) the Holy Scriptures of the Old and New Testament as the revealed word of God; (2) the Nicene Creed as the sufficient statement of the Christian faith; (3) the two sacraments—baptism and the supper of the Lord—ministered with un-failing use of Christ's words of institution and of the elements ordained by Him; (4) the historic episcopate locally adapted in the methods of its administration to the varying needs of the nations and peoples called of God into the unity of His Church." This is the "Chicago-Lambeth quadrilateral."

The general position of the Episcopal church is explicitly declared in the preface to the Prayer Book, which states that "this Church is far from intending to depart from the Church of England in any essential point of doctrine, discipline, or worship." Its organization in spiritual matters is substantially the same as that of the mother church, with which it maintains close relations, made more effective by the participation of American bishops in the Lambeth conferences, held approximately every 10 years. (See *ANGLICAN COMMUNION; LAMBETH CONFERENCE*.) Its constitution, of which a revision, together with a revised body of canons, was adopted in 1904, is in many particulars analogous to that of the nation, except that the powers of its executive head are strictly limited and hardly more than nominal. He is called the Presiding Bishop, and is the senior Bishop in order of consecration. A movement in favor of facilitating the government of the church culminated in 1904, when constitutional provision was made for a division of the country into strictly organized provinces, with a metropolitan see at the head of each, and when eight

judicial "departments" for Courts of Review were established by canon.

In legislative matters, for purposes affecting the whole church, the General Convention is supreme. The body, which meets triennially in different places, is composed of two houses, the House of Bishops, consisting of all bishops of the United States and foreign missionary bishops, and the House of Clerical and Lay Deputies, composed of four clergymen and four laymen elected from each diocese: missionary jurisdictions are represented in the House of Deputies by one clergyman and one lay delegate. Legislation, to be effective, must be passed by a concurrence of both houses and, in the lower house, of both orders. At the General Convention held in New York City in October, 1913, provision was made for the further organization under a provincial system according to which the dioceses and missionary jurisdictions in the United States and its colonies are grouped in eight provinces, each to have certain functions as to organization, holding of conventions, and legislation, but in subordination to the general organization. Each diocese holds its own annual convention, composed in most instances of the clergy canonically resident within it, and of lay delegates for each parish, sitting as one house and presided over by the Bishop. The General Convention can make no alteration in the constitution or the Prayer Book until it has been laid over for three years, officially signified to every diocese, and passed again at the subsequent Convention. The diocesan conventions legislate for the internal affairs of each diocese, in harmony with the general canons. Each diocese has also a standing committee, composed of both clergy and laity, which has various administrative functions, and in the case of a vacancy in the see acts as the "ecclesiastical authority" of the diocese: the election of new bishops must be confirmed by a majority as well of the standing committees as of the other bishops of the whole church.

In 1914 there were 67 dioceses and 21 missionary districts (which may be described as embryo dioceses) in the United States and its colonies; also one missionary district in Africa, one in Cuba, one in Mexico, three in China, and two in Japan, besides two bishoprics, not strictly forming a part of the Episcopal church, in Brazil and Haiti. There were also nine organized chaplaincies on the continent of Europe, which minister primarily to Americans. The organized parishes and missions in the United States, including Alaska, Honolulu, the Philippine Islands, and Porto Rico, in 1914 numbered 8326, and the clergy 5715, including 116 diocesan, coadjutor, and missionary bishops. There were 1,004,217 communicants, 51,267 Sunday-school teachers, and 460,091 Sunday-school scholars. During the year 69,639 persons were baptized and 55,771 confirmed. The total contributions for the year amounted to \$19,489,309.

As the church has expanded, many new agencies have arisen to foster and extend its exuberant life. (Chief among these are 18 sisterhoods (q.v.) in which women are bound together for work and devotion, three religious orders for men, and the revived order of Deaconesses (q.v.); the Domestic and Foreign Missionary Society, to which every baptized member of the church is considered *ipso facto* to belong; the Brotherhood of St. Andrew (q.v.), which enlists

the active work of laymen, and the church clubs, also for laymen, of which there are 24; the Daughters of the King (q.v.), for women; the Church Temperance Society (q.v.); the Parochial Missions Society, and the American Church Sunday School Institute. Church hospitals, begun by Dr. Muhlenberg with St. Luke's in New York and followed by the Episcopal Hospital in Philadelphia, have exemplified the humanitarian side of religion; while schools under religious influence, which owe their inception to the same far-seeing founder, have multiplied throughout the country. Colleges such as those at Hartford, Geneva, Racine, Sewanee, Gambier, and South Bethlehem, provide for higher education. Schools for the training of clergy are maintained in New York City (established 1817); Theological Seminary, Fairfax Co., Va. (1823); Gambier, Ohio (1828); Nashotah, Wis. (1842); Middletown, Conn.; Philadelphia, Pa., (1857); Sewanee, Tenn. (1857); Faribault, Minn. (1858); Geneva, N. Y.; Cambridge, Mass. (1867); Denver, Colo. (1871); Syracuse, N. Y. (1876); Topeka, Kans.; Chicago, Ill. (1885); San Mateo, Cal. (1894); Petersburg, Va. (1884), and Washington, D. C. (1891), for colored students; and Tokio, Japan. The principal organs of the church in the press are *The Churchman* (New York), *The Living Church* (Milwaukee), and *The American Catholic* (San Francisco). Other church publications are *The Parish Visitor* (New York), *The Spirit of Missions* (New York), *The Church Militant* (Boston), and *St. Andrew's Cross* (Boston).

EPISCOPAL CHURCH, REFORMED. See REFORMED EPISCOPAL CHURCH.

EPISCOPAL THEOLOGICAL SCHOOL. An institution for the education of Episcopal clergymen, situated at Cambridge, Mass. It was founded in 1867 by Benjamin Tyler Reed.

The school offers courses leading to the degree of B.D., which is conferred on students holding bachelor's degrees. The principal buildings include the chapel, the deanery, the library, and Reed, Burnham, Lawrence, and Winthrop halls. The students in 1914 numbered 56. The school is affiliated with Harvard University.

EPISCOPIUS (Neo-Lat., from Lat. *episcopus*, Gk. *ἐπίσκοπος*, *episkopos*, bishop; a translation of his Dutch name, *Bisschop*, Bishop), SIMON (1583-1643). A Dutch theologian, after the death of Arminius the head of the Arminian party. He was born in Amsterdam, studied at Leyden, took his degree of M.A. in 1606, and was ordained pastor of the village of Bleywyck near Rotterdam, in 1610. In the following year the States-General, with the intention of putting an end to the agitations created by the controversies between the Gomarists, or Calvinistic party, and the Arminians, or Remonstrants, ordered a conference to be held in their presence at The Hague between six ministers of each party. Episcopus was one of the six charged with the advocacy of Arminianism and highly distinguished himself by his good temper, ability, and learning. In 1612 the curators of the University of Leyden appointed him professor of theology in the place of Gomarus, who had gone to Zealand; this enraged the leaders of the orthodox party, who unscrupulously accused him of Socinianism. This was one factor in the calling of the Synod of Dort (q.v.), 1618-19. Episcopus was present, along with several other Arminians; but the Calvinists, who were in an overwhelming majority, would not allow him to speak. He was expelled from the church and banished from the country. Episcopus betook himself first to Antwerp and afterward to Rouen and Paris, but in 1626 returned to Rotterdam. In 1634 he was made professor of divinity in the newly established seminary of the Remonstrants in Amsterdam. His works were published in Amsterdam (1650-65). The chief are the *Confessio Remonstrantium* (1621) and the *Apologia pro Confessione* (1629). Consult Calder, *Memoirs of Simon Episcopus* (London, 1838). See GOMARUS; ARMINIUS.

EPISTATES, ἐπιστάτης (Lat., from Gk. *ἐπιστάτης*, commander, president, from *ἐπιστάβαι*, *ephistasthai*, to preside, from *ἐπὶ*, *epi*, upon, over + *στάβαι*, *histanai*, to stand). In general, the title in ancient Greece of any officer in charge of certain functions, but in particular the title of the presiding officer of the two great Athenian councils, the Ecclesia and the Senate of Five Hundred. (See BOULE.) The Senate was divided into 10 bodies, representing the 10 tribes, of 50 members each, and each body of 50 acted in turn as a committee of both councils for a period of from 35 to 39 days. The members of this committee were called Prytanes, and every day there was chosen from among their number a single member, called the Epistates of the Prytanes, or briefly the Epistates, to act as chief presiding officer for that day.

EPISTAXIS (Neo-Lat., corrupted from Gk. *ἐπιστάξις*, *epistagmos*, nose-bleed, from *ἐπιστάξω*, *epistazein*, to bleed at the nose, from *ἐπὶ*, *epi*, upon + *στάξω*, *stazein*, to drip). Hemorrhage from the nose, a symptom of various conditions. It occurs in some people frequently after heavy work or exertion causing the heart to beat violently, or during paroxysms of coughing, as in whooping cough. It may be a premonitory symptom of typhoid fever, or it may be

a symptom of disease of the heart or kidneys in which the blood vessels are diseased, or during purpura or hæmophilia (q.v.). Menstruation sometimes manifests itself, vicariously, as a nosebleed. It is caused by picking the nose, whereby small ulcerations are produced. If it does not stop through spontaneous clotting in the nostril or after pressure of the wing of the nostril against the septum, it may be necessary to have a physician look into the nostril, find the bleeding point, and apply cotton alone or moistened with adrenalin or tannin or alum to it. In serious cases the nostril must be plugged in front and behind in the throat. In hæmophilia, a disease in which the blood loses its plasticity or clotting power, nosebleed may be fatal. See BLEEDING.

EPISTEMOLOGY (from Gk. ἐπιστήμη, *epistēmē*, knowledge, from ἐπιστάσθαι, *epistasthai*, to know + λόγια, *-logia*, account, from λέγειν, *legein*, to say). A technical term, probably originated by Ferrier, and used in philosophy to designate that branch of inquiry which deals with the origin, validity, and limits of our knowledge. Before we can arrange and classify scientifically the knowledge we have attained, it is necessary, so some have claimed, to have at least a theory to account for our possession of it and to guarantee its value. Epistemology is often differentiated from psychology by its dealing with the validity of knowledge rather than with the analysis of the knowing mind (structural psychology), or with the development of cognition (genetic psychology), or with the part the knowledge plays in life (functional psychology). In recent literature, especially in pragmatic circles, epistemology is used in a dyslogistic sense as applied only to those theories of knowledge which regard knowledge as a thing to be considered in a different way from other subjects of inquiry and which therefore repudiate in this study the methods in vogue in the natural sciences. Such a theory was Kant's, who maintained that there are *a priori* (q.v.) percepts and concepts, that a careful listing and examination of these are prerequisite to any acceptable metaphysics, and that there can be genuine knowledge, as distinct from disconnected sensations, only when these *a priori* percepts and concepts have played their part in constructing the object known.

But there is no very good reason to confine the term "epistemology" to just one type of dealing with knowledge. Whether a philosopher regards knowledge as having a transcendental origin or a biological origin, whether he treats knowledge as a thing unique or as an instrument of adjustment when difficulties are met in experience, he has a theory of knowledge or an epistemology. Consult, for the Kantian epistemology, the works referred to under KANT. For more recent views, consult: Dewey, *Studies in Logical Theory* (Chicago, 1903); *The Influence of Darwin on Philosophy* (New York, 1910); James, *Pragmatism* (ib., 1907); *The Meaning of Truth* (ib., 1909); *Essays in Radical Empiricism* (ib., 1912); Bergson, *Creative Evolution* (Eng. trans., ib., 1911); Marvin, in *The New Realism* (ib., 1912). See KNOWLEDGE, THEORY OF; INSTRUMENTALISM; PRAGMATISM.

EPISTLE (AS. *epistol*, OF. *epistle*, *epistre*, Fr. *épître*, Lat. *epistola*, from Gk. ἐπιστολή, *epistolē*, letter, from ἐπιστέλλειν, *epistellein*, to send, from ἐπὶ, *epi*, upon + στέλλειν, *stellein*, to send). Properly, a letter; used specially for a letter

intended for publication, or which, having been published, belongs to literature. The 21 books of the New Testament immediately following the Book of Acts are called the Epistles, having been originally letters or cast in epistolary form. The first 13, traditionally assigned to St. Paul, used to be called the Apostle. The two epistles to Timothy and that to Titus are called the pastoral Epistles because they treat of the duties of a pastor. The general or catholic Epistles are those of Peter, James, John, and Jude. For discussion of the authorship, date, and other questions connected with these books, see the articles on the separate books.

The lesson in the liturgy which precedes the gospel for the day is called the epistle, because generally taken from the New Testament Epistles; in the Middle Ages, because most of them were taken from St. Paul, it was frequently called the apostle. In the earlier ages it was customary to read two lessons, one from the prophets and one from the Epistles, on feast days. In the modern Roman missal many of the epistles are taken from the Old Testament; on a few days two lessons are still read in this place, on Ember Saturday six, of which the first five are from the Old Testament. St. Jerome is said by the mediæval liturgical writers to have made the selection of the epistles and gospels at the request of Pope Damasus. The epistle was formerly read or sung from the ambo (q.v.); about the end of the Middle Ages it became customary to recite it facing the altar. Being addressed to the faithful, it is read at the south side of the altar, which in mediæval symbolism typifies the quarter of light, while the gospel, preached to the heathen, is read towards the north, the quarter of darkness and evil. Down to the eighth century the *lector*, or reader, was charged with the recitation of the epistle; then it was attributed to the subdeacon, not at first as a function of his office, but as a concession.

EPISTLES, SPURIOUS. See APOCRYPHA.

EPISTLE SIDE OF THE ALTAR. The left side of the altar or communion table, looking from it, at which in the church service the epistle of the day is read. It is of lesser distinction than the right, or gospel, side and is occupied by the clergymen of lower ecclesiastical rank. In early churches, when in the choir there was an ambo (q.v.) on each side—one for the epistles, the other for the gospels—the term was applied to the choir also.

EPISTLES OF HORACE. A series of poems by Horace, in the form of letters to individuals, published between 20 and 12 B.C. They are a continuation of the *Satires*, but differ from the latter in their more tolerant and philosophical atmosphere, in their better taste, and in literary form. They are arranged in two books, and are in hexameter verse. The *Epistula ad Pisones* is a famous piece of criticism, better known as the *Ars Poetica* (q.v.).

EPISTOLÆ OBSCURORUM VIRO RUM (Lat., Letters of Obscure Men). The title of a collection of satirical letters which appeared at Hagenau in 1515, professing to be issued by the Aldine Press at Venice. It purported to be the composition of certain ecclesiastics and professors in Cologne and other places in Rhenish Germany. The letters were directed against the scholastics and monks and helped in no small degree to bring about the Reformation. The controversy of Reuchlin (q.v.) with the baptized

Jew Pfefferkorn concerning the destruction of the Talmudic books gave the first occasion to the *Epistolæ*, and probably their title was suggested by the letters to himself from distinguished men which Reuchlin published, under the title *Virorum Epistolæ Clarorum ad Reuchlinum Phorcensem* (1514), to show that his position in this controversy was approved by the learned. The *Epistolæ Obscurorum* were addressed to Ortuinus Gratius in Deventer, who had made himself odious to the liberal minds of the time by his arrogant pretension, his determined hostility to the spirit of the age, and his lax morality. On the first appearance of the work it was ascribed to Reuchlin, afterward to Reuchlin, Erasmus, and Hutten. The first part contained 41 letters, a number which was increased in subsequent editions. It was probably mainly the composition of the distinguished humanist Crotus Rubianus, who originated the idea. In the composition of the second part (1519) Ulrich von Hutten had much share, but others participated, including Crotus. The *Epistolæ* were placed in the catalogue of forbidden books by a papal bull. The classical edition is that by Bücking, *Supplementum Ulrici Hutteni Operum*, vols. vi, vii (Leipzig, 1864-70). There is a German translation by Binder (Stuttgart, 1876). Consult: Strauss, *Ulrich von Hutten* (6th ed., Leipzig, 1895), of which there is an English translation (London, 1874); Pattison, *Essays* (Oxford, 1889); Brecht, *Die Verfasser der Epistolæ Obscurorum Virorum* (Strassburg, 1904).

EPISTOLER, or **EPISTLER**. An English term for the clergyman (answering to the subdeacon in the Roman mass) who, in accordance with the twenty-fourth canon of 1603, assists the celebrant in the administration of Holy Communion. The name is derived from the fact that his principal duty is to read the epistle. See **GOSPELER**.

EPISTROPHE. See **CHLOROPLAST**.

EPISTULÆ EX PONTO (Lat., Letters from Pontus). Four books of letters, written by Ovid from his place of exile on the Black Sea. In them the poet bitterly complains of his dreary life and his separation from his family and appeals frantically to his friends at Rome to intercede for him with the Emperor. As were the *Tristia*, which preceded them, the letters are in the elegiac measure (see **DISTICH**; **ELEGY**), but give the names of the persons addressed.

EPISTYLIUM or **EPISTYLE** (Lat., from Gk. ἐπιστύλιον, *epistylon*, from ἐπὶ, *epi*, upon + στυλος, *stylos*, column). A beam of stone or sometimes of wood, which rests upon the capitals of columns or pillars and spans the space between them. It is synonymous with the more customary term "architrave" (q.v.). See **COLUMN**.

EPITAPH (Lat. *epitaphium*, *epitaphius*, from Gk. ἐπιτάφιος, *epitaphios*, funeral, from ἐπὶ, *epi*, upon + τάφος, *taphos*, tomb: supply λόγος, *logos*, word, utterance). Properly a brief commemorative inscription on a tomb or other monument over a grave. The oldest inscriptions of this kind are inscriptions on ancient Egyptian sarcophagi. These epitaphs all contain simply a statement of the name, family, and condition of the deceased, with a prayer to some deity, generally Osiris or Anubis. The earliest Greek epitaphs are from the island of Thera and date from a time as early at least as the seventh century B.C. They contain simply the name of the deceased. The earliest Athenian epitaphs are also very short, containing hardly more than

the name of the deceased, together with that of the deceased's father, and are often written in verse, generally in an elegiac distich. The Greek epitaphs from later times are often of considerable length and are very various in character; they are frequently, also, in the form of the epigram. Roman epitaphs were much more meagre than the later Greek epitaphs. On the Roman urns are the letters D.M. or D.M.S. (*Dis Manibus* or *Dis Manibus Sacrum*), followed by particulars with regard to the deceased, his age, name, and office, and the name and relationship of the person who has had the urn made. The letters D.M. frequently occur in Christian epitaphs found in the Catacombs. A not uncommon feature of the Roman inscription is the strong adjuration addressed to the passers-by not to disturb the tomb, and a grievous curse for the man who should violate this injunction. They contain often, also, an admonition to the passer-by to stop and read the record on the tomb. Latin remained till very recent times the usual language for epitaphs in England, at least in the case of famous men and women.

In modern as in ancient times, the epitaph has been made a literary form, as, e.g., by Ben Jonson and Pope. Dr. Samuel Johnson wrote an essay on epitaphs; so, too, did William Wordsworth. For Greek epitaphs, consult: Kaibel's *Epigrammata Græca ex Lapidibus Collecta* (Berlin, 1878); Reinach, *Traité d'épigraphie grecque* (Paris, 1885); Preger, *Inscriptiones Græcæ Metricæ ex Scriptoribus præter Anthologiam Collectæ* (Leipzig, 1891); *Corpus Inscriptionum Atticarum* (Berlin, 1878-82). For Latin epitaphs: *Corpus Inscriptionum Latinarum* (ib., 1863 et seq.); Bücheler and Riese, *Anthologia Latina*, vol. ii (Leipzig, 1869-70), especially the second part, *Carmena Epigraphica Latina* (ib., 1895-97), interestingly reviewed by Abbott, in *American Journal of Philology*, vol. xix (New York, 1898); Tolman, *A Study of the Sepulchral Inscriptions in Bücheler's Carmena Epigraphica Latina* (Chicago, 1910); Clara L. Thompson, *Tadium Vitæ in Roman Sepulchral Inscriptions* (St. Louis, 1911); Armstrong, *Autobiographical Elements in Latin Inscriptions* (New York, 1910); Cholodniak, *Carmena Sepulcralia Latina* (St. Petersburg, 1897). For modern epitaphs, consult: Kippax, *Churchyard Literature: A Choice Collection of American Epitaphs* (Chicago, 1876); Andrews, *Curious Epitaphs* (London, 1883). See **EPIGRAM**; **ANTHOLOGY**; **SIMONIDES** (OF CEOS).

EPITHALAMIUM (Lat., from Gk. ἐπιθάλμιος, *epithalamios*, nuptial, from ἐπὶ, *epi*, upon, at + θάλαμος, *thalamos*, bridal chamber: supply ὕμνος, *hymnos*, hymn). Among the ancient Greeks and Romans a marriage song sung by a chorus of maidens, or of youths and maidens, before the chamber of a newly married couple. It was sung ordinarily on the evening of the marriage day; but there was also a waking song. Closely connected with the epithalamium is the hymeneal song (ὕμναιος), which was sung either at the wedding banquet or during the marriage procession to the new home. As a general term, the hymeneal includes the epithalamium. Among the Greeks the epithalamia and hymeneals of Sappho were prized above all others; but Aleman, Anacreon, Stesichorus, Pindar, and others also composed such marriage hymns. The eighteenth Idyl of Theocritus is an epithalamium on the marriage of Menelaus and

Helen. At Rome, in the first century a.c., the Alexandrine school of poets practiced epithalamia after Greek models. Three by Catullus are extant (Nos. 61, 62, and 64), in which the Greek form is greatly modified. The epithalamium gradually became a laudatory poem on the occasion of a wedding; in this form it was cultivated in the Imperial period, by Statius, Ausonius, Sidonius Apollinaris, and Claudianus. A collection of Latin epithalamia, with an introductory essay, is to be found in Wernsdorf, *Poetae Latini Minores*, vol. iv (Helmstedt, 1789). In modern times epithalamia have been written in Latin, Italian, and French; in English epithalamia were composed by Spenser, Ben Jonson, Donne, Quarles, and Tennyson (at the close of *In Memoriam*).

EPITHALAMIUM. A poem by Edmund Spenser, written to celebrate his marriage to Elizabeth Boyle (June 11, 1594).

EPITHELIOMA (Neo-Lat., from Gk. *ἐπί*, *epi*, upon + *θηλή*, *thēlē*, nipple, from *θάν*, *than*, to suckle). A variety of cancer, which attacks surfaces covered with epithelium or epidermis. See TUMOR.

EPITHELIUM (Neo-Lat., from Gk. *ἐπί*, *epi*, upon + *θηλή*, *thēlē*, nipple). A tissue widely distributed in the animal body. Its main function

FIG. 1. SQUAMOUS EPITHELIUM OF EPIDERMIS. Magnified 250 times: a, squamous cell; b, nucleus.

may be said to be that of acting as a covering for various surfaces, both external and internal, and as the active structural elements of those

FIG. 2. SQUAMOUS EPITHELIUM OF OMENTUM.

Magnified 250 times: a, silvered outlines of cell; b, nucleus.

organs of the body which are known as glands. Thus, as the outer layer of the skin, epithelium covers the entire body and forms the hair, nails, sweat glands, etc. It covers all the mucous membranes, thus lining the entire respiratory tract, the genito-urinary tract, and the alimentary canal. It forms the essential elements of the true glands, such as the liver, pancreas, and submaxillary. Epithelium may be classified as follows: I. Squamous: (a) simple, (b) stratified. II. Columnar: (a) simple, (b) stratified. III. Modified: (a) ciliated, (b) goblet, (c) pigmented. IV. Special: (a) glandular, (b) neuro-epithelium.

I. Squamous Epithelium. (a) Simple Squamous Epithelium.—This is not abundant in the human body. It lines the air spaces of the lungs, the membranous labyrinth of the ear,

FIG. 3. TRANSITIONAL EPITHELIUM OF BLADDER.

Magnified 300 times: a, superficial layer of cells; b, intermediate layer of cells; c, deep layer of cells; d, fibrous tissue.

and occurs in a few other places. It consists of a single layer of flat cells, presenting the appearance of a mosaic when seen from the flat surface. (b) Stratified Squamous Epithelium.—Here the cells are laid down in several layers, only the surface cells being flat, the deeper layers irregular or cuboidal in shape, the innermost layer resting on a distinct membrane, the *membrana propria*. Sometimes the cells of the middle layers are united by minute spines and are known as prickly cells. The main locations of this form of epithelium are the skin and all its openings—the esophagus, larynx, pharynx, ureter, bladder, pelvis of the kidney, the entire female urethra, and the terminal portion of the male urethra.

II. Columnar Epithelium. (a) Simple.—This consists of a single layer of columnar cells placed side by side, their bases resting on a thin membrane, the *membrana propria*, or basement membrane. Epithelium of this type lines the entire alimentary tract, the ducts of glands, and their alveoli, and portions of the male urethra. (b) Stratified Columnar Epithelium.—Only the surface cells are truly columnar, the deeper layers being made up of cells irregular in shape.

FIG. 4. COLUMNAR EPITHELIUM OF INTESTINE.

Magnified 300 times: a, layer of columnar epithelial cells; b, striated hem of epithelial cells; c, mucous cell.

It is not widely distributed, examples being found in the *vas deferens* and in the nasal fossa.

III. Modified Epithelium. (a) Ciliated.—These cells have minute, hairlike projections from their free surfaces, known as cilia. These cilia possess a vibratory motion, always acting in the same direction and thus determining flow

of currents. They occur only on columnar epithelium, either of the simple or stratified type. Ciliated epithelium lines the cavity of the uterus, the oviducts, the lacrymal ducts, the

FIG. 5. CILIATED EPITHELIUM OF TRACHEA.

Magnified 300 times: a, ciliated cells; b, goblet or mucin cells; c, germinal cells; d, basement membrane.

Eustachian tubes, and parts of the tympanic cavity, nasal fossæ, larynx, trachea, bronchi, and *vas deferens*. These minute cilia exert a considerable power. Thus, in the respiratory tract they seem to keep the tubes free from any minute particles of foreign substance which may have entered them. (b) *Goblet*.—This is a form of cell occurring in columnar epithelium in

FIG. 6. DISSOCIATED GOBLET EPITHELIUM FROM INTESTINE.

Magnified 450 times: a, nucleus; b, remains of protoplasm of cell.

which the contents of the cell are transferred into a transparent substance known as mucus, which is finally discharged upon the free surface of the membrane. (c) *Pigmented*.—In this form of epithelium the cells contain granules usually of a brown or black color and known as pigment. Such cells

are found in the retina and in the skin, especially of the darker races.

IV. Specialized Epithelium. (a) *Glandular Epithelium*.—This name is applied to those forms of epithelium which make up the various glands of the body. Such epithelium presents wide ranges of variations for different glands. (b) *Neuro-Epithelium*.—This is a specialization of epithelium for the purpose of forming terminations for nerve fibres. Many of these terminations in certain organs are extremely complex—e.g., the rods and cones of the retina, the hair cells of Corti's organ, and the taste buds. Consult Bailey and Miller, *Textbook of Histology* (New York, 1913), and Stirling, *Principles of Human Physiology* (London, 1912).

EPITHEM (Gk. ἐπίθημα, *epithēma*, cover, from ἐπὶ, *epi*, upon + θῆμα, *thēma*, box, from τίθημι, *tithēmi*, to place). In plants, the internal tissue of a hydathode; a gland that excretes water. See HYDATHODE.

EPITOME, ἐπίτμῃ (Lat., from Gk. ἐπιτομή, from ἐπὶ, *epi*, upon + τμή, *tomē*, a cutting, from τέμνω, *temnō*, to cut). A condensation of the work of an author or of an encyclopedia or the like. Condensations were frequently made by mediæval scholars, and the practice is not rare in later times; witness the condensed version of Richardson's interminable novel *Clarissa Harlowe*, that of the French encyclopædia *Larousse*, and the *Epitome* (1906) in one volume of the *monumental Dictionary of National Biography*.

EP'IZO'A. See ENTOMOZOA.

EPIZOÖTIC, ἐπιζωοτική (Gk. ἐπὶ, *epi*, upon + ζῷον, *zōon*, animal). A disease which is carried from one place to another by means of infection, and which occurs as a more or less serious outbreak of limited duration. Epizootic in veterinary medicine corresponds to the term "epidemic" in human medicine. See INFLUENZA IN ANIMALS.

E PLURIBUS UNUM (Lat., one out of many). The national motto of the United States, proposed by Franklin, Adams, and Jefferson, the committee appointed by Congress on July 4, 1776, to prepare designs for a seal.

EP'ŌCH, ἐπ'ὸχ or ἐπ'ὸκ (ML. *epocha*, Gk. ἐποχή, *epochē*, epoch, pause). In astronomy, one of the elements (q.v.) of a planet's orbit. It is necessary that these elements should include a statement of the date when the planet passed through perihelion, or its point of nearest approach to the sun. That date, with the hour and exact fraction of an hour, is called the epoch. It may also be an arbitrary fixed date—generally the beginning of a century or half century—to which all the elements are referred. The heliocentric (q.v.) longitude is then given for this instant, and this is frequently referred to as the epoch; more properly, it is the longitude of the epoch. See also CHRONOLOGY.

EPOCH, IN GEOLOGY. See GEOLOGY.

EP'ODE (Lat. *epodus*, from Gk. ἐπὸδος, *epōdos*, epode, from ἐπὶ, *epi*, upon, in addition to + ὄδῃ, *odē*, song, from δίδωμι, *didōmi*, to sing). A name given by grammarians to any poem in which the metrical unit is a distich, consisting of a long verse and a shorter verse, especially when an iambic trimeter is followed by an iambic dimeter, as in Horace's *Epodes* 1-10. *Epodes* of this sort had been written by Archilochus (q.v.) and Stesichorus (q.v.). In the distich here used the second verse of such couplet is a sort of metrical refrain. Horace called these poems *Iambi*, partly by reason of their metre, partly because in them he reproduced the censorious spirit of the poems of Archilochus, themselves largely in iambic verse. Consult Sellar, *Horace and the Elegiac Poets*, 118-131 (Oxford, 1912). In Greek choral poetry the term is also applied to an ode which follows a strophe and an antistrophe, or a series of strophes and antistrophes, and so forms the third or after part, so to say, in the series.

EPOMEIO, ἑπόμεϊο (Lat. *Epomeus*, *Epopeus*). A volcanic mountain, rising to 2588 feet, 16 miles southwest of Naples, on the island of Ischia (Map: Italy, B 11). It is also called Mount San Nicola, from the hermitage of San Nicola, hewn in the rock just below the summit, which commands on the west a panoramic view of the sea; on the north, of the distant snow-capped peaks of the Abruzzi, of the Bay of Gaeta, and of the coast from Mount Circeo to Cape Miseno; on the east, of Vesuvius and of the Bay of Naples and its beautiful shore from the island of Procida to the island of Capri. On account of the eruptions of the volcano the island was deserted by most of the inhabitants in 474 B.C. The last of numerous recorded eruptions occurred in 1302; it left a stream of lava that is still plainly noticeable where it is crossed by the road near the town of Ischia. A large mass from Mount Epomeio was displaced by the earthquake of July 28, 1883. Mythology pictured the giant Typhæus (Vergil, *Æneid*, ix, 716), after being transfixed

by the thunderbolt of Jupiter, as buried beneath Mount Epomeo and by his struggles causing its eruptions.

EPOMEUS, EPOPEUS. See **EPOMEO**.

EPONA, ἐπὶ-νᾶ (Lat. *Epoma*). A goddess of stables and of horses, asses, and mules, worshipped first in ancient Gaul, and later, by the first century A.D., in Rome (Juvenal, viii, 157). She was believed to secure for the animals named above their food, and to protect them, not only against accidents, but against the malign beings that, it was thought, cast spells over stables by night. Inscriptions in her honor have been found in Gaul, Germany, the Danube country, and in Rome (in the latter city chiefly on the site of the barracks occupied by recruits from the Batavi). Consult Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

EPONYMUS (ἐπώνυμος, ἐπώνυμος, an adjective of various meanings, but for the purposes of this article definable as "giving one's name to something or someone," from ἐπὶ, upon, and ὄνομα, name). A term applied to the archon (q.v.) or to the ephor (see **EPHORI**) who gave his name to the year. The Greek tribes and cities commonly traced their origin to some eponymous hero; so the 10 tribes established at Athens by Cleisthenes were each named after some national hero.

EPORÉDIA. See **IVREA**.

EPOS. See **EPIC POETRY**.

EP'PING. A town of Essex Co., England, at the north end of Epping Forest, 17 miles north-northeast of London (Map: England, G 5). It is noted for its cream, butter, sausages, and pork, large quantities of which are sent to London. Pop., 1901, 3800; 1911, 4253. Epping Forest is a part of Waltham Forest, which covered all Essex and extended almost to London. It is now limited to a comparatively small area in the southwest part of the county. Here for many centuries a fair was held under the enormous Fairlop oak, no longer existent, and a stag was yearly turned out in the forest on Easter Monday to be hunted by the general public. In 1882, 5600 acres of Epping Forest were bought by the Corporation of London and declared free to the public in perpetuity.

EPPING FOREST. See **EPPING**.

EP'SOM. A market town on the margin of the Banstead Downs in Surrey, England, 14 miles south-southwest of London (Map: England, F 5). The famed sulphate of magnesia springs of Epsom gave their name to the Epsom salts formerly manufactured from them. The Royal Medical College erected on the Downs provides education for about 170 boys, the sons of medical men, and affords a home to indigent members of the profession and their widows. The electric-light and water supply are owned by the corporation. Pop., 1901, 10,900; 1911, 19,156. On the Downs, 1½ miles south of the town, the famous Epsom horse races are held yearly. They are said to have been held here in the reign of James I. See **HORSE RACING**.

EP'SOMITE. A natural hydrous magnesium sulphate corresponding in composition to Epsom salt (q.v.). It is usually found in white botryoidal masses and delicately fibrous crusts and is characterized by its bitter saline taste.

EPSOM SALT. A hydrous magnesium sulphate found native as the mineral kieserite and as epsomite, also in mineral waters. The kieserite is found in the Stassfurt salt beds, and the

epsomite occurs in the gypsum quarries of Montmartre, France, in Spain, in Chile, and in the limestone caves of Indiana, Kentucky, and Tennessee, and especially in the Mammoth Cave, Kentucky. It was originally obtained from the waters of the mineral spring in Epsom, England, and subsequently was made by decomposing dolomite with sulphuric acid; but the principal source of the commercial salt is now the Stassfurt salt mines in Saxony, where the crude mineral is separated from the accompanying magnesium and sodium chlorides by dissolving out these two salts with water, which leaves the magnesium sulphate as a fine powder that may be purified by crystallization from water. Epsom salt is used in medicine as a cathartic; it is also employed for agricultural purposes, in the process of warp-sizing cotton, and for dyeing with aniline colors.

EPSTEIN, JACOB (1880-). An English sculptor. He was born in New York, of Russian-Polish parentage, studied under Rodin in Paris, and later took up his residence in London. His first important work was 18 symbolical nude figures for the façade of the new building of the British Medical Association on the Strand (1907-08), placed 50 feet above the ground and representing "Hygiene," "Chemical Research," "Maternity," "Youth," etc. By reason of their excessive realism they excited the animosity of the press and various religious bodies, but they found able defenders in Herbert Gladstone and Sir Martin Conway. Epstein's tomb of Oscar Wilde in Père Lachaise Cemetery, Paris, was erected in 1909. Later he executed the decoration of Church Square, facing the government buildings, at Pretoria, Transvaal. His art is exceedingly modern and represents a revolt against mere prettiness in imitation of the Greek.

EP'WORTH LEAGUE. An organization of the young people of the Methodist Episcopal church, formed in 1889 at Cleveland, Ohio, by the combination of five young people's organizations at that time existing. The purpose of the league is the promotion of intelligent and vital piety among the young people of the church. It conducts classes in Bible study, missions, social service, and personal evangelism. Institutes are held annually, in which trained specialists give instruction in the different forms of Christian work. The league also supplements the work of the denomination in its various mission fields. The league exists in both the Northern and Southern branches of the Methodist Episcopal denomination and also in the Methodist church of Canada. In the latter it was organized in 1890. The Junior Epworth League is an organization of the baptized children over the age of 10 years. The admission of children not baptized is also permitted. Plans for the Junior League include a graded outline for the social life and activities coordinating the work of the boys' and girls' clubs, and a graded course of study covering a practical method of bringing the Bible in touch with the everyday life of children. Courses in Church history, government, doctrines, and benevolence are also included. The membership of the senior branch in the Methodist Episcopal church North in 1913 was 593,465, and of the junior branch 218,509. In the Methodist Episcopal church South there were, in 1913, 3846 chapters of the league, with 133,797 members. The headquarters of the Northern League are in Chicago, and

its organ is the *Epworth Herald*. The organ of the Southern branch is the *Epworth Era*, published monthly at Nashville, Tenn. Consult: Bacon and Northrop, *Young People's Societies* (New York, 1900); *The Methodist Year Book*; Dan B. Brummett, *Epworth League Methods* (ib., 1906).

EQUALITY. A vague term of varying signification in the recent history of social and political speculation. In its primary sense it denotes the equal worthiness of all human beings, and calls for such an arrangement of the structure of society as to insure to all an equal degree of the essential advantages of life. It is in this sense that it was employed by Rousseau in his famous declaration that it was the function of the state to maintain liberty and equality among its subjects (*Contrat Social*, ii, 11), and in the assertion of the American Declaration of Independence of the "self-evident" truth that all men are created equal. It was this kind of equality that, under the influence of Rousseau, the French Revolution aimed to realize, and the ideal to which it points has been the inspiration of more than one movement for the emancipation of humanity. How much the steady march of the democratic movement of the last century and the spread of popular government owe to this humanitarian sentiment for equality can only be imagined. It is in this extreme and sentimental form, also, that the doctrine has incurred the hostile criticism of hard-headed and unsympathetic writers such as Mr. Justice Stephen (*Liberty, Equality, and Fraternity*) and Sir Henry Maine (*Popular Government*). The influence of the doctrine in the communistic and socialistic movements of the day will be described in connection with those topics.

The term "equality" is somewhat more definitely employed in a secondary sense to denote one of the two great aims of the modern democratic movement in society and politics. One of these aims is individual liberty, and the other is such a measure of equality as is compatible with a rational liberty. The reconciliation of these two conflicting aims is the great task of government, and it is through this process of reconciliation that the conception of equality has been brought within the sphere of practical discussion. As a political programme, then, it includes the following definite aims: first, equality of political status; second, equality of civil rights; and third, equality of opportunity. The first of these is secured by the widest possible extension of the principle of popular government; the second by the abolition of privilege, whether based on wealth, on birth, or on public service; the third by breaking down the artificial barriers of caste, affording to all an equal enjoyment of public utilities and the advantages of a common education. Equality of political rights and equality before the law have been measurably attained in some favored lands, but industrial equality is still far to seek.

This principle of human equality is a purely modern conception and had its origin in the Christian conception of the equality of all men before God. It derived its impulse, as a social and political principle, mainly from the passionate writings of Jean Jacques Rousseau. See DEMOCRACY; LIBERTY OF THE INDIVIDUAL. Consult the authorities referred to under such titles as DEMOCRACY; POLITICAL SCIENCE, ETC.

EQUAL RIGHTS PARTY, THE. See LOCO-FOCO.

EQUATION (Lat. *æquatio*, from *æquare*, to equalize, from *æquus*, equal). In algebra, an equality which exists only for particular values of certain letters representing the *unknown quantities* is called an *equation*. These particular values are called the *roots* of the equation, and the determination of these roots is called the *solution* of the equation. Thus, $2x + 3 = 9$ is an equation, because the equality is true only for a particular value of the unknown quantity x , viz., for $x = 3$. The expression $2 + 5 = 7$ expresses an equality, but it is not an equation as the word is technically used in mathematics. Expressions like $(a + x)^2 = a^2 + 2ax + x^2$ are true for all values of the letters and are called *identities* to distinguish them from those equalities which are, in the stricter use of the term, known as equations. If an algebraic function $f(x)$ equals zero, and is arranged according to the descending, integral, positive powers of x , it has the form $f(x) = a_0x^n + a_1x^{n-1} + \dots + a_{n-1}x + a_n = 0$. Such an equation is called a complete equation of the n th degree with one unknown quantity; e.g., $a_0x^2 + a_1x + a_2 = 0$ is a complete equation of the second degree, while $a_0x^2 + a_2 = 0$ is an incomplete equation of the second degree. The letters $a_0, a_1, \dots, a_{n-1}, a_n$ stand for known quantities, and in the theory of equations, so called, they stand for *real* quantities. They are all coefficients of powers of x , except the *absolute term*, a_n , which may be considered the coefficient of x^0 . In case a_0, a_1, \dots, a_n are all expressed as numbers, the equation is said to be *numerical*; otherwise it is known as *literal*.

Equations may be classified as to the number of their unknown quantities. Those already mentioned involve a single unknown, but $x^2 + xy + y^2 = 0$ and $xy = 1$ involve two unknowns. There is no theoretical limit to the number of unknown quantities. Equations may also be classified as to degree, this being determined by the value of n in the complete equation already given. Thus,

$$\begin{aligned} & a_0x + a_1 = 0 \\ & a_0x^2 + a_1x + a_2 = 0 \\ & a_0x^3 + a_1x^2 + a_2x + a_3 = 0 \\ & a_0x^4 + a_1x^3 + a_2x^2 + a_3x + a_4 = 0 \end{aligned}$$

are equations respectively of the first degree (simple or linear equation), of the second degree (quadratic equation), of the third degree (cubic equation), and of the fourth degree (quartic or biquadratic equation).

If two or more equations are satisfied by the same value of the unknown quantities, they are said to be *simultaneous*, as in the case of $x^2 + y = 7$, $x + y^2 = 11$, where $x = 2$, $y = 3$; but $x^2 + y = 7$ and $3x^2 + 3y = 9$ are not simultaneous; they are *inconsistent*, there being no values of x and y that will satisfy both; and $x^2 + y = 7$ and $3x^2 + 3y = 21$ are said to be *identical*, each being derivable from the other. In case there is not a sufficient number of relations given to enable the roots of an equation to be determined, exactly or approximately, the equation is said to be *indeterminate*; e.g., in the equation $x + 2y = 10$, any of the following pairs of values satisfies the equation: (0, 5), (1, 4.5), (2, 4), (3, 3.5), ..., (10, 0), (11, -0.5), In general, n linear equations, each containing $n + 1$ or more unknown quantities, are indeterminate. Thus, $2x + 3y + z = 10$, $3x + 2y + z = 8$, give rise to the simple equation $-x + y = 2$,

which is indeterminate. Equations may also be classified as *rational*, *irrational*, *integral*, or *fractional*, according as the two members, when like terms are united, are composed of expressions which are rational, irrational (or partly so), integral, or fractional (or partly so), respectively, *with respect to the unknown quantities*; e.g.:

$3x + \sqrt{5} = 0$ is a rational integral equation,

$6 + \sqrt[3]{x} = 0$ is an irrational integral equation,

$\frac{2}{x} + \sqrt{14} = 0$ is a rational fractional equation,

$(x+3)^{-\frac{1}{2}} = 5$ is an irrational fractional equation.

Algebra is chiefly concerned with the solution of equations, and definite methods have been devised for determining the roots of algebraic equations of the first, second, third, and fourth degrees. Equations of the first degree are solved by applying the common axioms: if equals are added to equals, the results are equal; if equals are subtracted from equals, the results are equal; and the corresponding axioms of multiplication and division. Equations of the second degree may be solved by reducing the quadratic function to the product of two linear factors, thus making the solution of the quadratic equation depend upon that of two linear equations.

Thus, $x^2 + px + q = 0$ reduces to

$$(x + \frac{p}{2} + \frac{1}{2}\sqrt{p^2-4q})(x + \frac{p}{2} - \frac{1}{2}\sqrt{p^2-4q}) = 0,$$

whence

$$x + \frac{p}{2} \pm \frac{1}{2}\sqrt{p^2-4q} = 0, \text{ and } x = -\frac{p}{2} \pm \frac{1}{2}\sqrt{p^2-4q}.$$

Similarly the solution of the cubic equation is made to depend upon that of the quadratic equation, and that of the biquadratic equation upon that of the cubic equation. These formulas, however, when applied to numerical equations, often involve operations upon complex numbers not readily performed and hence are of little value in such cases; e.g., in applying the general formula for the roots of the cubic equation, the cube root of a complex number is often required, in which case the methods of trigonometry are employed. The real roots of numerical equations of any degree may be calculated approximately by the methods of Newton, Lagrange, and Horner, the last being a rediscovery of an old Chinese method and being the one generally preferred.

Equations of the first degree were familiar to the Egyptians in the time of Ahmes (q.v.), since a papyrus transcribed by him contains an equation in the following form: Mass (*hau*), its $\frac{2}{3}$, its $\frac{1}{2}$, its $\frac{1}{3}$, its whole, gives 37; i.e.,

$$\frac{2}{3}x + \frac{1}{2}x + \frac{1}{3}x + x = 37.$$

The ancient Greeks knew little of linear equations except through proportion, but they treated in geometric form many quadratic and cubic equations. (See CUBE.) Diophantus (c.275 A.D.), however, distinguished the coefficients ($\pi\lambda\eta\theta\sigma$) of the unknown quantity, gave the equation a symbolic form, classified equations, and gave definite rules for reducing them to their simplest forms. His work was chiefly concerned with indeterminate systems of equations, and his method of treatment is known as Diophantine analysis (q.v.).

The Egyptian mathematicians were acquainted with problems which we would solve by quad-

raties. The Petrie papyrus (published in 1897) and the Berlin papyrus (No. 6619) both contain such problems. One pair of equations, expressed in modern form, is as follows:

$$x^2 + y^2 = 100$$

$$x : y = 1 : \frac{3}{4}.$$

The Greeks of the time of Euclid could solve a quadratic equation geometrically, and Diophantus could do so with some approach to the symbolic methods.

The Chinese likewise solved quadratic equations geometrically, and Sun Tse (third century), like Diophantus, developed a method of solving linear indeterminate equations. The Hindus advanced the knowledge of the Greeks. Bhaskara (twelfth century) used only one type of quadratic equation, $ax^2 + bx + c = 0$, considered both signs of the square root, and distinguished the surd values, while the Greeks accepted only positive integers. The Arabs improved the methods of their predecessors. They developed quite an elaborate system of symbolism. The equations of Al Kalsadi (fifteenth century) are models of brevity, and this plan for solving linear equations, a modified Hindu method, was what was later known as the *regula falsi*. See FALSE POSITION.

The Europeans of the Middle Ages made little advance in the solving of equations until the discovery by Ferro, Tartaglia, and Cardan (sixteenth century) of the general solution of the cubic equation. The solution of the biquadratic equation soon followed, and the general quintic was attacked. But, although much was done to advance the general theory of the equation by Vandermonde, Euler, Lagrange, Dézout, Waring, Malfatti, and others, it was not until the beginning of the nineteenth century that equations of a degree higher than the fourth received satisfactory treatment. Ruffini and Abel were the first to demonstrate that the solution, by algebraic methods, of a general equation of a degree higher than the fourth is impossible, and to direct investigation into new channels. Mathematicians now sought to classify equations which could be solved algebraically and to discover higher methods for those which could not. Gauss solved the cyclotomic group, Abel the group known as the Abelian equations, and Galois stated the necessary and sufficient condition for the algebraic solubility of any equation as follows: If the degree of an irreducible equation is a prime number, the equation is soluble by radicals alone, provided the roots of this equation can be expressed rationally in terms of any two of them. As to higher methods, Tschirnhausen, Bring, and Hermite have shown that the general equation of the fifth degree can be put in the form $t^5 - t - A = 0$; Hermite and Kronecker solved the equation of the fifth degree by elliptic functions and Klein has given the simplest solution by transcendental functions.

A few of the more important properties of equations are: 1. If r is a root of the equation $f(x) = 0$, then $x - r$ is a factor of $f(x)$; e.g., 2 being a root of $x^2 + 2x - 8 = 0$, then $x - 2$ is a factor of $x^2 + 2x - 8$.

2. If $f(x)$ is divisible by $x - r$, r is a root of $f(x) = 0$; e.g., in $(x - 2)(x^2 + x + 1) = 0$, $x - 2$ is a factor, hence $x - 2 = 0$ satisfies the equation, and $x = 2$.

3. Every equation of the n th degree has n roots and no more (the fundamental theorem of

equations due to Harriot, or, in its complete form, to D'Alembert): e.g., $x^4 - 1 = 0$ has four roots, $x = 1, -1, i, -i$, and no more.

4. The coefficients of an equation are functions of its roots. Thus, in

$$x^n + a_1 x^{n-1} + a_2 x^{n-2} + \dots + a_n = 0,$$

if r_1, r_2, \dots, r_n are the roots, then

$$a_1 = -(r_1 + r_2 + \dots + r_n), a_2 = r_1 r_2 + r_1 r_3 + \dots + r_{n-1} r_n, a_3 = -(r_1 r_2 r_3 + r_1 r_2 r_4 + \dots + r_{n-2} r_{n-1} r_n) \dots a_n = r_1 r_2 \dots r_n.$$

5. The number of positive roots of $f(x) = 0$ does not exceed the number of changes of signs in $f(x)$. (Descartes's rule of signs.) For instance, in $x^4 - 3x^3 - 2x^2 + x - 1 = 0$ there are 3 changes of signs, hence there can be no more than 3 positive roots.

6. The special functions associated with the roots of an equation which serve to distinguish the nature of these roots are called *discriminants*; e.g., the general form of the roots of the quadratic equation, $x^2 + px + q = 0$, may be taken as

$$x = -\frac{p}{2} \pm \frac{1}{2} \sqrt{p^2 - 4q}.$$

The expression

$$p^2 - 4q$$

is the discriminant, for, if $4q > p^2$, the roots are complex; if $4q = p^2$, the roots are real and equal; if $4q < p^2$, the roots are real and unequal; and if $p^2 - 4q$ is a perfect square, the roots are rational. Similarly the discriminant of the cubic $x^3 + 3hx + g = 0$ is

$$g^2 + 4h^3.$$

The discriminants of equations of higher degree are fully explained in works on the theory of equations.

A *differential equation* is an equation involving differential coefficients (see CALCULUS); e.g.,

$$\frac{dy}{dx} + a \frac{dy}{dx} = x,$$

from which it is required to find the relation between y and x . The theory of the solution of such equations is an extension of the integral calculus and is a branch of study of the highest importance.

For the general theory of equations, consult: Dickson, *Introduction to the Theory of Algebraic Equations* (New York, 1903); Burnside and Panton, *Theory of Equations* (4th ed., London, 1899-1901), the appendix to which contains valuable historical material; Petersen, *Théorie des équations algébriques* (trans. by Laurent, Paris, 1897); Salmon, *Lessons Introductory to Modern Higher Algebra* (Dublin, 1859, and subsequent eds.); Serret, *Cours d'algèbre supérieure* (3d ed., Paris, 1866); Jordan, *Traité des substitutions et des équations algébriques* (ib., 1870). An extensive work, covering both history and method, is Matthiessen, *Grundzüge der antiken und modernen Algebra der literalen Gleichungen* (Leipzig, 1896).

EQUATION, ANNUAL. One of the most conspicuous of the subordinate fluctuations in the moon's motion, due to the action of the sun. It consists in an alternate increase and decrease in the moon's longitude, corresponding with the earth's situation in its annual orbit, i.e., to its angular distance from perihelion, and therefore it has a year instead of a month, or aliquot part of a month, for its period. See LUNAR THEORY.

EQUATION, CHEMICAL. See CHEMISTRY.

EQUATION, PERSONAL. A very important factor in astronomical or other scientific observations. Two observers, each of admitted skill, often differ in their record of the same event—as the passage of a star before the wires of a transit instrument—by a quantity nearly the same for all observations by those persons. This quantity is their relative personal equation. Each observer habitually notes the time too early or too late, by a small and nearly uniform portion of a second. This quantity is his absolute personal equation. Machines have been invented for determining the amount of personal equation by reproducing artificially the kind of observation usually affected with this form of error in actual work on the sky. The so-called Repsold apparatus is a mechanical device which so changes the condition of observation with a transit instrument or meridian circle that the personal equation is removed altogether, and its quantitative evaluation is rendered unnecessary.

EQUATION OF LIGHT. In astronomical observations, the ray of light by which we see any celestial body is not that which it emits at the moment we look at it, but which it did emit some time before, viz., the time occupied by light in traversing the space which separates us from the celestial body. The quantity of time so required for the passage of light from the sun to the earth is the so-called light equation. It amounts to about 8 minutes, 20 seconds.

EQUATION OF PAYMENTS. A method of finding the time when, if a sum of money is paid all at once by a debtor, instead of several debts payable by him at different times, no loss will be sustained by either the debtor or creditor. The common rule is: Multiply each debt by its term of credit, and divide the sum of the products by the sum of the debts. The quotient will be the average term of credit. This added to the date from which the credits were reckoned will give the average time of payments; e.g., to find the average time of paying \$200 due April 1, \$200 due May 11, and \$400 due June 30: $\$200 + 40 \times \$200 + 90 \times \$400 = \$44,200$; $\$44,200 \div \$800 = 55$. April 1 + 55 days = May 26, the equated time. This method is incorrect, except for equal debts, because it takes no account of the balance of interest and discount. It is, however, sufficiently accurate for ordinary use.

EQUATION OF THE CENTRE. A term used by astronomers in connection with the planets' orbital motions. The anomaly (q.v.) of a planet does not increase uniformly after perihelion passage, because, according to Kepler's law, a line joining the planet with the sun sweeps over equal areas (not equal angles) in equal times. The angle by which the true anomaly exceeds the mean anomaly is called the equation of the centre.

EQUATION OF THE EQUINOXES. The difference between the actual position of the equinoxes (q.v.) and the position calculated on the assumption that their motion is uniform. See PRECESSION.

EQUATION OF TIME. The amount which must be added to the apparent time to obtain the mean time; in other words, the mean time of apparent or true noon. The sun's motion in the ecliptic is not uniform. This want of uniformity would of itself be sufficient to cause

an irregularity in the intervals of time between successive returns of the sun to the meridian, day after day; but besides this want of uniformity in the sun's apparent motion in the ecliptic, there is another cause of inequality in the time of his coming to the meridian, the obliquity of the ecliptic to the equinoctial. These two independent causes conjointly produce the inequality in the time of his appearance on the meridian, the correction for which is the equation of time. The equation of time varies from day to day and is to be found tabulated in astronomical almanacs, such as the *Nautical Almanac*, under the heading "Sun before clock" or "Sun after clock." It is zero at four different times in the year, when the mean and unequal motions exactly agree—viz., about April 15, June 15, August 31, and December 24; on account of leap year, these dates may vary by a day. From December 24 to April 15 and from June 15 to August 31, the equation of time is positive, i.e., the sun is slow or "after the clock," the maximum amounts being 14 minutes, 28 seconds on February 11, and 6 minutes, 17 seconds on July 26; during the remaining portions of the year the equation of time is negative, and the sun is fast, or "before the clock," the maximum amounts being 3 minutes, 49 seconds on May 14, and 16 minutes, 21 seconds on November 3.

EQUATOR, CELESTIAL (ML. *aequator*, equalizer, from Lat. *aquare*, to equalize). The great circle which would be cut out on the sky by extending the plane of the earth's equator.

EQUATOR, TERRESTRIAL. The great circle on the earth's surface, halfway between the poles, which divides the earth into the Northern and Southern hemispheres.

EQUATORIAL (from ML. *aequator*, equalizer). A term applied in astronomy to a method of mounting astronomical telescopes, by which a celestial body may be observed at any point of its diurnal course. It consists of a telescope fastened to a graduated circle, called the declination circle, whose axis is attached at right angles to that of another graduated circle called the hour circle and is wholly supported by it. The hour-circle axis, which is called the principal axis of the instrument, turns on fixed supports; it is pointed to the pole of the heavens, and the hour circle is of course parallel to the equinoctial. This combination of axes gives us a universal joint, thus enabling us to point the tube at any star in the sky; and with the pair of circles we can measure and record the exact position in the sky of the star under observation. On account of one axis being pointed at the pole, about which all the stars revolve in their diurnal course, it becomes possible to follow their motions by rotating the telescope about this one axis only, and this rotation can be effected easily and conveniently with clockwork. See TELESCOPE.

EQUESTRIAN ORDER (Lat. *ordo equester*), or **EQUITES** (Lat., horsemen, knights, from *equus*, horse). Originally the cavalry of the Roman army. Romulus, it is said, selected from the three principal Roman tribes a cavalry bodyguard of 300, called *celerēs*. By the constitution of Servius Tullius 18 centuries (see COMITIA) of equites were created. (See *ROME, History of Rome during the Earliest or Regal Period*.) The number was afterward gradually increased to 1800, who were partly of patrician and partly of plebeian rank and were required

to possess a certain amount of property (400,000 sesterii, about \$17,000). Each of these equites received a horse from the state and another for his groom, together with an allotment for the keep of the horses; such horsemen were known as *equites equo publico*, horsemen or knights with a state horse; but about 403 B.C. a new body of equites began to make their appearance, composed of wealthy citizens who furnished a horse at their own expense (*equites equo privato*). The equites were reviewed by the *censors* (see CENSOR); equites who failed to meet the tests of physique and character were dropped from the rolls. Until 123 B.C., the equites were exclusively a military body, but in that year Caius Gracchus carried a measure by which all the *judices* (jurors) had to be selected from them. Now, for the first time, they became a distinct order or class in the state, nonmilitary in character, and were called *ordo equester*. Sulla deprived them of this privilege; but their power did not then decrease, as the farming of the public revenues appears to have fallen into their hands. (See PUBLICANI.) They became the money aristocracy of Rome. To the title of *Senatus populusque Romanus* was added *et ordo equester*. As their insignia, the equites wore a gold ring and the *angusticlavus* (the tunic with two narrow crimson stripes down the front). From the time of Augustus the *ordo equester* became again military in character.

From these equites the higher officers of the army were chosen. To fit him for high command, each eques was required to pass through a definite sequence of offices, known as the *equester cursus honorum*. From the equites, too, certain magistrates were chosen. Hence admission to the equites constituted, in effect, an introduction to public life. Consult Egbert, *Introduction to the Study of Latin Inscriptions* (New York, 1896). On the equites in general, consult article "Equites" in Smith, *A Dictionary of Greek and Roman Antiquities* (3d ed., London, 1890); Greenidge, *A History of Rome*, vol. i (ib., 1905); the article "Equites Romani," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vi (Stuttgart, 1909).

EQUESTRIAN STATUE. The representation in sculpture of a person on horseback. Equestrian statues were not commonly erected in Greece, but in Rome they were often awarded as a high honor to military commanders and persons of distinction, and latterly were, for the most part, restricted to the emperors, the most famous in existence being that of the Emperor Marcus Aurelius, which now stands in the piazza of the Capitol at Rome. It is the only ancient equestrian statue in bronze that has been preserved. They were not erected during the Middle Ages, except at the close of the epoch when stone equestrian statues of St. George and St. Martin were carved, especially in France. From the same period are the three remarkable Della Scala monuments at Verona. The first bronze equestrian statue of the Renaissance, and therefore of modern art, was that of Gattamelata by Donatello at Padua, and the finest that of Bartolommeo Colleoni by Verrocchio in Venice—probably the grandest equestrian statue in existence. Characteristic examples of equestrian statues during the baroque period are: "The Great Elector" by Andreas Schlüter in Berlin, Louis XI by Petitot in

1. AFRICAN WILD-ASS (*Equus asinus*).
2. TRUE, OR MOUNTAIN ZEBRA (*Equus zebra*).
3. KIANG, OR ASIATIC WILD-ASS (*Equus hemionus*).

4. QUAGGA (*Equus quagga*); extinct.
5. MUSTANG OF SOUTHWESTERN UNITED STATES.
6. BURCHELL'S ZEBRA (*Equus Burchelli*).

Versailles, Peter the Great by Falconet in St. Petersburg. During the nineteenth century bronze equestrian statues were indefinitely multiplied to such an extent that few important cities in Europe or America are without one or more examples. According to statistics gathered in 1913 there are about 630 in the world, 89 of which are in the United States. Paris leads with 25, including the statue of Joan of Arc by Fremiet, Lafayette by Paul Bartlett, and Washington by Daniel Chester French and Potter. Berlin has 14, including Frederick the Great (for illustration see the Plate with article RAUCH) by Christian Rauch—one of the very finest of modern times—and William I by Reinhold Begas. Other prominent European examples are: Maximilian I by Thorvaldsen at Munich; the four equestrian statues of the Maria Theresa monument by Zumbusch; and Alexander III by Troubetskoy at St. Petersburg. Among the finest recent examples in England are Hugh Lupus by G. F. Watts (Chester) and the Duke of Wellington (in St. Paul's Cathedral) by Alfred Stevens.

The first equestrian statue in the United States was that of General Jackson in Washington, designed and cast by Clarke Mills in 1853 (replicas in Nashville and New Orleans); the second was the well-known "Washington" by H. K. Brown in New York—still one of the most notable in the country. There is an especially large number at Washington (12 in 1913), including General Thomas by J. Q. A. Ward, General McClellan by MacMonnies, and General Sheridan by Gutzon Borglum; an equal number in Philadelphia, particularly in connection with the Richard Smith Memorial, Fairmount Park. Boston also possesses several good examples, including those of Washington by Thomas Ball, Colonel Shaw by Saint-Gaudens, and General Hooker by D. C. French and E. C. Potter. Chicago also has good examples. Among other notable equestrian statues in the United States are those of General Sherman by Saint-Gaudens in New York, General Slocum by MacMonnies in Brooklyn, N. Y., Robert E. Lee by Mercier in Richmond, Va., and the Volunteer Monument by Douglas Tilden in San Francisco. Some of the battlefields of the Civil War, particularly Gettysburg, have been transformed into parks and contain a number of equestrian statues. Consult Quimby, *The Equestrian Monuments of the World* (New York, 1903).

E'QUIAN'GULAR (from Lat. *æquus*, equal + *angulus*, angle). A figure is said to be equiangular if all of its angles are equal, as is the case with the angles of a square or a regular polygon. Triangles which are mutually equiangular are called similar; but other mutually equiangular polygons are not similar unless their corresponding sides are proportional. (See SIMILARITY.) A polyhedron is equiangular when all its polyhedral angles are equal, as is the case with the angles of a cube. A spiral (q.v.) is called equiangular when the angle included between any radius vector and the tangent at its extremity is the same in all cases. This is the characteristic property of the logarithmic spiral.

EQUIDÆ (Neo-Lat. nom. pl., from *equus*, horse), or **SOLDUNGULA**. The horses, a family of hoofed mammals of the suborder Perissodactyla, containing only a small number of species, which so nearly resemble each other that most zoologists agree in referring them to

one genus, *Equus*, though some have put the asses in the separate genus *Asinus*. They are distinguished from other quadrupeds by the concentration of the foot and toes, or the extraordinary development of the middle toe, which thus carries the whole weight and is incased in a bootlike hoof. There are, however, two small protuberances ("splint" bones) on each side of both the metacarpal and metatarsal, or "cannon" bones, which represent the former existence of other toes. The Equidæ have six incisors in each jaw, and six molars on each side in each jaw; the males have also two small canine teeth in the upper jaw, sometimes in both jaws, which are almost always wanting in the females. The molars of the Equidæ have square crowns, and are marked by the lamina of enamel with ridges forming four crescents. The wearing down of these develops different patterns at different ages, by the examination of which, in the incisors, a person may determine with considerable accuracy the age of a horse. (See Plate illustrating this under HORSE.) There is a wide space between the canine teeth and the molars. The stomach of the Equidæ is simple, but the intestines are long, and the cæcum extremely large; the digestive organs thus exhibiting an adaptation, very different from those of the ruminants, to the same kind of not easily assimilated food. Another distinctive peculiarity of the Equidæ is that the females have two teats situated on the pubes, between the thighs. The Equidæ are now found in a truly wild state only in Asia and Africa. Fossil remains exist in the newer geological formations in great abundance in many parts of both the Old World and the New; and the whole evolutionary history of the Equidæ has been admirably worked out. (See HORSE, FOSSIL.) The horse and the ass are by far the most important species of this family. The quagga is extinct. The zebra seems incapable of useful domestication. Some attempts have been made, however, to cross zebras with horses in the hope that the hybrid might be able to withstand the attacks of the tsetse fly (q.v.) in South Africa; but though the hybrids are easily obtained and seem hardy, they cannot survive the bites of that terrible scourge. See ASS; HORSE; MULE; QUAGGA; ZEBRA.

E'QUILIBRIUM, **MECHANICAL** (Lat. *æquilibrium*, level position, from *æquus*, equal + *libra*, balance). The condition of a body or of a system of bodies when there is no change in its motion; i.e., there is no acceleration of any kind, either of translation or of rotation. The mathematical conditions are, therefore, that the resultant force in any direction is zero, and that the resultant moment of the forces around any axis is zero. Equilibrium is called stable, unstable, or neutral, depending upon the consequence of giving the body or system of bodies a small impulse; if the change which results from this impulse is decreased by the forces called into action by the motion, the equilibrium is stable; if it increases, the equilibrium is unstable; if it remains unchanged, it is neutral. Thus, a body suspended at rest by a string is in stable equilibrium; a knife balanced on its point is in unstable equilibrium; a sphere lying on a smooth horizontal table is in neutral equilibrium. The use of the word "equilibrium" is extended also so as to include the condition of no apparent change in many other cases. A liquid is in equilibrium with its vapor if there is no

longer any apparent evaporation or condensation. Thermal equilibrium is the condition when there is no longer any change in temperature. See MECHANICS.

EQUIMULTIPLE. See MULTIPLE.

EQUINE ANTELOPE. A book name for either the roan or the sable antelope (qq.v.). See BLAUROK, and Plate of ANTELOPES.

EQUINIA. See GLANDERS.

EQUINOCTIAL (Lat. *æquinoctialis*, from *æquinoctium*, equinox, from *æquus*, equal + *nox*, night). The celestial equator. (See EQUATOR, CELESTIAL.) The equinoctial points are those in which the equinoctial and the ecliptic intersect. See ECLIPTIC.

EQUINOCTIAL STORM, or GALE. For at least 300 years past, whenever a severe storm occurs on the Atlantic coast of North America or Great Britain at the season of the equinox, either autumnal or vernal, it has been spoken of as "the equinoctial storm" or gale, and there has sprung up a popular belief that such a severe storm is due at or near the date of the equinox. The fact is, however, that the stormy season of the year over the North Atlantic begins with August and continues with increasing severity until March or April, and there is no special day or period more likely than another to be stormy. Of course numerous severe storms are recorded near these dates, such as those of Sept. 20, 1676; Oct. 20, 1770; Sept. 23, 1815; Oct. 2, 1841; Oct. 7, 1849, and Sept. 8, 1869, all of them along the American coast; but it will be noticed that these dates have no close connection with the equinoctial date—September 22—and there are not more than a dozen such in the course of 200 years. The equinoctial storm is therefore simply a name given to the heaviest storm that happens to occur within a few weeks of the date of the equinox. For statistical details, consult: *Quarterly Journal Royal Meteorological Society* (London, 1884); *United States Monthly Weather Review* (Washington, 1891-1914); Loomis, *Treatise on Meteorology* (New York, 1871, last ed. 1883).

EQUINOXES. Sometimes the equinoctial points (see EQUINOCTIAL) are called the equinoxes. More commonly, by the equinoxes are meant the times when the sun passes those points, viz., March 21 and September 22, the former being called the vernal or spring equinox, and the latter the autumnal. When the sun is in the equinoxes, the days and nights are of equal length all over the world. At the vernal equinox the sun is passing from south to north, and in the Northern Hemisphere the days are lengthening; at the autumnal, he is passing from north to south, and the days are shortening. As the earth moves more rapidly when near the sun, or in winter, the sun's apparent motion is not uniform, and it happens that he takes longer to pass from the vernal to the autumnal equinox than from the latter to the former. The equinoctial points are not stationary, on account of precession (q.v.). See ECLIPTIC.

EQUIPOLLENT (Lat. *æquipollens*, from *æquus*, equal + *pollere*, to have power). A term which, applied to lines, signifies equal in length and parallel in direction. There is a special geometry of such lines called the geometry of equipollence. This term was used in algebra by Chuquet (1484) to designate equivalent expressions.

EQUISETACEÆ and EQUISETALES. See EQUISETUM.

EQUISETUM (Neo-Lat., from Lat. *equisetum*, *equisætis*, *equiseta*, from *æquus*, horse + *seta*, bristle), HORSE-TAIL, RUSS, or SCORING RUSS. The only living genus of the order Equisetales. This order is one of the great divisions of the Pteridophytes, the most conspicuous of the other orders being the ferns (Filicales) and the club mosses (Lycopodiales). The genus *Equisetum* is represented in the living flora by about 25 species, which are the lingering remnants of an extensive display that was a conspicuous feature of the flora of the Carboniferous and Mesozoic. The living forms are mostly small and inconspicuous, but they are very characteristic in appearance. The stem is slender and conspicuously jointed, the joints separating easily; it is also grooved and fluted by small longitudinal ridges, and there is such an abundant deposit of silica in the epidermis that the plants feel rough. At each joint there is a sheath of minute leaves, the individual leaves sometimes being indicated only by minute teeth. Since these leaves contain no chlorophyll and evidently do not function as foliage leaves, the chlorophyll work is carried on by the green stem, which is either simple or profusely branched.

One of the distinguishing features of the group is that they have distinct, spore-bearing leaves (sporophylls), and that these are arranged so as to form a conelike cluster, or strobilus. Each sporophyll in the strobilus consists of a stalklike portion bearing a peltate expansion. Beneath this shieldlike expansion hang the spore cases (sporangia), usually ranging from 5 to 10 in number. The spores produced are all alike, so that the group is not one of those in which heterospory (q.v.) occurs at present, although it is suspected that some of the ancient members of the group were heterosporous. The spores have a very interesting structure. In addition to the two coats common to spores, there is a third outer one consisting of two intersecting spiral bands which are attached to the spore only at their point of intersection. On drying, the spiral bands loosen and become uncoiled, and when moistened they close again around the spore. By means of these movements they serve to hook together the spores, and in this way the close proximity of germinating spores is secured. The significance of this proximity lies in the fact that the sexual plants (gametophytes) which the spores produce are unisexual—i.e., one plant produces the male organs (antheridia), and another produces the female organs (archegonia), a condition called diœcism (q.v.).

Fossil Forms. Fossil remains of Equisetales are found abundantly throughout the Paleozoic and Mesozoic of all countries. During the Paleozoic, in both the Devonian and Carboniferous, there occurred a great plexus of *Equisetum*-like forms, the whole assemblage being known in general as the Calamites. These forms are known mostly from pith casts, and all of them show the peculiar habit of *Equisetum*, with its jointed and fluted stem and whorled leaves. Among this plexus of forms the ancestors of *Equisetum* occur. An interesting feature of many of the Paleozoic Equisetales is that the leaves were large and functional, so that the Equisetums of to-day represent forms whose leaves have lost their ordinary function. There are also numerous detached cones (strobili) belonging to the Equisetales. Many of the Paleozoic forms were

huge trees, sometimes reaching a height of at least 100 feet, the Calamites thus representing a conspicuous feature of the forest vegetation of the Paleozoic. During the Mesozoic the order was also well represented by forms intermediate between the Paleozoic Calamites and the modern *Equisetum*. For illustration, see Plate of *PTERIDOPHYTES*. Consult: Solms-Laubach, *Fossil Botany* (Oxford, 1891); Zittel, Schimper, and Barrois, "Traité de paléontologie," part ii, *Paléophytologie* (Paris, Munich, and Leipzig, 1891); Scott, *Studies in Fossil Botany* (London, 1909).

EQUITABLE ASSETS. Property of a debtor or decedent which cannot be reached by legal process, but which will be applied by equity to the payment of debts. Originally only property held by the debtor or his personal representative by a legal title was applicable to this purpose, and in the earliest period of our legal history the rights of creditors were confined to the personal property so held. Subsequently a testator might, by charging his real estate with the payment of his debts, or by directing his executor to sell his lands for that purpose, render such property liable in equity to the claims of his creditors. This did not have the effect of merging them in his general assets and of subjecting them to legal process; but it made them equitable assets, subject to the order of the Court of Chancery. This distinction has now been swept away in England and in the United States by statute. See DECEDENT.

The expression "equitable assets" is now applied to any equitable property rights of a debtor which can be reached by creditors only by a proceeding in equity. Most equitable interests—though there are some important exceptions—have been subjected by statute to the claims of creditors; but it is manifest that such an interest—as the rights of a beneficiary of a trust, e.g.—cannot be reached by the ordinary legal process of an execution or attachment. The creditor has resort, therefore, to a proceeding in equity known as a "creditor's bill." In a few American jurisdictions a statutory process has been devised for enforcing creditors' rights against either or both forms of property without distinction. See ASSETS; EQUITY; EQUITABLE ESTATE.

EQUITABLE ASSIGNMENT. A transfer of the beneficial interest in property, real or personal, or of a claim or demand, the legal title to which remains vested in the transferor. It is effected by any transaction, as a defective legal assignment or even a mere agreement, whereby the owner of such property seeks to assign his interest therein to another, and it may operate even to vest in another the substantial control over property which is not assignable under the technical rules of the common law. The equitable mortgage (q.v.) is an illustration of the former, and the transfer of a right of action is a characteristic example of the latter.

A formal deed is necessary to the creation or legal transfer of an interest in land, and in the absence of a bill of sale a delivery of a chattel is requisite to vest the title thereto in the transferee; but the courts of equity will protect the interests of such a grantee who has parted with a valuable consideration in reliance upon it, even where the strict legal formalities have been omitted. This it does by compelling

the execution of a valid conveyance or by vesting in the grantee the rights of an owner. In the same way the attempted transfer of property not at the time in existence, or not yet acquired by the vendor or mortgagor, is regarded in equity as a valid assignment of the transferor's future interest therein, which becomes complete upon his subsequent acquisition of the title. See ESTOPPEL.

Equity will also interfere to protect the assignee of a chose in action (q.v.) and permit him to prosecute the action for his own benefit, but in the name of his assignor, who at common law was still considered the owner of the claim and the rightful party in interest. This awkward device for securing the assignability of rights of action is still employed in many of the United States, though it has in others been rendered unnecessary by statutory provisions rendering such rights freely assignable at law.

An equitable assignee takes the assigned property as it is, subject to all claims, set-offs, or liens, whether legal or equitable, to which it is subject at the time of the transfer. See EQUITY; EQUITABLE ESTATE.

EQUITABLE DEFENSE. A defense in an action or legal proceeding which is cognizable by a court of equity, as distinguished from a court of law. Thus, in an action on a promissory note, the defense of want of consideration is a *legal defense*, as tending to relieve the maker thereof from his liability on the contract; but the defense of fraud, being an allegation of extraneous matter, did not affect the legal liability, but was an *equitable defense* and involved an appeal to equity jurisdiction. Under the old practice, by which the limits of common-law and equity jurisdiction were strictly defined, equitable defenses were not available in a court of common law. As early as 1854 in England it was enacted that such defenses might in many cases be pleaded in a court of common law, and such pleading did not debar the defendant from afterward applying for appropriate relief to a court of equity. The same permission is given by the codes and procedure acts in most of the American States. With very few exceptions, what were formerly equitable defenses may now be put forward, both in the United States and in England, in the same action and simultaneously with strictly legal defenses. See EQUITY; PROCEDURE.

EQUITABLE EASEMENT. A right to control or restrict another, by injunction or other equitable process, in the lawful use of his land. This right arises under a variety of circumstances, but usually where the owner of a parcel of land enters into a restrictive covenant as to his use thereof with a neighbor—as that he will not build within a certain distance of the street line; that he will not maintain a stable, a tavern, or other objectionable occupation thereon. Such a covenant is enforceable at law against the maker of it; but as no burden can be imposed upon land by covenant, and as such a restriction cannot, however created, be recognized as a legal easement, it becomes inoperative as soon as the land is conveyed away by the covenantor to a stranger. If, however, the covenantor bound his heirs and assigns, as well as himself, to the performance of the agreement, the courts of equity will restrain a violation of it, not only by the covenantor himself, but by his heir, his devisee, or grantee without consideration, and by any assign who takes the land

with knowledge of the covenant. As in the United States the recording of a deed is constructive notice of its contents to all subsequent purchasers of the property, this equity jurisdiction creates in this class of cases a right analogous to that known as an easement at law. The phrase "restricted land" and "restrictive covenants," in common use in connection with city and suburban property, have reference to the existence of such equitable easements.

Though the exercise of this jurisdiction is closely limited to agreements which are of a restrictive character and which impose no active duty upon the owner of the land affected, it has in recent years been greatly expanded so as to include cases in which there was in fact no covenant, but only a general, but perfectly clear and definite, understanding among the various owners of a tract of land as to the uses to which it should be devoted. Accordingly, if land is subdivided and sold in parcels in accordance with a general scheme or plan, all who buy with notice of the restrictions contained in such plan are bound thereby. See COVENANT; EASEMENT; EQUITY; RESTRICTIVE COVENANT.

EQUITABLE ESTATE. An interest in property of such a nature that its enforcement and protection are within the jurisdiction of the courts of equity and not of common law: the right to the beneficial use and enjoyment of property without the legal estate. It is only by a considerable extension of the technical meaning of the term "estate" and by analogy that it can be applied to a right of this character. In the primary classification of legal rights as rights in rem and rights in personam—i.e., rights in a definite object (in rem certam) available against the whole world, and rights available against a particular individual only—property rights form by far the largest, if not the most important, body of rights of the former class. A freehold estate in lands, e.g., is not, like a claim founded upon contract, a right against a certain, definite person, but involves the assertion of an exclusive title and right of possession against any and everybody who may choose to dispute it. Such rights as these are fully recognized and protected by the courts of common law, by putting the rightful claimant in possession of the property and by defending such possession against all comers, and they are thus appropriately described as legal estates.

The corresponding equitable right, on the other hand, is not, in our legal system, a right in rem, but only in personam. The beneficiary of the right cannot claim the possession of the property to which it relates, and a trespass upon it is not an injury to him, but to the trustee or other person in whom the right in rem, the legal title, is vested. The remedy of the beneficiary is confined to the latter, in personam, whose administration of such legal estate he is entitled to supervise and control. Clearly such a right as this lacks the character of property, or of an estate, in the strict sense of those terms. But the expressions "equitable estate" and "equitable property" have been found too convenient to be dismissed on technical grounds and must now be regarded as permanent additions to our legal nomenclature; in addition to which, the recent fusion of law and equity jurisdiction in England and many of the United States has tended to make the distinction between legal and equitable interests less important.

The origin of equitable estates is to be found

in the ancient practice of conveying lands to the use of a person other than the grantee, which prevailed in England in the fifteenth and sixteenth centuries. By the Statute of Uses, enacted in the twenty-seventh year of Henry VIII (1535), this practice, which had become so general as to involve most of the lands in the kingdom, was much curtailed, and the system of trusts, as we know them, established. These constitute at the present time by far the greater part of the class of interests known as equitable estates. Rights of an analogous character arise under a great variety of circumstances. Whenever one person has the legal title to property, real or personal, and another is entitled by the aid of equity to compel the conveyance of the property to himself or its administration for his benefit, the latter has an equitable estate therein.

Such a right arises in every case where an unexecuted agreement exists for the conveyance or mortgaging of land, or where an attempt to make such a conveyance or mortgage fails through the defective execution of the instrument of assignment. The right to the specific performance of the contract in the one case, and to compel the due execution of the instruments in the other, whereby the legal title to the property shall be transferred to the beneficiary, constitutes his equitable estate therein. Similar in character is the right known as the *equity of redemption*, whereby a mortgagor is enabled, after the forfeiture of his mortgage, to redeem the mortgaged land or goods from the mortgagee. The legal title having, by the forfeiture, become completely vested in the latter, the right of redemption preserved by equity to the mortgagor may properly be regarded as a form of equitable estate. The large class of interests of this character known specifically as constructive trusts will be described under the title TRUST. See also EQUITABLE EASEMENT; EQUITY; USES.

EQUITABLE MORTGAGE. A lien created on property, either real or personal, without transferring the title thereto to the person intended to be secured. It is of the essence of the mortgage proper in the common-law system that the legal title to the property mortgaged shall pass to the creditor and remain in him until payment or foreclosure. But the equity tribunals have given the effect of a mortgage to a variety of transactions in which no property is actually transferred, but where it is the intention of the parties that it shall be pledged or subjected to a lien in favor of the creditor, in order to secure the payment of his claim.

The most striking example of the equitable mortgage is the lien upon land created by the deposit of title deeds to secure a loan or other obligation. This is in common use in England and occurs occasionally in a few of the United States. Everywhere, however, a mortgage deed which, through defective execution, fails to take effect in the manner intended, is treated as creating an equitable mortgage, and the same effect is given to any written agreement for a mortgage intended to have a present effect. An oral agreement to subject land to a mortgage lien is only prevented from producing a similar result by the Statute of Frauds, which renders void all agreements concerning lands which are not committed to writing; but under some circumstances effect is given by courts of equity even to these.

Similar to mortgages arising out of mere written agreements, as distinguished from convey-

ances, is the familiar security known as the mortgage on after-acquired property, as upon a fluctuating stock of goods in a store, upon machinery to be added to the equipment of a mill or factory, upon the future rolling stock of a railroad, etc. The familiar rule that no one can grant that which he does not have deprives such mortgages of any common-law validity beyond the property actually possessed at the time of the transaction. As to the property described in them which is afterward acquired by the mortgagor, the description operates only as an agreement to subject it to the lien as and when it becomes the property of the mortgagor. There is considerable diversity of judicial opinion as to the effect of such a mortgage; but the prevailing view, which obtains in England and in most of the United States, is that it creates an equitable mortgage on the after-acquired property valid as against the mortgagor, his heirs and creditors, and against purchasers with notice or without consideration. In New York a curious intermediate doctrine has been worked out by the courts, the property being protected against purchasers with notice, and such as acquire the property without consideration, but not against the claims of attaching creditors. Railroad mortgages on after-acquired property, whether real or personal, are, by reason of their exceptional character, universally held to be valid, even in jurisdictions in which such mortgages, as between private individuals, are not generally recognized.

As already indicated, in all cases of equitable mortgage the legal title to the property remains in the mortgagor, as well as the right of possession, the interest of the mortgagee being a mere lien which is enforceable only in equity and which is not protected by any common-law process. But as such a mortgage has, in general, priority over the claims of creditors of the mortgagor, as well as over the rights of subsequent purchasers and mortgagees, with notice, and as the recording of such an instrument under the recording acts in the United States gives constructive notice to all intending purchasers and lienors, it furnishes adequate security to creditors intended to be protected thereby. Strictly speaking, the remedy by foreclosure, which is the usual and proper process for the enforcement of a legal, or ordinary, mortgage, is not appropriate to a mortgage of this type. It is enforced by a bill in equity praying for the sale of the property under the authority of the court and for the payment of the mortgage debt out of the proceeds. As this process does not differ materially from the modern statutory proceeding employed in New York and some other States to foreclose a legal mortgage, the term "foreclosure" is, in such jurisdictions, also applied to it. See **EQUITABLE ESTATE; FORECLOSURE; MORTGAGE**; and the authorities cited under the last of these titles.

EQUITES, *ek'wi-téz*. See **EQUESTRIAN ORDER**.

EQUITY (Lat. *æquitas*, fairness, equality, from *æquus*, fair, equal). In law, a term sometimes used as synonymous with natural justice, as distinguished from the fixed and technical rules of law. In its technical sense the term signifies the system of jurisprudence originated and applied by the English Court of Chancery, and in the United States applied by various courts exercising a similar jurisdiction.

Equity jurisprudence, as a whole, comprises many unrelated rules and doctrines which, how-

ever, present a certain homogeneity due to three important factors common to their development, as follows: (1) their common source; (2) the kind of relief afforded, the court of chancery acting in personam, as distinguished from the courts of common law, which act in rem; (3) the object of, or rather the occasion for, the system. This occasion was the necessity of mitigating the rigor of the common-law system by preventing the inequitable application of rules of law and by affording a remedy when there was no remedy at law, or when the legal remedy, if any, was inadequate. The rights recognized, and corresponding remedies provided, by the English court of common law were early restricted to those obtainable by a limited number of forms of action of a fixed character. See **COMMON LAW; LAW; PLEADING**.

Even in cases where there was a remedy at common law it was frequently inadequate, owing to the fact that the common-law courts could award only the recovery of a sum of money or of specific real or personal property. They were powerless to prevent a threatened injury or to compel a defendant to perform a legal duty. Another source of difficulty was the fact that all actions at law were necessarily two-sided controversies, in which the judgment rendered must be either for a plaintiff or a defendant. The law courts were without the machinery for the settlement of a controversy in which several parties with distinct interests were involved. The Chancellor (Keeper of the King's Conscience), as administrator of justice upon conscientious grounds, and invested with the King's prerogative to issue orders or decrees directing the doing of an act, possessed all the requisite power to remedy these defects of the common law. The Chancellor could and did command things, other than the payment of money, to be done. He could summon before him all the parties to a controversy, however numerous, and in a single proceeding determine and adjust the rights of all. It is upon these simple but fundamental distinctions that the differences between the law and equity systems are based. While the discretion of the Chancellor was originally as wide as his sense of justice, the principles of equity jurisprudence early took on definite form, and were embodied in decisions which have substantially the same force as precedents as the decisions of the courts of common law. These principles are now for the most part fixed, and can only be changed by legislative action. For further discussion of the development of equity jurisdiction, see **CHANCERY**.

From the very nature of equity jurisprudence it follows that the jurisdiction of courts of equity is as extensive and as diverse as that of the courts of law whose remedies it was the aim of equity to supplement. It also follows from the supplementary character of equity that, as a prerequisite to the exercise of its jurisdiction, there should be no adequate remedy at law, which may result from the fact either that the legal remedy, because of its nature, cannot effect complete justice or that there is a right which courts of equity recognize and for which they will grant relief, but for which there is no legal remedy of any kind.

The jurisdiction of equity may be classified with reference to the jurisdiction of courts of law as (a) concurrent, (b) supplementary or auxiliary, (c) exclusive. Jurisdiction is said to

be *concurrent* where courts both of law and equity have jurisdiction over the subject matter but the exercise of jurisdiction by one court excludes the exercise of jurisdiction by the other. Thus, in case of breach of contract, the injured party may seek to recover damages at law, or, in a proper case, he may seek specific performance of the contract in equity, the choice of one remedy excluding resort to the other. Jurisdiction is *supplemental* when it affords a remedy in addition to, but not exclusive of, a legal remedy. Thus, the right of the mortgagor to redeem in equity and the jurisdiction of equity over legal waste are examples of supplemental jurisdiction. Jurisdiction is *exclusive* when equity affords relief in cases where there is no corresponding legal remedy; or, stated in different terms, when equity recognizes and protects a right which is not recognized at law, as in case of trusts, equitable easements, and equitable waste.

A comprehensive view of equity can best be obtained by an examination of the various forms of relief afforded by the court of chancery. These forms of relief may be roughly classified as (a) preventive and (b) remedial.

Courts of equity most frequently exercise their jurisdiction to prevent threatened injuries to property or analogous interests by means of an injunctive decree or order commanding the defendant to refrain from committing the threatened injury, or commanding him to do some act which would prevent the injury. The most common forms in which preventive jurisdiction is exercised are (1) bills to restrain the commission of tort, (2) bills of peace, (3) bills of interpleader, and (4) bills quia timet—in all of which the common ground for exercising jurisdiction is the prevention of threatened injury to the plaintiff, for whom there is no adequate legal remedy.

(1) *Bill to Restrain the Commission of a Tort*.—As a general rule, equity will restrain the commission of any tort which would result in injury to property and for which legal damages would not be an adequate remedy. Inadequacy may exist either because the damage is irreparable—i.e., the property could not be repaired or replaced by the sum received as damages, as, e.g., injuries to growing trees, or to a work of art, or to one's business; or the inadequacy may arise from the fact that the defendant (in equity) threatens to repeat a tort so frequently that the plaintiff will be compelled to resort repeatedly to a court of law to recover damages, in which case equity will restrain the commission of the tort. Thus, equity will restrain the defendant from trespassing repeatedly on the plaintiff's land, although legal damages for a single trespass would be adequate. Upon the principle of preventing irreparable injury to a property interest, equity will enjoin the publication of a trade secret belonging to the plaintiff, or of a private letter written by him.

Equity will not restrain a libel or slander, or the commission of a crime as such, though the mere fact that a threatened injury to property is also a crime will not prevent the exercise of equity jurisdiction. This self-limitation of jurisdiction is somewhat arbitrary, and in England and in most States courts of equity now have statutory jurisdiction to restrain the publication of trade libels.

(2) *Bill of Peace*.—The object of bills of peace is to relieve the plaintiff from the burden of

litigating a multiplicity of suits, either in law or equity. Thus, when one is compelled to bring or defend numerous actions at law or in equity in order to establish his right, a court of equity may issue an injunction restraining all the separate actions, and compelling the parties to try them all in equity in a single proceeding; or it may enjoin all the actions at law but a single one, and upon its conclusion adjust the rights of all parties in accordance with the result so obtained. The same relief may be obtained by the several plaintiffs or defendants in numerous actions at law or in equity who may unite in asking it.

(3) *Bill of Interpleader*.—The object of the bill of interpleader is to release the plaintiff from the demands of several parties all claiming of him payment of the same debt or performance of the same obligation. He is in the position of a stakeholder who is willing to pay over a sum of money to the proper party, but is unable to determine who is the proper party. Thus, payment is demanded of A (the maker of a promissory note) by both B and C, who claim to be owners of the note. Upon A's offering to pay the money into court and disclaiming any interest therein, equity will enjoin B and C from proceeding against A, and compel them to litigate the question of ownership of the note in equity. See INTERPLEADER.

(4) *Bill Quia Timet*.—The object of the bill quia timet is to compel the surrender and cancellation of an instrument upon which, although invalid, the holder might at some future time found an action at law or in equity against the plaintiff. The relief is granted upon the theory that through lapse of time the plaintiff might lose the evidence of the invalidity of the instrument and thus be subjected to an action after his defense to it is lost. This form of equity jurisdiction is clearly related to bills to remove cloud on title. See QUA TIMET.

Jurisdiction in which the relief is remedial is characterized by various forms of relief which seek, not to prevent threatened injuries, but rather to provide remedies for past wrongs more complete than the legal remedy, if any, or seek to confer upon the plaintiff rights not recognized at law. (Owing to the diverse character of these various forms of jurisdiction, it is impossible to classify them in a scientific manner. They may, however, be roughly grouped as follows:

I. Jurisdiction affecting contracts and analogous rights. II. Jurisdiction affecting title or other interests in real property. III. Jurisdiction in aid of actions at law.

I. *Jurisdiction Affecting Contracts and Analogous Rights* may be again roughly classified as follows: (1) specific performance of contract; (2) reformation and rescission of contracts and deeds; (3) marshaling; (4) subrogation; (5) creditor's bills; (6) bills for an account; (7) bills to compel contribution. Of these it may be observed that in each case the relief granted may, and frequently does, affect incidentally title or other property interests. In each case, however, the basis of equitable action is the protection or enforcement of a contract or analogous right.

(1) *Specific Performance of Contract* will be compelled by equity when legal damages for the breach of contract would be inadequate. And, given a case when equity would compel performance of a contract by one party to it, it

will—upon the so-called doctrine of mutuality—compel performance by the other, although his performance consists merely in the payment of a sum of money. Equity will not, however, compel performance of contract of a purely personal nature, as a contract to marry or to form a partnership; nor will it compel performance of contracts which would require the active supervision of the court over the performance, as a building contract.

(2) *Reformation and Rescission.*—Equity exercises its jurisdiction generally over contracts and deeds to make them conform to the intention of the parties. Whenever a term of a written contract is incorporated in or omitted from it by mistake, equity will compel a reformation, or, more properly, a reexecution of the contract in accordance with the intention of the parties. Where a contract is tainted with fraud, or there is a mistake preventing a meeting of the minds of the parties, a court of equity will declare the contract rescinded, and compel its cancellation by the parties to it. (See FRAUD; CONTRACT.) Upon similar principles, equity will sometimes compel the execution of new documents to replace lost documents which are necessary to support a claim of title. See REFORMATION; RESCISSION.

(3) *Marshaling* in equity is rather a general doctrine or rule of procedure than a specific form of relief. Briefly stated, the doctrine is that he who has two funds available to satisfy his demand shall not by his election to resort to one fund deprive another of his security who has only one of the two funds to satisfy his demand. Thus, in the case of suretyship, if one of the two sureties holds collateral security for his contract of suretyship, although both, on payment of the principal debt, are entitled to the security of the creditor's obligation, equity will compel the first to resort to his collateral security in order not to deprive the other of the benefit of the creditor's security. See MARSHALING; SURETYSHIP.

(4) *Subrogation* is also an equitable doctrine rather than a specific form of relief, and not one of universal application. In certain cases equity will, for the purpose of working out justice, treat one who has paid the debt of another as an assignee of the debt or claim, in which case he is said to be subrogated to the other's rights in such debt or claim. Thus, one who has loaned money to a corporation under an ultra vires contract, for the purpose of paying lawful debts of the corporation, may in equity be subrogated to the claims of those creditors whose claims are so paid, in order to avoid the injustice of denying him a recovery of the money loaned on the ground of the invalidity of the agreement. See SUBROGATION.

(5) *Creditor's Bills* are available to compel the reconveyance of property conveyed by a judgment debtor in fraud of his creditors or to subject to the creditors' process property—such as the debtor's interest in a trust estate—which is not subject to attachment or execution at common law.

(6) *Account.*—Equity will, in a proper case, compel a defendant to state an account to the plaintiff and then compel payment of the amount so found to be due. (See ACCOUNT.) This relief may be obtained on the ground that the defendant is a trustee or fiduciary, who is peculiarly the subject of equity jurisdiction, or that the account is too involved and complicated

to be properly dealt with by a court of law. This form of relief is to be distinguished from the now obsolete action of account at common law.

(7) *Contribution.*—Equity will, in a proper case, when one of several parties having a joint obligation has paid the obligation, compel the others to contribute pro rata to the payment. This doctrine is most frequently applied among cosureties, but has a more extensive application; and in some cases is applied among parties who at law have not incurred a joint obligation, but who on equitable principles are treated as though their undertaking were joint.

II. *Jurisdiction Affecting Titles or other Interests in Property* may be classified as follows: (1) bills to remove cloud on title; (2) partition; (3) bills to foreclose or redeem a mortgage; (4) bills to enforce liens; (5) jurisdiction over uses and trusts.

(1) *Bill to Remove Cloud on Title.*—Equity exercises its jurisdiction to compel the cancellation of any invalid document or record which, because of its apparent validity, creates a cloud, or apparent defect, in the title of the plaintiff. This form of relief is analogous to that granted upon bills quia timet. Strictly, however, the relief granted is not for the purpose of preventing a future attack upon the plaintiff's title, but for the purpose of aiding the plaintiff to secure a present marketable title to his real estate.

(2) *Partition.*—Equity early took jurisdiction to compel a partition of real estate held by joint tenants or tenants in common on the petition of any of them. It might accomplish this result by a division of the land among the several tenants by means of mutual conveyances, or by directing a sale of the land and a division of the proceeds.

(3) *Bill to Foreclose or Redeem a Mortgage.*—This was one of the early forms of supplementary jurisdiction and is a typical example of the growth and development of the equity system. See EQUITY OF REDEMPTION.

(4) *Bill to Enforce a Lien.*—At common law the various forms of lien gave the lien holder the right only to retain possession of the property which was subject to the lien. He could make no use of it, nor could he dispose of it in order to satisfy his claim. Equity exercised its jurisdiction to enforce such liens by judicial sale of the property, unless the defendant before the decree paid the amount due upon the lien. Equity also recognizes and enforces as liens mere agreements for a lien or mortgage which fall short of creating a common-law lien. See EQUITABLE MORTGAGE.

(5) *Jurisdiction over Uses and Trusts.*—Although this form of jurisdiction is in many ways analogous to the jurisdiction of equity over contract rights, its basis is the obligation which equity imposes on the trustee to hold the legal title of property for the benefit of another. For the purpose of effecting this result, equity compels the trustee to do any requisite act. It may compel him to convey the trust property or to account for its proceeds. It regards the interest of the beneficiary as analogous to a property interest at law and as subject to analogous rules of devolution. See EQUITABLE ESTATE; TRUST.

III. *Jurisdiction in Aid of Actions at Law.*—In two classes of cases equity came to the assistance of parties to actions at law. The assistance was rendered by means of (1) bills of discovery and (2) bills to perpetuate testimony.

(1) *Bill of Discovery*.—It often happened that a party to an action at law was unable (either because of the rules of evidence or because of his inability to secure evidence in advance of a trial) properly to prepare his case for trial or to prove his case at the trial. Equity came to his aid by compelling the defendant, in a proper case, to "make discovery" of the matter relevant to the trial at law. The effect was to compel the defendant to give to the plaintiff (in equity) the information which he sought, and to supply him with "admissions" made by the defendant, which could be used as evidence in the trial at law. See EVIDENCE.

(2) *Bill to Perpetuate Testimony*.—Equity early exercised its jurisdiction to take the testimony of witnesses to be used on the trial of an action at law. It might do this either on the ground that the witness was aged or infirm, and that his testimony might not be obtainable when it should be required for the trial at law, or because the plaintiff in equity, being a prospective defendant at law, feared that the plaintiff would postpone the action at law until the evidence was lost. This form of relief is analogous to bills quia timet, but is remedial rather than preventive.

Owing to the changes in rules of evidence and the various statutory forms of commission to take testimony, both bills of discovery and bills to perpetuate testimony are now generally obsolete, though they are still occasionally employed.

In the development of equity jurisprudence, certain maxims adopted by courts of chancery have played a considerable part. Frequent reference to these in the opinions of equity judges, as apparent rules of decision, has perhaps given them undue importance. Properly they are not fixed rules of general application, but rather apt phrases which are indicative merely of general guiding principles having many special applications and exceptions. The scope of this article will not permit their extended examination, and it will be sufficient to enumerate some of the more familiar maxims. Thus:

He who seeks equity must do equity.

He who comes into equity must come with clean hands.

Equity aids the diligent, not the slothful.

Equity follows the law (indicating that whenever legal rules are applicable equity will follow them—e.g., the Statute of Limitations).

Where equities are equal the legal title will prevail.

A proceeding in equity is not begun by writ as in a common-law action, but by petition, or bill, praying that a subpoena issue to the defendant compelling him to answer. The final relief granted by the court is embodied in an order or decree. The court of equity may grant any appropriate interlocutory relief. Consult: the commentaries of Blackstone and Kent; the authorities referred to under JURISPRUDENCE; and such special treatises as Pomeroy, *Treatise on Equity Jurisprudence as Administered in the United States* (3d ed., San Francisco, 1905); Bispham, *Principles of Equity* (7th ed., New York, 1905); Bigelow, *Elements of Equity* (Boston, 1899); White and Tudor, *Leading Cases in Equity* (7th ed., London, 1897); Kelke, *An Epitome of Leading Cases in Equity* (London, 1901).

EQUITY, COURTS OF. See CHANCERY.

EQUITY OF REDEMPTION. The estate

or interest which the mortgagor retains in mortgaged property. In strict legal theory, the expression has reference only to the right of the mortgagor to compel the redemption of the mortgaged property after forfeiture and after the title of the mortgagee has become absolute at law; but in practice the term is employed by lawyers as well as in popular speech to denote the residuum of interest left in the mortgagor after the making of the mortgage.

The legal effect of mortgaging property, whether real or personal, is to vest a defeasible title in the mortgagee, which, upon default of payment, becomes an absolute title at law. The common-law tribunals maintained the legal effect of the transaction with rigorous consistency, requiring the mortgagor to perform the condition of payment, upon which the conveyance had been made, to the letter. If he made his payment at the time and place specified, his title revived and the property became his again without a reconveyance. If he made default in payment on the "law day," the forfeiture was absolute and he was still liable to pay the debt in addition to losing the property. It was one of the earliest and greatest triumphs of the equity system to preserve to the unfortunate debtor the right to redeem his property, notwithstanding his default, by the subsequent payment of the debt with interest.

This innovation, which destroyed the legal effect of the forfeiture which had been incurred, was stoutly resisted by the common lawyers of the time, Sir Matthew Hale, when Chief Justice, declaring from the bench that by the growth of such equities the heart of the common law was eaten out. But the justice and humanity of the relief thus extended to the debtor were too obvious to permit a return to the system of forfeitures, and it soon became a recognized head of equity jurisdiction. Under this salutary system the mortgage has, both in law and equity, come to be considered merely a superior sort of lien, the mortgagor's equity of redemption representing for most purposes the real and substantial ownership of the mortgaged property. As such it may be conveyed, encumbered, or devised by the mortgagor; or it may be transmitted by descent to his heirs. It is liable for the debts of the mortgagor, like the rest of his property, and is, in the United States, subject to dower and curtesy.

Being thus an alienable estate, an interest in it may be acquired by any one to whom any estate or interest therein is granted, as a tenant for years, a subsequent mortgagee or other incumbrancer, the grantee of an easement, etc., as well as the heirs, devisees, and assignees of the mortgagor. Any person having such an interest has an equal right to redeem with the mortgagor himself. The mortgagee is not precluded from becoming the owner of the equity of redemption or of any interest therein by a purchase in good faith from any person having the right. The usual effect of such a conveyance to the mortgagee is to extinguish the equity and convert his defeasible title into an absolute title, though this result may be avoided if the intention of the parties or the interests of justice require that the equity be kept alive.

Originally the equitable right of redemption was unlimited in point of time, and this is still the case so long as the relation of mortgagor and mortgagee continues, unless it be cut off by the process known as foreclosure (q.v.), instituted

by a bill in equity. This process (known in some States as a "strict foreclosure," to distinguish it from the statutory proceeding for the sale of the mortgaged premises, to which the name of foreclosure has also come to be applied) has the effect of extinguishing the right or equity of redemption and of converting the mortgagee's conditional estate into an absolute one. Other than some process of foreclosure, there is, as is said above, no way in which the right of redemption can be abridged so long as the relation of mortgagor and mortgagee continues. But if this relation is terminated by the mortgagee's adverse occupation of the land, without any recognition of the mortgage, for the statutory period of limitation, the equity of redemption may also be cut off by lapse of time. This period is usually 20 years, but in some jurisdictions a shorter period of limitation of 10 or 12 years is provided by statute for extinguishing an equity of redemption by the adverse possession of the mortgagee. In the absence of statutes of limitation the equity tribunals have in some cases refused to recognize the right to redeem where the mortgagor or other party claiming the right had neglected for an unreasonable time to exercise it.

Popularly the expression "equity of redemption" is often employed to denote the value of mortgaged property over and above the amount of the mortgage debt with the interest that may be due thereon. See CHANCERY; EQUITY; FORFEITURE; MORTGAGE; REDEMPTION; and consult the authorities referred to under the article on MORTGAGE.

EQUITY PLEADING. That part of the procedure of courts of equity, or chancery, wherein the claims of the several parties to a controversy entertained by such a court are set forth and defined. The equity system of pleading is derived in part from that of the courts of common law but in much greater measure from that of the ecclesiastical courts, which, in their turn, derived it from the civil law system of Western Europe. This was due in part to the fact that the early chancellors in England were ecclesiastics trained in the canon law, which was itself based on the civil law, and were ignorant of the common law and its procedure, but more to the nature of the remedies afforded in the equity courts and to the principles on which it exercised its peculiar jurisdiction. Thus as the appeal to chancery was based on the inadequacy of the justice afforded by the ordinary (common law) tribunals, it naturally took on the form of a humble petition addressed to the king, praying for the relief elsewhere denied. In the common law courts, on the other hand, the pleading by which the suit was instituted was a simple declaration setting forth the grievances which the plaintiff alleged against the defendant and a demand of the particular redress which the ordinary jurisdiction afforded. In the course of time, however, the pleading in the equity courts has become even more closely assimilated to that of the common law and has, accordingly, departed more and more from that of the ecclesiastical law. Moreover in modern times the equity system of pleading, like that of common law pleading, has been greatly simplified, so that it consists at present of three "regular" pleadings,—the petition of the complainant, known as the bill, the answer of the defendant, and the replication of the complainant. The earlier formal

pleadings subsequent to the replication, as the rejoinder of the defendant, etc., have been merged in the three regular pleadings. Besides the regular pleadings, demurrers and pleas are also admitted in equity pleading. These were borrowed from the common law and retain essentially their common law functions. (See DEMURRER; PLEA.) The scope and flexibility of equity jurisdiction has given rise to a form of defense in chancery which is not possible in common law procedure, namely a counterattack by the defendant against the complainant, instituted by a cross bill. A familiar instance of this procedure is where a wife sues for a restitution of conjugal rights. The husband may set up, by way of defense, that she has been guilty of adultery, but he may also avail himself of the same fact as the ground of a cross action for divorce. In this way the whole issue can be tried in one and the same proceeding and the rights of the parties completely determined. See BILL; CROSS BILL; PLEADING; PROCEDURE.

E'QUIVALENT (from Lat. *æquivalere*, to have equal value, from *æquus*, equal + *valere*, to have power). A term used in geometry, to signify equality of area or volume. Thus, two triangles are said to be equivalent, or equal in area, or simply equal, if they have equal bases and equal altitudes. But if they are also similar in shape, they are said to be congruent, or identically equal. In algebra, two equations are said to be equivalent when the roots of each equation completely satisfy the other equation; e.g., if the same quantity is added to or subtracted from the two members of an equation, the result is an equivalent equation, since any root of $A = B$ is also a root of $A \pm C = B \pm C$, and any root of $A \pm C = B \pm C$ is also a root of $A = B$. But, while $x^2 = 2x$ and $x = 2$ are equations each of which is directly derivable from the other, they are not equivalent equations, for $x = 0$ is a root of the first equation, but not of the second.

EQUULEUS, é-kwóol'ë-us (Lat. a colt). A small northern constellation, lying almost on the equator, and surrounded by Pegasus, Aquarius, and Delphinus. Its chief objects of interest are the remarkable double star, δ *Equulei*, and the triple system, ϵ *Equulei*. The former has a parallax of 0.07", corresponding to a distance of 46 light years, and is one of the most rapid binaries known, its period being 5.7 years.

E'RA. See CHRONOLOGY.

ERAN', ERAN'IAN. See IRAN, IRANIAN.

ERA OF GOOD FEELING. A term applied in American political history to the period 1817 to 1824, during which there was virtually only one party—the Democratic-Republican—in the United States. That party, however, was broken up into personal factions. At the close of the War of 1812 the Federalist party had passed almost entirely out of existence, and in 1821 President Monroe was reelected by an electoral vote of 231 out of 232. The discussions over the tariff and internal improvements, however, soon caused new political alignments, and brought the "Era of Good Feeling" to a close. Different dates are given for the period by different writers on American history, some of whom restrict it to the second administration of Monroe.

ÉRARD, á'rär', SÉBASTIEN (1752–1831). A famous French piano and harp maker, born at Strassburg. He went to Paris, where the Duchess of Villeroy became his patron, and in her house

he made the first piano ever manufactured in France. He became famous and with his brother established a large factory in Paris and a branch in London. Thenceforward devoting his life to the development of his favorite instrument, the pianoforte, he brought it to a perfection before unknown, his most famous invention being the repetition action, first applied in 1821. For the harp he invented the double-action mechanism. He died near Paris.

ERAS, A'RAS, WOLFGANG (1843-92). A German economist, born at Schönfeld and educated at Leipzig, Jena, and Berlin. He was general secretary to the Rhenish-Westphalian Industrial Association from 1866 to 1870, in 1871 was appointed recorder of the Chamber of Commerce in Breslau, and in 1886 held the same position in the Textile Manufacturers' Association of Silesia. He was editor of the *Jahrbuch für Volkswirtschaft* in 1868-69. The following is a list of his more important publications: *Der Währungsstreit* (1883); *Einrichtungen für die Binnenschifffahrt an deutschen und holländischen Handelsplätzen* (1885); *Unser Handel mit den Balkanländern* (1891).

ERASED (from Lat. *erasus*, p.p. of *eradere*, to erase, from *c*, out + *radere*, to scrape) and **ERADICATED**. Terms in heraldry denoting that an object is plucked or torn off and showing a ragged edge; as opposed to *coupé* or *coupy*, cut, which shows a smooth edge. A tree plucked up by the roots is said to be eradicated. See **HERALDRY**.

ERASISTRATUS (Lat., from Gk. *Ἐρασίστροφος*). One of the most famous physicians and anatomists of ancient times. He was born at Iulis in the island of Ceos, the son of Cleombrotus and Cretoxene. He became the pupil of Metrodorus and Theophrastus and through Metrodorus was influenced by the views of Chrysippus. He traveled much and about 294 B.C. was body physician at the court of Seleucus Nicator, King of Syria. At a later time he resided at Samos, but, giving up practice, devoted himself to the study of the theory of anatomy at Alexandria. He was the rival of Herophilus. Erasistratus was the first to distinguish between the sensory nerves and the motor nerves and to trace both sets of nerves back to the substance of the brain. He also approached to the right view of the circulation of the blood in that he explained the origin of both the veins and the arteries as being in the heart. He held the strange view, however, that normally the arteries held only air, and that, when they were filled with blood, disease followed. He wrote many works on medicine and anatomy, of which we have a few fragments, preserved especially by Galen, and the titles of some 14 or 15. There was a sect of physicians who called themselves, from the name of their master, Erasistrateans. Consult: Hieronymus, *Erasistratei et Erasistratorum Historia* (Jena, 1790); Susemihl, *Geschichte der griechischen Litteratur*, vol. i (Leipzig, 1892); Fuchs, "De Erasistrato Capita Selecta," in *Hermes*, vol. xxix (Berlin, 1894), and in *Rheinisches Museum*, vol. lii (Frankfurt a. M., 1897). See **MEDICINE**.

ERASMUS, ē-rāz'mūs, DESDERIUS (c.1466-1536). One of the greatest scholars of the Renaissance and Reformation period. He was born at Rotterdam, October 28, probably in the year 1466. The materials for the history of his life are scanty and doubtful, being taken almost entirely from his own writings. In spite of the

obvious purpose of most of these materials to explain or to conceal matters of personal experience, they have been generally accepted by biographers as historical, and thus a kind of Erasmian legend has taken form, only partially cleared up by the labors of recent critical scholarship.

The fame of Erasmus rests upon his work as the chief interpreter to the peoples of northern Europe of the great intellectual movement of the fifteenth century. The circumstances of his uneventful life are of interest only as they illustrate this great service. He was, on his own statement, an illegitimate child, but was tenderly cared for by his parents until their death, when he was about 14 years old. They gave him the best attainable education at the famous school of Deventer and left him a little property—sufficient, he says, if it had been husbanded, to pay his way at a university. His guardians, however, took the more natural and safe course of placing him first at a school of the Brothers of the Common Life at Rois-le-Duc, where he spent, "or rather wasted," about three years, and then in the Augustinian monastery of Canons Regular at Steyn, near Gouda. Here he spent 10 years. He took priest's orders in 1492, but left the monastery, never to return, in 1492 or 1493. For a short time, in 1495 or 1496, he was at Paris. Then he began his career as an independent scholar, living by his pen and the favors it brought him, and continued this life till his death. With frequent intervals of wandering, he resided at Paris, Louvain, in England, at Basel, and Freiburg im Breisgau; for three years he was in Italy (1506-09). His chief attachments were in England and Basel. He was on terms of a certain intimacy with John Colet, founder of St. Paul's School; Thomas Linacre, founder of the London College of Physicians; William Grocyn, teacher of Greek at Oxford; and Thomas More, the great Chancellor. For a time he held a readership in Greek at Cambridge. His serious purpose to devote himself to the revival of "Theology, the Queen of Sciences," dates from his first acquaintance with these men in the last years of the century. Archbishop Warham, of Canterbury, gave him a substantial and permanent income. In Basel he was the intimate of a circle of reforming scholars who gathered about the famous publisher John Froben. In Italy he was for a time a member of the "familia" of the Venetian publisher Aldus Manutius. His correspondence, including more than 1500 letters, shows him in relations with over 500 persons, many of them of the highest station.

Down to the year 1517, when the Lutheran revolt began, the work of Erasmus was largely in criticism of the existing Roman Catholic church system and of the scholastic method in philosophy by which it was defended. In his *Enchiridion Militis Christiani* (The Manual or Dagger of the Christian Soldier, 1523) he lays down in didactic form the uselessness of forms in religion, as compared to the spirit of sincere apostolic piety. In his *Adagia* (1508), a collection of passages from classic authors, he adds to purely philological interpretation a running commentary of moral reflection which gave to this work an immediate and permanent success. In the *Colloquia* (1524), a series of dialogues on a variety of topics, there runs all through the same vein of serious comment on the vices and follies of priests, monks, philosophers,

miracle and relic mongers, and all the other formal shams of the time. Even in the *Encomium Moriae* (The Praise of Folly, 1509), perhaps the most biting, as it was doubtless the most popular, of his satirical writings, a fair examination detects throughout a serious undertone of protest. Still more important was Erasmus' great contribution to critical scholarship in his edition of the Greek New Testament, with a Latin translation, in 1516. Though not the first to conceive the plan of such an undertaking, Erasmus was first in the field, and might well reply to criticism of certain defects, that while others were carping he had done the work, and was quite content if only his service might point the way to other scholars.

With 1517 begins a distinctly new period in Erasmus' life. The Reformation, under Luther's vehement leadership, seemed at first to be only the practical application of ideas which he had always proclaimed. Hitherto he had been the critic, admired and dreaded; henceforth he was to be rather an apologist, not really trusted by either side, yet throwing his weight, unwillingly, now into one, now into the other scale. Personally he always refused to take sides. He remained a Catholic and always so declared himself, though he associated much with the Reformers, among whom he counted many of his friends. He continued his assaults on the evils and errors of the clerical powers, as in the *Colloquia*, but to be called a Lutheran drove him to fury. In the course of the Lutheran controversy Erasmus was drawn out especially by Ulrich von Hutten, once his most ardent admirer and follower, but now so disappointed and irritated by his hesitancy that he could not restrain himself. In his *Expostulatio* he charged Erasmus openly with concealing his real opinions for fear of consequences, and Erasmus replied in his *Spongia Adversus Aspergines Hutteni* (1523), declaring his respect for the Holy See, while at the same time he admits that he had opposed many of its extravagances. Urged on both sides to write something that would be decisive as to his theological position, he replied with the treatise *De Libero Arbitrio* (1524). In this he inveighs against Luther, who replied with the polemical treatise *De Servo Arbitrio contra Servum Des. Erasmus*. Stung by Luther's invective, Erasmus answered in his *Hyperaspides Diatribe contra Servum Arbitrium Lutheri*, in which he complains of the violence and bitterness of Luther's attack in a manner no less violent and bitter.

Erasmus is often thought of as chiefly a precursor of the Reformation. And yet, in the sense in which the term is used of men like Luther and Calvin, he never was a reformer at all. Upon ignorance and superstition he waged unrelenting war; but it was in the spirit of the humanist, not of the theologian, and the witty mockery of a Lucian was far more to his taste than the religious fervor of a St. Augustine. He was the incarnation of cool, critical common sense, with an unshaken faith in the necessity and efficacy, alike in the secular and ecclesiastical sphere, of liberal studies and freedom of thought. It seemed to him inevitable that increase of knowledge would of itself bring about a peaceful reform of abuses in the church. He had, too, the scholar's dislike of extreme views, which made it difficult for him to side definitely with either party, and the scholar's conservatism, which, with all its openness to new ideas,

is yet loath to give up forms consecrated by the life of the past, if in any way new vigor can be breathed into them. In fact, he never really understood the forces that were at work in the religious struggle; and in his letters, speaking of his own participation in it, deplors the metamorphosis of the worshiper of the Muses into a gladiator. But in the fields of Humanism he was easily the foremost man of his age. The range of his reading in the classics, both Latin and Greek, was extraordinarily wide, and he was scarcely less familiar with the most prominent of the Latin and Greek fathers. He loved travel, and, being by nature a keen and thoughtful observer, of social temper and vivacious conversation, had acquired a varied knowledge of men and manners in the frequent changes of residence, made for the sake of more favorable opportunities of work and study. A mind so well stored and possessed of so gay and nimble a fancy might be expected to show remarkable powers of productivity, and in fact Erasmus did compose some of his happiest and most characteristic things in an exceedingly short space of time. The *Encomium Moriae*, e.g., was sketched during his journey from Italy, and written out from his notes in seven days during his stay in Sir Thomas More's house in London. Still, splendid as was his equipment, the amount and range of his intellectual activity are little short of the marvelous. For he was by no means a genius, and his scholarly labors were accomplished only by unremitting industry. No one did more than he to restore ancient letters. He published editions of the works of Aristotle and Demosthenes, and translations of several of the plays of Euripides, of the greater part of Lucian, and of the *Moralia* of Plutarch. He edited, either in whole or in part, among other Latin authors, Terence, Cicero, and Livy, and, in addition, a long series of patristic writers. In 1505, in the preface to an edition of Lorenzo Valla's *Annotations to the New Testament*, he maintained that a correct translation of the Bible could be made only by a trained philologist, and that there was need of a critical revision of the original Greek text and of a new translation. Subsequently he decided to undertake this work himself; and in a letter to Colet, dated May, 1512, he says that he has already collated the New Testament with the ancient Greek manuscripts and annotated it in more than 1000 places. At the same time he was actively engaged upon a new edition, in nine folio volumes, of St. Jerome. Froben, whose press at Basel became for a while, through the editorial coöperation of Erasmus, the most important in Europe, has left us a vivid account of his incessant work, study, and writing, in and about the printing house, when these two works were approaching completion. "In the midst of all, visitors of rank would make no scruple of calling on him and interrupting him about some trifle or other; one would try to wheedle him out of an epigram, another to gain immortality by a letter. And how did he, the most easy, good-natured man in the world, act on these occasions? Did he refuse? Did he manifest impatience? He was fully occupied in writing—break off his employments he could not. Yet write he did, at odd moments, as he went to and from mass, anything to oblige." The medium of all his work was Latin. He refused the position of public reader at Louvain because of his imperfect mastery of Dutch,

though it was his native tongue. Of French he had some slight command, of English and Italian none. But Latin was still the colloquial language of scholars and the regular medium of formal communication. In the hands of Erasmus it has all the vitality of a living language, though far from classical in its standards, with a vocabulary drawn from many different sources, and a style wholly modern and individual, the charm of which is the expression of the man's own character.

The best guide to the writings of Erasmus is the *Bibliotheca Erasmiana*, edited by the University Library of Ghent (1893). Under the same editorship a still more complete *Bibliotheca Erasmiana*, in 16mo form, has been appearing in parts since 1897. There are editions of the complete works by Beatus Rhenanus (9 vols., Basel, 1540) and J. Le Clerc (10 vols., fol., Amsterdam, 1703-06). Erasmus himself collected many of his letters for publication, and in the years following his death several incomplete editions appeared. The more important later editions are those of Merula (Leyden, 1607), the "London Edition" of 1642 (in 2 vols., fol.), and vol. iii. of Le Clerc. Consult the text of his letters (Oxford, vol. i, 1906; vol. 2, 1910). *Epistles from his Earliest Letters to his 51st Year* have been published in an English translation by F. M. Nichols (2 vols., London, 1901-04). Attempts to fix the very uncertain chronology of Erasmus' life have been made by Richter, *Erasmus-Studien* (Dresden, 1891); Reich, *Untersuchungen, etc.* (Trèves, 1896); and Nichols, as above. For the life of Erasmus, consult: Knight (Cambridge, 1726); Durand de Laur (Paris, 1872); Drummond (London, 1873); Froude, *Lectures* (ib., 1894) and *Life and Letters* (New York, 1912); Emerton (New York, 1899); Pennington (London, 1901); Capey (ib., 1902); Allen, *Age of Erasmus* (Oxford, 1914).

ERASMUS, SAINT. A Syrian bishop of the third century, who is said to have suffered martyrdom at Formiæ (ancient form of Mola di Gaëta) in Campania, during the reign of Diocletian. In 842, when the Saracens took this city, his body was transferred to Cajeta. June 2 is dedicated to him by the Roman Catholic church.

ERASTIANS. Properly, the adherents of the doctrines laid down by Erastus (q.v.) in his book on excommunication. As commonly used, however, particularly in England, the term is applied to those who would entirely subordinate church government to the authority of the state, or maintain the authority of the civil magistrate over the conscience, and subject all ecclesiastical bodies to his control, both in doctrine and discipline. In the Westminster Assembly (1643-49) views similar to those of Erastus were advocated by the lawyers Selden, Saint-John, and Whitlocke, and the clergymen Lightfoot and Coleman. During the conflict in the Church of Scotland which resulted in the secession of the Free church (1833-34) the term "Erastian" was applied as a reproach to all who held that the church had no power to nullify by law the operation of lay patronage, but was indignantly rejected by them. Consult Cunningham, *Historical Theology*, vol. ii (Edinburgh, 1862), and Henson, *English Religion in the Seventeenth Century* (London, 1903).

ERASTUS (Lat., from Gk. *ἐπαρός*, lovely; a translation of his German name, Lieber or Lieb-

ler), THOMAS (1524-83). A Swiss physician and theologian. He was born in the Canton of Aargau, Sept. 7, 1524. He studied theology at Basel (1540-44) and adopted the doctrines of Zwingli. In 1544 he went to Italy and studied medicine at Padua and Bologna. After nine years he returned to his own country and became physician to the Count of Henneberg. He acquired a great reputation as a physician. In 1558 he went, by invitation, to the court of the Elector Palatine and became first physician and Privy Councilor and professor of medicine at the University of Heidelberg. In 1580 he accepted a similar appointment at Basel and in 1583 undertook also the professorship of ethics. He died at Basel, Dec. 31, 1583. Before his death he established a foundation for the education of poor students in medicine, which was long known as the Erastian Foundation. As a physician Erastus opposed the astrology and magic of Paracelsus and his school and held that experimental investigation is the true road to knowledge. He approved of prosecutions for witchcraft. A collected edition of his medical works appeared at Zurich in 1595. He is now remembered, however, chiefly for his theological writings. In 1564 he had taken part in the conference at Maulbronn between theologians from the Palatinate and Wittenberg and had contended for the Zwinglian doctrine of the Lord's Supper. In defense of this view he published his *Vom Verstand der Wort Christi, "Das ist mein Leib,"* in 1565. His great work is the *Explicatio Gravissimæ Questionis utrum Excommunicatio Mandato Nitatur Divino an Excoꝑitata Sit ab Hominiꝑus*. In this book Erastus maintains that, while the church may decide who are its members, it should do so upon doctrinal grounds alone, and not exclude for vice or immorality; and that in no case should the church inflict punishment, to do which properly belongs to the civil magistrate alone. He denies the right of excommunication altogether and compares a pastor to a professor of any science, who can merely instruct his students. The theory known in England as Erastian is not directly expressed in this book. The work was written in 1568, but not published until six years after Erastus' death. He had expressed similar views, however, during his lifetime in a controversy at Heidelberg with certain refugees from the Netherlands, and particularly one Caspar Olevianus, of Trèves, who were zealous for censures and excommunications and stirred up in the Palatinate what Erastus called a *febris excommunicatoria*. He was opposed at that time by Dathenus and Beza. Consult Lee, *The Theses of Erastus Touching Excommunication* (Edinburgh, 1844), and Bounard, *Thomas Eraste et la discipline ecclésiastique* (Lausanne, 1894).

ER'ATO (Lat., from Gk. *Ἐρατώ*). One of the nine Muses, daughters of Zeus and Mnemosyne. She presided over amatory and nuptial poetry. See **MUSES**.

ER'ATOS'THENES (Lat., from Gk. *Ἐρατοσθένης*) (c.275-195 B.C.). An eminent Greek astronomer and geometer. Eratosthenes was born at Cyrene; for a time he enjoyed the teaching of Lysanias and Callinachus and then went to Athens, where he heard the Stoic Ariston of Chios and the Academic Arcesilaus. Ptolemy III Euergetes recalled him to Alexandria and about 240 B.C. installed him as Callinachus' successor in the office of librarian. At the age of

80 or upward, having become totally blind, he died of voluntary starvation. Eratosthenes' interests covered an enormous range. He wrote a commentary to Plato's *Timæus* and also composed popular philosophical dialogues; in literary history he produced a great work, *On the Old Comedy*, in at least 12 books. This dealt with the theatre on its physical side and treated the works of the chief comic poets, discussing the authorship and date of plays, matters of text, language, and subject matter. His chronological researches also were important; he tried to fix the dates of the main events, in literature as in politics, from the time of the fall of Troy. In the field of pure mathematics he wrote on the doubling of the sphere and on a method of distinguishing prime and composite numbers. His astronomical views he set forth in part in the poems *Hermes*, *Erigone*, and probably *Anterings*. The extant work *Katasterismoi* (*Katareptaiol*), in which an account is given of the constellations in their relations to the popular mythology, is only a summary of a work by Eratosthenes which was apparently entitled *The Catalogues*, and in its present form has been worked over to follow the order of the *Phænomena* of Aratus.

It was, however, by his attempt to measure the size of the earth and by his geographical studies that Eratosthenes won most renown. He endeavored to determine the obliquity of the ecliptic by measuring the distance between the tropics; this he found to be $47^{\circ} 42' 39''$, which gave $23^{\circ} 51' 19.5''$ for the obliquity of the ecliptic. Considering the means of observation available and the state of knowledge at the time, the degree of error in his result—a trifle more than $23'$ —is remarkably small. To measure the circumference of the earth he adopted the means employed at the present day. He found that the distance between Syene and Alexandria was one-fiftieth of a great circle, about $7^{\circ} 13'$, and on this basis computed the circumference of the earth to be 250,000 stadia; but, since we do not know the length of the stadium Eratosthenes used as his unit, we cannot determine the degree of error in his result. His greatest scientific publication was probably his *Geography* (*Γεωγραφικά*), in three books, the first scientific treatise on the subject; it gave the history of the science and embodied the results of his own investigations. He knew, e.g., that the earth was round. In his researches Eratosthenes was greatly assisted by his patron, Ptolemy Euergetes, and he had the resources of the Alexandrian Library at his command. He was undoubtedly first among the Alexandrians for great and wide learning, although in the special fields of poetry and philosophy others surpassed him. The extant fragments of his writings are collected and discussed in the following works: Bernhardt, *Eratosthenica* (Berlin, 1822); Stiehle, "Zu den Fragmenten des Eratosthenes," in *Philologus*, supplementary vol. ii (Göttingen, 1863); Berger, *Die geographischen Fragmente des Eratosthenes* (Leipzig, 1880); Hiller, *Eratosthenis Carminum Reliquiæ* (ib., 1872); Maass, "Eratosthenica," in *Philologische Untersuchungen*, vol. vi, ed. by Kiessling and Wilamowitz-Müllendorff (Berlin, 1883); Robert, *Eratosthenis Catasterismorum Reliquiæ* (ib., 1878); Olivieri, "Pseudo-Eratosthenis Catasterismi," in *Mythographi Græci*, iii (Leipzig, 1897); Sussehl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit*, vol. i (ib., 1892); Christ-

Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1911). See ASTRONOMY; CHRONOLOGY; GEOGRAPHY, *History of Geography*.

ERB, *эрп*, WILHELM HEINRICH (1840–). A German neuropathologist. He was born at Winnweiler, Bavaria, and was educated at Heidelberg, Erlangen, and Munich. After occupying the chair of special pathology and therapy at Leipzig, from 1880 to 1883, he was appointed to the same department at Heidelberg, where he also was made clinical director. He was well known as a specialist on electrotherapy and neuropathology. He published the following works: *Handbuch der Krankheiten der peripheren cerebro-spinalen Nerven* (2d ed., 1876); *Handbuch der Krankheiten des Rückenmarks und des verlängerten Marks* (2d ed., 1878); *Handbuch der Elektrotherapie* (2d ed., 1886; Eng. trans. by L. Putzel, 1883); *Ueber die neuere Entwicklung der Nervenpathologie* (1880); *Dystrophia Muscularis Progressiva* (1891); *Gesammelte Abhandlungen* (1910).

ER'BEN, HENRY (1832–1909). An American naval officer, born in New York City. He graduated at the United States Naval Academy in 1854, was employed in deep-sea sounding in the Atlantic in 1855, and in 1856–59 served in the China station as a lieutenant on board the frigate *Mississippi*. During the Civil War he was with Farragut in the Gulf squadron, with Foote on the Mississippi River, and with Dupont in the attack on Charleston, and the blockade of the Mexican coast. He was commander of the New York Navy Yard in 1891–92 and of the European squadron in 1893–94. In 1894 he attained the rank of rear admiral and in the same year was retired from the service, but voluntarily returned to service in the Spanish-American War.

ERBEN, *эрбен*, KARL JAROMÍR (1811–70). A Czech scholar and poet. He was born at Miletin and was educated at Prague. He took a prominent part in the Czech movement of 1848, in 1850 became secretary of the Prague Museum, and town archivist in the following year. His chief historical publication is entitled *Regesta Diplomatica nec non Epistolaria Bohemica et Moravia* (1855). It was continued by Emler (1882–92). He was a gifted lyric poet, among his original verses being the collection of ballads entitled *Kytice* (A Bouquet; latest ed., 1890). His collection of Czech folk songs (3 vols., 1842–45, subsequently enlarged) was followed by another of popular melodies (1844–47 and 1860) and the publication of 100 Slavic folk tales (1863–65), which brought him a reputation comparable to that of the brothers Grimm. He also compiled a judicial terminology in Czech and published editions of several Czech authors, including the vernacular works of John Huss. Consult Novák, *Cechische Litteratur der Gegenwart* (Leipzig, 1907).

ER'BIUM (Neo-Lat., from *Ytterby* in Sweden). A metallic element discovered by Mosander in 1843. It is one of the constituents of the mineral gadolinite, which is found in Ytterby, Sweden. Erbium (symbol Er, atomic weight 167.7) is similar to the elements yttrium and ytterbium, with which it is found, and forms a series of rose-colored salts that give an acid reaction with litmus, but have a sweet astringent taste. Among the inorganic salts of erbium may be mentioned the *sulphate*, $\text{Er}_2(\text{SO}_4)_3 + 8\text{H}_2\text{O}$; the *nitrate*, $\text{Er}(\text{NO}_3)_3 + 5\text{H}_2\text{O}$; and the very soluble *double sulphates* of

erbium with potassium, $\text{Er}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 + 4\text{H}_2\text{O}$, and with ammonium, $\text{Er}_2(\text{SO}_4)_3 \cdot (\text{NH}_4)_2\text{SO}_4 + 4\text{H}_2\text{O}$. The oxide of erbium, Er_2O_3 , is obtained in the form of a pink powder.

ERBT, érpt, WILHELM (1876-). A German biblical scholar, born in Berlin and educated at the universities of Halle, Greifswald, and Leipzig, and at the preachers' seminary in Wittenberg. He taught in several girls' schools and held pastorates, but is better known for his excellent works on Hebrew religion and related subjects. He wrote: *Die Purimsage in der Bibel* (1900); *Jeremia und seine Zeit* (1902); *Sicherstellung des Monotheismus* (1903); *Israel und Juda* (1903); *Die Urgeschichte der Bibel* (1904); *Die Hebräer* (1906); *Elia, Elisa, Jona* (1907); *Handbuch zum Alten Testament* (1909); *Kirchengeschichte* (5th ed., 1913); *Das Markusevangelium* (1911); *Von Jerusalem nach Rom* (1912); *Geschichte der Religion in der Alten Welt* (1913).

ER/CELDOUNE, THOMAS OF. See THOMAS THE RHYMER.

ERCILLA Y ZÚÑIGA, ár-thé'lyá è thóv'-nyé-gú, ALONSO DE (1533-94). A Spanish epic poet, who enjoys the distinction of having written the first work of literary merit known to have been composed upon either American continent. He was born in Madrid, became page to Philip II, and accompanied the latter to England on the occasion of his nuptials with Queen Mary. Thence Ercilla sailed for America with the army dispatched to quell the insurrection of the Araucanians in Chile. Here the brave resistance of the natives in the unequal struggle inspired Ercilla with the idea of using the subject for an epic poem. An unfounded suspicion of his having plotted an insurrection ruined his career, and he was tried, condemned, and had actually ascended the scaffold, when his sentence was commuted to exile at Callao. He returned to Europe in 1562, and, after giving to Philip an account of his services, he set out for Austria to find his sister, who was *dame d'honneur* to the Empress, and whose hand was being sought in marriage. He wandered through France, Italy, Germany, Bohemia, and Hungary, and returned in 1564 via Switzerland and the Languedoc. In 1571 the King gave him the habit of the Order of Santiago, and he was dubbed Knight on November 30, the anniversary of the bloody battle of Millarapué, which his valor had been largely instrumental in winning. For a while he held the office of chamberlain to the Emperor Rudolph II, but in 1577 he returned to Madrid, where, after a period of royal favor lasting until 1588, he fell into disfavor and died in poverty and obscurity. The first 15 cantos of his epic, *La Araucana*, written in the *ottava rima*, appeared in 1569; the continuations, 37 cantos in all, were published in 1578 and 1589. In 1590 appeared a new edition augmented by two cantos. A convenient edition is in the *Biblioteca de autores españoles*, vol. xvii. A continuation, of little value, was written by Diego de Santisteban y Osorio (Salamanca, 1597). Consult A. Royer, *Etude littéraire sur l'Araucana d'Ercilla* (Dijon, 1879), and A. Bello, *Obras completas* (vol. vi, Santiago de Chile, 1883). Consult also the facsimile of the princeps edition (parts i, ii), made by Archer M. Huntington (New York, 1902-03).

ERCKMANN-CHATRIAN, érk'mán-shá'-tré'an'. The name employed to indicate the

joint authorship of EMILE ERCKMANN (1822-99) and ALEXANDRE CHATRIAN (1826-90), whose combined work affords one of the most remarkable instances of modern collaboration. Erckmann was born in Pfalzburg (in Lorraine). Chatrian at Soldatenthal (in the same district). Both were, therefore, of that border territory annexed to Germany in 1871, in which is laid the scene of most of their works. Erckmann had successfully studied law in Paris, and Chatrian for a time had been an instructor in the college at Pfalzburg, when they began the publication, in the *Démocrate du Rhin*, of a series of feuilletons. The story "L'illustre docteur Mathéus" (1859), originally published in the *Revue Nouvelle*, was their first success. This they followed up with a long and widely read series, of which the *Histoire d'un concert de 1813* (1864; 20th ed., 1869; Eng. trans., 1909) is the best-known volume. *L'ami Fritz* (1864) and *Waterloo* (15th ed., 1865; Eng. trans., 1905), a sequel to the *Concert*, should also be mentioned. As dramatists, Erckmann and Chatrian appeared in two productions of much merit. *Le juif polonais* (1869) and *L'ami Fritz* (1876), the latter derived from their book of that name. The former is familiar in England and America through its adaptation (1871) by Leopold Lewis as *The Bells*, the Mathias of which was one of the most skillful impersonations in the repertoire of Sir Henry Irving. The stories are marked by humor, clever characterization, and convincing details of local color, and also by their democracy, patriotism, and antimilitarism. The literary partnership was finally dissolved. Erckmann's independent work is of less importance. An edition by Pfau, of German translations of the chief joint works, appeared at Stuttgart in 1882 (9 vols.). Their joint work also includes: *Histoires et contes fantastiques* (1849); *Madame Thérèse* (1863; 13th ed., 1869; Eng. trans., 1910); *Le Blocus* (1867); *Histoire d'un paysan* (4 vols., 1868-70); *L'Histoire du plébisците* (1872); *Le Grandpère Lebique* (1880).

ERDÉLYI, ér'dál-yé, JÁNOS (1814-68). An Hungarian poet and folklorist, born at Kapos. He published a number of works fairly well known in his native country, in 1848 was appointed director of the national theatre at Pest, and in 1849 became professor of philosophy at Sárospatak. He is remembered for a collection of the popular songs and legends of Hungary, *Népdalok és mondák* (3 vols., 1846-48), which is an important addition to the folklore of Europe. His collection of Hungarian proverbs (Pest, 1851) is noteworthy, containing over 7000 hitherto unknown examples. Some of his smaller works were translated into German under the titles *Bahnen und Palmen* (1886) and *Studien* (1890).

ERDMANN, ért'mán, BENNO (1851-). A German philosopher, born at Guhrau, Prussian Silesia, the son of Johann Eduard Erdmann. He was made professor successively at Kiel (1877), at Breslau (1884), at Halle (1890), at Bonn (1898), and at Berlin (1909). His works, devoted principally to the Kantian philosophy, include the following: *Kants Kriticismus* (1878); *Nachträge zu Kants Kritik der reinen Vernunft* (1881); *Reflexionen Kants zur kritischen Philosophie* (1882-84); *Logik* (1892 ff.); *Psychologische Untersuchungen über das Wesen der experimenteller Grundlagé* (1898);

Immanuel Kant (1904); *Wissenschaftliche Hypothesen über Leib und Seele* (1908).

ERDMANN, DAVID (1821–1905). A German Protestant theologian. He was born at Güstebiese, Province of Brandenburg, and was educated at Berlin, where in 1860 he became assistant preacher in the cathedral. In 1856 he became professor of theology at Königsberg, and in 1864 was appointed Superintendent-General of Silesia at Breslau. His appointment as Superior Consistorial Counselor followed in 1880. He retired in 1900. Erdmann wrote: *Lieben und Leiden der ersten Christen* (1854); *Die Reformation und ihre Martyrer in Italien* (1855); a commentary on the Epistle of James (1881); *Luther und die Hohenzollern* (2d ed., 1884); "Samuel," in *Lange's Bibelwerk* (1873). Consult Eberlein, *Aus einem reichen Leben: Blätter der Erinnerung an David Erdmann* (Berlin, 1907).

ERDMANN, JOHANN EDUARD (1805–92). A German philosopher, born at Wolmar, Livonia. He studied theology at Dorpat, attended the lectures of Schleiermacher and Hegel at Berlin, and was then pastor in his native town (1829–32). In 1834 he became privatdocent in philosophy at Berlin, and in 1836 he was appointed professor of philosophy at Halle. His many writings on philosophical subjects show his sympathy with Hegel's ideas, and he was one of his prominent disciples. As a teacher and lecturer, he was extremely popular. His most important work is his *Grundriss der Geschichte der Philosophie* (1866; Eng. trans., 1892), which is still in the later editions a most useful book. Among his other numerous works may be mentioned: *Grundriss der Psychologie* (1840); *Grundriss der Logik und Metaphysik* (1841); *Psychologische Briefe* (1851).

ERDMANN, OTTO LINNÉ (1804–69). A German chemist, born in Dresden. He studied at the Academy of Medicine and Surgery in Dresden, then devoted himself to chemistry, and, after several years of theoretical study and industrial work, became in 1827 professor of industrial chemistry at the University of Leipzig, from which he had graduated with the degree of Ph.D. in 1824. Among his valuable contributions to chemistry, his atomic-weight determinations, his investigations of the properties of nickel, and his researches on illuminating gas and a number of dyestuffs deserve mention. He wrote: *Grundriss der Warenkunde* (1833; 12th ed., 1895); *Ueber das Studium der Chemie* (1861), which has been translated into several European languages; etc. He was the founder, and for several years editor, of the *Journal für technische und ökonomische Chemie* and later edited the *Journal für praktische Chemie*.

ERDMANNSDÖRFER, ert'māns-dör'fēr, MAX (1848–1905). A German musician. He was born at Nuremberg, and from 1863 to 1869 studied at the conservatories of Leipzig and Dresden. After conducting the court orchestra at Sondershausen from 1871 to 1880, he was in 1882 appointed director of the Imperial Musical Society at Moscow and professor in the Conservatory there. As the founder of the Students' Orchestral Society at the latter institution (1885), he contributed greatly to the development of a genuine musical spirit among its pupils. He was leader of the Philharmonic Society at Bremen from 1889 to 1895. He subsequently became conductor of the Symphony

Concerts at St. Petersburg for a short time and was in 1896 appointed leader of the court orchestra at Munich. His works include: *Prinzessin Ilse* (1870); *Schneewittchen* (1873); *Traumkönig und sein Lieb*, forest legends for soli, chorus, and orchestra.

ERDMANNSDÖRFER, DEBNHARD (1833–1901). A German historian. He was born at Altenburg and, after studying at Jena and Berlin, went to Italy for the purpose of carrying on philological and historical investigations. He was appointed assistant professor of history at the University of Berlin in 1869 and subsequently held full professorships at Greifswald, Breslau, and Heidelberg, where he succeeded Treitschke. Among his principal works may be mentioned: *De Commercio quod inter Venetos et Germaniae Civitates Avo Medio Intercessit* (1858); *Deutsche Geschichte vom westfälischen Frieden bis zum Regierungsantritt Friedrichs des Grossen* (1888 et seq.). He edited the "Politischen Verhandlungen" (5 vols., 1864–83), in the *Urkunden und Aktenstücke zur Geschichte des Kurfürsten Friedrich Wilhelm von Brandenburg*.

EREBUS (Lat., from Gk. *ἐρεβος*, *erebos*, darkness). A term used by the ancient Greeks and Romans specially to denote the darkness of the lower world, and hence employed to denote the lower world itself. From Erebus Hercules brought Cerberus; to it the souls of the departed went. In the mythographers Erebus is called a son of Chaos, and father of *Æther* and *Hemera* (Day).

EREBUS AND TERROR. Two volcanoes in South Victoria Land (q.v.). Mount Erebus is 12,370 feet high, and was active when the two were discovered by Sir J. C. Ross in 1841. A party from Shackleton's expedition ascended the volcano during March, 1908, and found proofs sufficient to show that Erebus possesses still considerable volcanic activity. Mount Terror, situated about 30 miles farther east and nearer the coast, is about 10,900 feet high and is probably extinct. The volcanoes received their names from the two vessels used by Ross in his expedition.

EREC AND ENID. A metrical romance by Chrestien de Troyes, recounting the fortunes of an Arthurian knight who marries the niece of a vanquished enemy, sinks into the slothful enjoyment of the pleasures of love, is quickened to renewed action by the reproaches of his vassals, and, with his wife, goes forth to seek knightly adventures.

ERECH, ēr'ek (Assyrian *Uruk*, Gk. *Ὀρχος*, *Orchog*, Heb. *Erek*). A city in ancient Babylonia. Its site is at the modern village of Warka, where large mounds and numerous ruins testify to its extent in former times. Excavations on the spot have furnished a few documents from the time of Gudea of Lagash, and Ur Engur and Dungi of Ur; of Singashid, when Erech was the capital of the State of Amnana; and of Mardukapaliddin (721–710 B.C.). The German excavations in 1913 threw light upon the Seleucid and Arsacid periods, but less attention seems to have been paid to the lower strata. The city is frequently referred to in Assyrian and Babylonian literature. Its foundation is ascribed to Marduk, but its most famous shrine was the Temple of Nana. This goddess was carried into Elamitish captivity for 135 years but brought back by Asurbanipal

c.640 B.C. Erech is the scene of many important myths. Recent discoveries showed that there were at least two important dynasties reigning there. (See BABYLONIA.) Its situation rendered it comparatively secure against invasions, and its commercial prosperity is indicated in many contract tablets. It seems to have flourished into the Parthian period. Consult Loftus, *Travels and Researches in Chaldea and Susiana, with an Account of Excavations at Warka* (London, 1857), and Ed. Meyer, *Geschichte des Altertums* (3d ed., Berlin, 1913).

ERECHTHEUM (Lat., from Gk. Ἐρεχθειον, *Erechtheion*, (temple) belonging to Erechtheus). A temple on the Acropolis of Athens, northwest of the Parthenon, in which were combined the sanctuaries of Athena Polias and Erechtheus (q.v.). It also contained several other wonders, such as the "salt sea" of Poseidon and the mark of his trident, made by Poseidon when he created the horse in his contest with Athena for the possession of Attica, while near by was the sacred olive of Athena, and apparently the tomb of Cecrops. To make surer the preservation of these sacred tokens, the building, though of great beauty, departs widely from the ordinary type of Greek temple. It consists of a quadrangular main building, 74 feet by 37, with porticoes on three sides. The level of the east and south sides is about 9 feet higher than that of the west and north sides. At the east the portico extends across the entire front of the temple, and its roof is supported by six Ionic columns. The north and south porticoes are at the west end of the building. That on the south is the Porch of the Maidens, so called from the six female statues, somewhat larger than life, which support the roof. (See CARYATIDES.) The north porch is on a lower level than the east or south and also contains Ionic columns, arranged like the statues, four in front and one on each side. There seem to have been no pediment sculptures, but above the architrave was a frieze of dark marble, decorated with reliefs of white marble. Of these figures only fragments have been preserved. The west front had a gable supported by four columns, resting on a somewhat high wall, in which is a low door. During the Roman period these columns were replaced by engaged columns between which were windows. The interior arrangements are still a matter of much dispute, due partly to the differences in level, and partly to alterations made when the building was transformed into a Byzantine church. It seems clear that the shrine of Athena Polias, with the sacred wooden image, was in the east end, and the Erechtheum proper in the west. The building was begun, probably, about 421 B.C. (some say 437 B.C.); inscriptions show that it was nearly complete in 409 B.C. It seems to have suffered from fire in 406 B.C., and was probably still unfinished in 395 B.C. The Greeks have lately restored the building, as far as was possible, from the pieces lying around; for a photograph of the restored structure, consult the work by Bates cited below, page 318. From a careful study recently devoted to the temple it has been demonstrated that the eastern part of the cella was lighted by two windows, one on each side of the door. Consult Fowler, *Papers of the American School at Athens*, vol. i (Boston, 1885), for a description of the building in 1883, with bibliography; also Baumeister, *Denkmäler des klassischen Al-*

tertums, s.v. *Erechtheion* (Munich, 1885); Frazer, *Pausanias*, vol. ii (2d ed., London, 1913); Stevens, *American Journal of Archaeology*, vol. x (1906); Harrison and Verrall, *Mythology and Monuments of Ancient Athens* (London, 1890); E. A. Gardner, *Ancient Athens* (New York, 1902); D'Ooge, *The Acropolis of Athens* (ib., 1908); Baedeker, *Greece* (4th Eng. ed., Leipzig, 1909); Weller, *Athens and its Monuments* (New York, 1913). For an original treatment of the Erechtheum, consult Elderkin, *Problems in Periclean Buildings* (Princeton, 1912).

ERECHTHEUS, or **ERICHTHONIUS** (Lat., from Gk. Ἐρεχθεύς, Ἐριχθόνιος, *Erechtheus*, *Erichthonios*). A character in Greek mythology. Erechtheus is called, in the *Iliad*, son of the earth and was reared by Athena in her temple on the Acropolis, where the Athenians worshipped him. Later writers told a similar story of Erichthonius. He was son of Hephaestus and Gea (the earth), and was placed by Athena in a chest with a serpent (perhaps rather the child was in whole or in part in the form of a serpent). The daughters of Cecrops, to whom the chest was given, disobeyed the command of the goddess and raised the lid, when they were either destroyed by the serpent or in sudden madness at sight of it threw themselves from the rocks of the Acropolis. This form of the legend made Erechtheus son or grandson of Erichthonius and told of his sacrifice of his daughter to save Athens from the attack of Eumolpus (q.v.). It is to be noted that while the later poets and mythologists distinguish Erichthonius and Erechtheus, the early epic and the cult know only the latter, who is clearly an Athenian god of agriculture, who was worshipped with the goddess Athena in a joint temple, called the Erechtheum (q.v.), on the Acropolis. Later legend reduced him to a hero and connected him with Poseidon, or told of him as the promoter of the worship of Athena.

Powell, "Erichthonius and the Three Daughters of Cecrops," in *Cornell Studies in Classical Philology* (1906), regarded Erechtheus, Erichthonius, Poseidon, and Cecrops as all alike representatives of the sacred serpent of Athena; with the cult represented by them Athena at first had to struggle, but later she conquered it and fused it with her own. Consult also Farnell, *Cults of the Greek States*, vol. i (Oxford, 1896), and Frazer, *Pausanias*, vol. ii (2d ed., London, 1913).

EREGLI, a-ra'glé (ancient *Heracleia Pontica*). A seaport town of Asiatic Turkey, in the Vilayet of Kastamuni, situated on the Black Sea about 128 miles east of Constantinople (Map: Turkey in Asia, B 2). Its harbor, which is known by the name of Zoungundak, is the outlet for the coal mined in the neighborhood. The coal fields of this region are the only ones developed in Turkey. About 750,000 tons are extracted annually. The mines are owned chiefly by French capitalists. The population is estimated at about 6300.

EREMITA, JOHANNES. See CASSIANUS.

EREMIT VON GAUTING, a're-mot' fön gou'ing. See HALLBERG-BROTCH, THEODOR M. H.

ERETRIA (Lat., from Gk. Ἐρέτρια). A city on the west coast of Euboea, south of Chalcis, of which it was in early times a powerful rival. It helped the Asiatic Greeks of Ionia in their revolt against the Persians (498 B.C.); hence it was destroyed by the Persians in 490. It was, however, soon rebuilt, though it was not prom-

THE ERECHTHEUM
PORCH OF THE CARYATIDES

inent in later history, except for a short time during the struggle between Athens and Philip of Macedon. It was the seat of the school of philosophy established by Menedemus, a disciple of Plato. The American School at Athens conducted excavations on this site (1890-95), resulting in the discovery of the theatre and some neighboring buildings, and further investigations are being carried on by the Greek Archaeological Society, which have brought to light an early temple and many lesser remains of the pre-Persian time. The site is occupied by a village called Nea Parsa. Consult *Papers of the American School at Athens*, vol. vi. See GREECE, *History, Ancient History*.

ERFORDIA. See ERFURT.

ERFURT, ɛrfurt (OHG. *Erpisdorf, Erpesfurt*, Lat. *Erfordia*, ford of Erpe, its legendary founder). A town of the Prussian Province of Saxony, 14 miles west of Weimar (Map: Prussia, D 3). It is the capital of the government district of Erfurt (area, 1364 square miles; pop., 1910, 530,775). Erfurt is situated on the Gera, which traverses the town in three arms. An important fortress until 1873, Erfurt retains only portions of the citadels of Petersberg and Cyriaxburg. The town, which has an ancient aspect, is irregularly built, and many of its streets are narrow and bordered with old-fashioned houses. The most noteworthy church of Erfurt is the cathedral (*Beatae Mariæ Virginis*), occupying the site of an old edifice dating from the twelfth century and constructed mainly during the thirteenth, fourteenth, and fifteenth centuries. It is one of the finest churches in Germany. Its foundation is of enormous proportions, and its interior is ornamented with fine reliefs, paintings, stained glass, and carved choir stalls. The nave was rebuilt in the thirteenth century in the Gothic style. The chancel dates from 1349 to 1372. The twin towers date from the thirteenth century and contain 10 bells, including the Maria Gloriosa, which bears the date 1497 and weighs over 13 tons. Adjoining the cathedral is the great fourteenth-century church of St. Severus, with three pointed towers, altar reliefs, and statues. The cathedral and St. Severus occupy an eminence known as the Domberg and form an impressive mass, approached by a flight of 48 stone steps. The two churches are Roman Catholic. There are several other mediæval churches, now Evangelical; among them are the Reglerkirche, in Romanesque style, which has a twelfth-century tower and was restored in 1859; the twelfth-century Predigerkirche; and the Gothic Barfüsserkerche, which has interesting fourteenth-century monuments. Of the numerous monasteries of Erfurt only two have survived, of which that of St. Augustine, famous as the residence of Luther, now serves as an orphanage, while the other is used as a school for girls. Among the secular buildings the most prominent are the Rathaus, erected in 1860-75 and adorned with frescoes; the courthouse, the central railway station, and the government buildings occupied in 1808 by Napoleon during his famous sojourn here.

The city is administered by a chief burgo-master, a burgomaster, a board of magistrates of 15 members, and a municipal council of 48 members. It owns its water works, a pawnshop, and an abattoir. The street railways are run by electricity. There was formerly a university, established in 1378, but discontinued in

1816. The most prominent educational institutions now are the gymnasium originally founded in 1561, a real gymnasium, a real-schule, a teachers' seminary, and several art and technical schools. There should also be mentioned the royal library, with over 60,000 volumes and 7700 manuscripts, the municipal theatre, and the museum of Thuringian antiquities and costumes. The chief industries of Erfurt are the manufacture of ladies' cloaks, shoes, iron products, woolen, cotton, and linen goods, machines, arms, and cigars. Another important industry is the culture of flowers and vegetables, of which Erfurt exports large quantities. The commerce is of some magnitude, and there are several important financial institutions. Pop., 1875, 48,025; 1890, 72,360; 1900, 85,202; 1910, 111,463, of whom about seven-eighths are Protestants. The commune has an area of about 17 square miles.

Erfurt traces its origin to a mythical founder, Erpe, of the sixth century. St. Boniface established a bishopric at Erfurt in 741, but it reverted to Mainz in 755. Charlemagne made it a staple town in 805. Though ruled by governors appointed by the archbishops of Mainz, who claimed sovereignty because of royal charter rights, Erfurt possessed extensive municipal rights till 1664, and in the fifteenth century, when it belonged to the Hanseatic League, was exceedingly prosperous, enjoying freedom of trade throughout the Empire and ruling over a considerable district, acquired either by force or purchase. From 1433 to 1648 Erfurt belonged to Saxony. After Westphalia it was given back to Mainz and remained in her possession until 1802. In 1802 it came to Prussia and in 1806 passed to France. At Erfurt, in 1808, Napoleon played the conqueror for several months, there being present Alexander of Russia and a host of German princes. In 1814 the town was recovered by Prussia. In 1850 Erfurt was the seat of the Union Parliament. (See GERMANY.) In 1902 the hundredth anniversary of Erfurt's incorporation with Prussia was celebrated. Consult: Tettau, *Erfurt in seiner Vergangenheit und Gegenwart* (Erfurt, 1880); Rühl, "Erfurt," in *Europäische Wanderbilder* (Zurich, 1888); Beyer, *Geschichte der Stadt Erfurt* (Erfurt, 1900).

ERG, ɛrg (abbreviated from the Gk. *ἔργον*, *ergon*, work; connected with Av. *varas*, to do, Goth. *waurkjan*, AS. *wyrcean*, OHG. *wirken*, Ger. *wirken*, Eng. *work*). The unit of work or energy on the C. G. S. system (q.v.). It is the work done when a force of one dyne acts through, or is overcome through, a distance of one centimeter. It is also the energy of two grams moving with a unit speed. (See ENERGETICS.) Since it is so small a unit, a multiple of it, viz., 10⁷ ergs, the so-called "joule," is used more generally. See MECHANICAL UNITS; MECHANIOS; CALORIMETRY.

ER/GASTERIA. See LAURION.

ERGOT, ɛr'got (Fr. *ergot*, *argot*, spur, extremity of a dead branch). A name given to the peculiar, hard, purplish-black bodies that sometimes replace the grain in the head of rye or other grasses. These ergots are the result of the development of the fungus *Claviceps purpurea* and other species within the ovaries of the grasses. The sclerotia, as the hard bodies are called, are usually solid, are white within, and when fresh have a peculiar waxy or oily appearance and a heavy characteristic

odor. Those produced on rye and some other grasses may be many times larger than the seed which they replace, attaining a length of an inch or more; but in wheat and in some of the smaller grasses they are smaller than the seed and may not be noticed until crushed, when they are recognized by their odor. The fungus origin of ergot has been more or less understood since 1838, but its true cause and the life history of the organism were unknown until Tulasne published the results of his investigations in 1853. If a grain of ergot be placed in suitable conditions of moisture and temperature, it will soon send out a number of small stalks, each surmounted by small globular heads which contain a multitude of spores. In nature these are produced from ergot sown with the grain, or from that which has fallen to the ground where it wintered, the spores maturing about the time the grass is in flower. The ripened spores are blown about by the wind, and some find lodgment upon the styles of the grass. Here they germinate and find their way into the ovary of the flower, where they develop an abundant mycelium and put out many short branches, each of which produces a single conidium. At the same time a sweet, milky juice is secreted, called honey-dew, in which the conidia float about until

carried away by insects visiting the flower for this sweet substance. When taken to another flower, the conidia germinate and set up a new infection similar to that already described. During all this time the fungus within the flowers continues to grow and forms a dense mass of hyphae, completely obliterating the seed whose place it occupies. Later, the formation of conidia ceases, and the fully grown mycelium is transformed into a sclerotium, the dark-colored ergot, which, when mature, falls to the ground or is harvested with the grain.

Ergot is a powerful emmenagogue, ecboic, and hæmostatic, and is poisonous to human beings and higher animals, and occupies an important place in medicine. For this purpose the ergot of rye is preferred, the principal supplies coming from Germany, Russia, and Spain. In some regions where ergot is abundant its presence

ERGOT.

Represented by the two black masses.

in grain often makes flour injurious unless the grain be thoroughly screened before grinding. The most conspicuous constituent of ergot is a heavy, nondrying, inflammable fixed oil, soluble in ether, which is present to the extent of 30 per cent or more. This is now considered as inert. There is also about 7 per cent of resin, which is of no medicinal value. It is claimed that two alkaloids have been isolated—ecbolin or cornutin 0.16 per cent, and ergotin 0.12 per cent—and that the active principles

are contained in these compounds, the former being much the more powerful. Dragendorff and Podwissotzky discredit the active properties of ecbolin and ergotin, believing them to be formed by chemical action and heat and not occurring in the ergot normally. They have found 4.5 per cent of sclerotic acid and 2 to 3 per cent of scleromucin in ergot, which they claim to be the principal active constituents. Sclerotic acid is an amorphous, yellowish-brown, inodorous, and tasteless substance, soluble in water, while scleromucin is darker and insoluble in water after once being dried. Another active principle is sclererythrin, which is present in small quantities. According to Kobert (*Lehrbuch der Toxikologie für Therapeuten*, 1890), the active constituents of ergot are cornutin (an alkaloid), sphacelic acid, and ergotic acid. The uterine contraction is due to the cornutin, while the poisonous properties of ergot, which often result in gangrene, are due to the sphacelic acid. The ergotic acid is a glucoside which has narcotic properties and diminishes and finally stops reflex excitability. Ergot is usually administered as a fluid extract of ergotin, which is made in various ways, as a wine of ergot, etc., and, as already stated, when used in considerable quantities is poisonous. See ASCOMYCETES.

ERGOT FUNGUS. See ERGOT.

ERGOTISM. A disease of cattle, horses, and sheep caused by eating toxic quantities of ergot on grasses (q.v.). The effects are impaired general vitality and circulation of the blood, which latter, usually in the legs, may stop entirely and be followed by swellings below the knee or hock, with perhaps subsequent death of, or gangrene in, the part. Less typical symptoms of a constitutional nature are indigestion, nervousness, dementia, stupor, coma, or twitching and paralysis of the voluntary muscles, beginning with the tongue and extending to other parts. Epidemics of ergotism have occurred in Europe, following cold, damp seasons, in which meteorological conditions favor the propagation of ergot. In such outbreaks not alone are domestic animals affected, but the ill-fed poor of cities have also suffered severely from eating bread made from infected grain. It has to be differentiated from mycotic stomatitis.

Treatment consists in a change of food, local antiseptics, tannin internally to neutralize the unabsorbed alkaloids of the ergot, and castor oil. Chloral hydrate may be given internally and hot water applied locally to dilate the blood vessels.

ERIC. The name of several kings of Sweden and Denmark, before and after the union of the two kingdoms in 1397.—Several Erics, mainly of legendary fame, are said to have ruled in Sweden before St. Eric, who is accordingly styled the ninth. Eric the Victorious, who died about 995, was the last heathen king and is styled the seventh Eric.—St. ERIC (c.1150–60) Christianized upper Sweden and built a number of churches and monasteries. He undertook a crusade against the Finns, which resulted in the long and intimate connection between the two countries. Eric also compiled an excellent code of laws known as St. Eric's Lag, which granted to women the right of inheritance of one-third and certain privileges within their households.—ERIC X (1210–16), grandson of St. Eric, is the first King mentioned as being crowned. For a time he had been an exile in Denmark.—

The most important events in the reign of ERIC XI (1222-50) were his enforced exile for five years; the successes achieved against the Finns; the imposition of celibacy on the clergy at the Synod of Skenninge in 1248, and the invasion of Russia, which was checked by Alexander Nevski. Under this King Birger Jarl, of the family of Folkungar, rose to be the virtual ruler in the state, and after the death of Eric the royal crown was placed upon Birger's son Waldemar.

In Denmark ERIC I (1095-1163) won the name of the "always good" by his excellent rule and character.—In the twelfth century ERIC EMUN (1134-37) waged continual war against his piratical neighbors, whom he sought to Christianize.—ERIC THE LAMB, a King of mild and gentle character, crippled the power and resources of the crown by his easy-going policy. He abdicated and retired to a cloister, where he died in 1147.—The three Erics (ERIC VI, VII, and VIII) who occupied the throne with only the intermission of a few years, from 1241 to 1319, are associated with one of the most disastrous periods of Danish history. Long minorities, the practice of dismembering the crown lands in favor of younger branches of the royal house, and a futile struggle between the ecclesiastical power and the state, weakened the crown to the last degree. Eric VI Plogpennig (1241-50), and Eric VII Glipping (1259-86), were both assassinated, the former at the instigation of a brother, and the latter in revenge for a private injury. Eric VIII (1286-1319), the last of the name before the union of Kalmar, died childless, and was succeeded by his ambitious brother Christopher, who lost his powers and prerogatives one by one, and was finally forced to flee from Denmark. Margaret, daughter of Waldemar IV of Denmark, by marriage with Hako, King of Norway, united the countries, and through her wise rule in those countries was enabled to secure the crown of Sweden also. By the union of Kalmar, in 1397, her nephew, ERIC of Pomerania, was recognized as her successor. On the death of Margaret, in 1412, Eric therefore became King of the triple kingdom of Scandinavia. His reckless disregard of treaties and oaths, his neglect of his duties, and his misdirected ambition, led to dissensions and maladministration. In consequence, in 1439, the Danes renounced their allegiance, and in the next year Sweden did the same. Denmark chose Christopher of Bavaria in his stead; but Scandinavia, for many years afterward, was a scene of intestine wars and dissensions, as a result of Eric's misrule. Eric fled to Gothland and for 10 years led the life of a pirate. He had married Philippa, daughter of Henry IV of England, a noble-spirited woman, whom it is said he treated cruelly. He died in 1459.

ERIC XIV, the last of the name who ruled in Sweden, was one of the weakest and most unfortunate of the Erics. He succeeded his father, Gustavus Vasa, in 1560. The kingdom was in an excellent condition as the result of the wise rule of his father. Eric was well educated, and a number of useful reforms were introduced in his reign. He made the first attempt to establish a supreme court and invited the oppressed Protestants to his land, many Huguenots accepting his offer. On the other hand, his fickleness and constant suspicion of others not only alienated the affections of his subjects, but

prevented the growth of a strong government. Elizabeth of England and Mary of Scotland were more than once the objects of his matrimonial schemes. Finally, he married his mistress, a Swedish peasant girl, who exercised great influence over him, especially during his attacks of insanity. The nobility at last rebelled, and the estates in 1568 deposed Eric and chose his brother John as King. Eric suffered the most rigorous confinement, and the frequent conspiracies to free him only made his lot the harder. To remove all danger, John caused his brother to be poisoned in 1577. See DENMARK; SWEDEN.

ERICA'CEÆ (Neo-Lat., from Gk. *ἐρείκη*, *ereiikē*, *ἐρίκη*, *erikhē*, heath). A family of dicotyledonous plants, the heath family, which consists chiefly of small shrubs, but which contains some trees. The leaves are alternate, opposite, or in whorls, entire, destitute of stipules, often small, in some genera mostly evergreen and rigid. The flowers are sometimes solitary in the axils of the leaves, sometimes grouped in different kinds of inflorescence, and are often of great beauty. The calyx is four or five parted, and the corolla, which is often bell-shaped, has four or five lobes. The stamens are as many or twice as many as the corolla lobes, and the anthers in most genera open by small pores at the summit. The ovary is four to five celled, and one to many seeded. The fruit is a capsule or a berry. About 50 genera and 1400 species are known, of which the greater number are natives of South Africa, which particularly abounds in species of the genus *Erica* and its allies, the true heaths. Some of them are also found at the utmost limits of northern vegetation. They are rare within the tropics and occur only at considerable elevations. Few species are found in Australia. Many of the *Ericaceæ* are social plants, and a single species sometimes covers a great tract, in which it constitutes the principal vegetation. This is most strikingly exemplified in the heaths of Europe and the north of Asia.

The family contains many well-known forms in North America, as the wintergreens (*Pyrola* and *Gaultheria*), the curious Indian pipe (*Monotropa*), trailing arbutus (*Epigæa*), bearberry (*Arctostaphylos*), huckleberries (*Gaylussacia*), blueberries and cranberries (*Vaccinium*), rhododendrons and azaleas (*Rhododendron*), mountain laurel (*Kalmia*), etc. See AZALEA.

ERICHSEN, *ēr'ik-sen*, SIR JOHN ERIC (1818-96). An English surgeon, born in Copenhagen. He received his medical education at the University College, London, and in Paris, and in 1844 became lecturer on anatomy and physiology at Westminster Hospital. In 1848 he became assistant surgeon, and in 1850 surgeon in charge of the University College Hospital, serving also as professor of surgery from 1850 to 1866, and Holme professor of clinical surgery from 1866 to 1875. He was president of the Royal College of Surgeons in 1880, was elected a fellow of the Royal Society in 1876, and was created a baronet in 1895. He is best known for his textbook on the *Science and Art of Surgery* (1st ed., 1853), which was translated into German, Italian, and Spanish, and is still considered one of the standard textbooks of surgery in the greater part of the world.

ERICT (*ēr'ikt*), Loch. A lake in the northwestern part of Perthshire and south of Inverness-shire, Scotland, in a wild, uninhabited

district, amid the Grampian Mountains (Map: Scotland, D 3). It is 14 miles long by $1\frac{1}{4}$ to $1\frac{1}{8}$ miles broad and its surface is 1153 feet above sea level. Its banks rise steeply from the water's edge. It empties into Loch Rannoch, and its waters ultimately reach the Tay. The lake is noted for salmon and trout. In a cave at the south end Prince Charles found safe concealment in 1746, after the battle of Culloden.

ERICHTHONIUS (Lat., from Gk. Ἐριχθόνιος). 1. The son of Dardanus and Batea, father of Tros, and ancestor of Æneas. 2. The son of Hephestus, identified with Erechtheus (q.v.).

ERICSON, LEIF. A probably historic personage whose adventures are described in the Icelandic sagas. He was the son of the Norseman Eric the Red and about 1000 A.D. discovered a land to the west, which he called Vinland (Vineland). The site of the early settlement has been variously placed along the Atlantic seaboard—on Labrador, on Newfoundland, and on the mainland farther south. Consult *The English Rediscovery and Colonization of America* (London, 1891).

ERICSSON, JOHN (1803-89). A distinguished engineer. He was born in the Parish of Fernebo, Vermland, Sweden, July 31, 1803. After serving for some time as an officer of engineers in the Swedish army, he removed in 1826 to England and continued to occupy himself with inventions, chiefly improvements in steam machinery. While in England Ericsson patented a new form of screw propeller, and it was largely through his efforts that the screw came to be generally adopted for navigation. The Admiralty and British naval engineers did not become interested in Ericsson's work; but his ideas were appreciated by F. B. Ogden, United States Consul at Liverpool, who placed at his disposal funds to construct a small ocean steamer, which was subsequently sent across the Atlantic. Mr. Ogden and Capt. Robert F. Stockton, U. S. N., induced the engineer to come to the United States, and he received the orders for the construction of two steamships. He arrived at New York in 1839, and two years afterward was employed in constructing the U. S. S. *Princeton*, which was the first war steamship to have its propelling machinery below the water line and to use the screw propeller. Ericsson soon became known for the great number and novelty of his inventions, among which, in addition to the screw propeller, were a steam boiler with artificial drafts which did away with smokestacks and effected an important saving in fuel; a steam fire engine; the calorific engine; a sliding telescopic chimney; machinery to check the recoil of heavy guns; an instrument for measuring distance at sea; the hydrostatic gauge for measuring the volume of fluids under pressure; a meter to measure the amount of water passing through pipes; an alarm barometer; a pyrometer to measure temperature, from the freezing of water to the melting of iron; a lead to take soundings without rounding the vessel to the wind; and various modifications of the calorific engine in which the expansive force of hot air was used as a source of power. In the Civil War he designed and built the monitors for the United States Navy. The first one was built in a little more than three months and (March 9, 1862) defeated and disabled the Confederate ironclad *Merrimac*. In his later years he attempted to perfect the solar engine, for which heat is ob-

tained from the rays of the sun collected by a huge funnel lined with a reflecting surface. He died in New York, March 8, 1889. In 1890 the body of Ericsson was removed to Sweden, being conveyed by the United States cruiser *Baltimore*, and in 1893 the State of New York erected a monument to him on the Battery, New York City. This was replaced by another in 1901. Consult Church's *Life of Ericsson* (New York, 1890).

ERICSSON, NILS (1802-70). A Swedish engineer. He was born in Stockholm and was the eldest brother of John Ericsson, who built the *Monitor*, the first successful ironclad in the United States navy. In 1830 he was appointed colonel of the Naval Engineering Corps, and in 1858 became director of government railroad construction, in which capacity he probably contributed more than any other man to the development of the present railroad system of Sweden. As a hydraulic engineer, he constructed the docks at Stockholm, the great canal uniting Lake Saima with the Gulf of Finland, and the new sluices of the Trollhättan Canal.

ERIC THE RED (c.950-1000). The colonizer of Greenland. He was a native of Norway and fled from the country under a charge of homicide, settling on the west coast of Iceland. Another murder forced him (c.980) to flee to an island in the west which had been discovered more than a century before, but not settled. In 985 Eric returned to Norway and secured colonists for the new land, which he called Greenland. He became the leading man of the colony and called his chief town Gardar. His son, Leif Ericson (q.v.), introduced Christianity and is supposed to have landed on the New England coast about the year 1000. Eric has by some been credited with the discovery of America. In the eleventh century Greenland became tributary to Norway. After flourishing for about four centuries the settlement suddenly disappeared from history, all communications, commercial and otherwise, being mysteriously broken off. It is sometimes supposed that all of the people were carried off by the black death in the fourteenth century. Consult Nansen, *In Northern Mists* (2 vols., New York, 1911).

ERIDANUS, ἑ-ρίδ'ά-νους (Gk. Ἐριδανός, Eridanus, a river god, son of Oceanus and Tethys). An ancient southern constellation, mentioned by Eudoxus in the fourth century B.C. It lies immediately south of Taurus and extends more than halfway to the south pole. Its principal star, α *Eridani*, or Achernar, is of the first magnitude. ο₂ *Eridani*, a star of magnitude 4.5, has a faint and distant double satellite, and was first recognized as a triple system by Herschel in 1783; it is remarkable also for its large proper motion.

ERIDANUS. See **ELECTRIDES**; **Po**.

ERIE. A city and the county seat of Neosho Co., Kans., 120 miles south-southwest of Kansas City, on the Missouri, Kansas, and Texas, and the Atchison, Topeka, and Santa Fe railroads (Map: Kansas, G 7). It is in the valley of the Neosho, the centre of a fertile agricultural region, and has a large oil refinery, an ice factory, a mineral-water plant, grain elevators, and feed mills. There are natural-gas and oil wells in the vicinity. The water works and electric-light plant are owned by the city. Pop., 1900, 1111; 1910, 1300.

ERIE. A manufacturing city, port of entry,

and the county seat of Erie Co., Pa., on Lake Erie, 88 miles by rail southwest of Buffalo, N. Y., and 95 miles northeast of Cleveland, Ohio (Map: Pennsylvania, A 1). The city's supplies of natural gas and its proximity to the bituminous coal and coke districts of the State greatly enhance its commercial and industrial importance. The only lake port in Pennsylvania, Erie has an excellent harbor, protected by a peninsula 6 miles long and 1 mile wide, called Presque Isle. It receives a large part of the shipping of the Great Lakes and is also important as a railroad centre, being on the Bessemer and Lake Erie, the Lake Shore and Michigan Southern, the New York, Chicago, and St. Louis, the Pennsylvania, and other railroads. Its lake freight commerce carries products valued at more than \$150,000,000, in 3000 American and foreign vessels annually, while its railroad freight tonnage is equivalent to 200,000 loaded cars. Besides the trade in coal and iron ores, there are extensive fisheries and a heavy commerce in grain, package freight, and agricultural products.

Erie's manufactures are considerable and varied. They give employment to about 15,000 men and represent an invested capital of \$36,094,500. The annual output is valued at more than \$30,000,000. The principal industrial establishments include engine and boiler works, blast furnaces, electrical-cars and machinery factories, iron, brass, and aluminium foundries, machine and tool shops, malleable-iron works, refineries, chemical works, tanneries, horseshoe and hardware plants, paper, flour, silk, and woolen mills, and manufacturing of bicycles and automobiles, pianos and organs, beer, cigars, tobacco, medicines, etc. The city has many beautiful parks, a public library, three general hospitals, a sanitarium, eight homes for children and aged persons, a Federal building, a courthouse, a city hall, St. Benedict and Villa Maria academies, two cathedrals, St. John Kanty College, and a State soldiers' and sailors' home, whose park near the harbor entrance is the site of the old French and Indian War frontier blockhouse fort, where Gen. Anthony Wayne died in 1796. Erie, under a charter of 1913, is governed by a municipal commission of the mayor and four commissioners. These, with the city controller, are elected by popular vote on a nonpartisan ticket. Other officials are chosen by the commission, excepting the board of municipal waterworks, which is appointed by the judges of the county court of common pleas. Legislative initiative by 100 qualified voters and referendum by petition of 20 per cent of the electors are provided. The school affairs are managed by a board of nine directors, elected by popular vote. The city's receipts in 1914 were \$1,100,000, while its payments amounted to about \$1,337,000, the principal items of expense being \$490,000 for schools, \$115,000 for the fire department, and \$100,000 for the police. The water works, valued at \$3,520,000, and having a pumping capacity of 44,000,000 gallons daily, are owned by the municipality and operated at a yearly expense of \$120,000. The assessed property valuation of the city in 1913 was \$48,513,000.

On the site of Erie stood the old French fort, Presque Isle, built in 1753. In 1760 the English took possession of it, and on June 22, 1763, during Pontiac's War, a large force of Indians compelled the garrison to surrender. Erie was

the headquarters of Commodore Perry in the War of 1812, and the two flagships, the *Lawrence* and the *Niagara*, with which he defeated the British in the naval battle of Lake Erie, off Put-in-Bay, were built and equipped here. The town was laid out and settled in 1795 by families from New England and was chartered as a city in 1851. Pop., 1900, 52,733; 1910, 66,525, including 14,943 of foreign birth and 340 negroes; 1914 (U. S. est.), 72,401; 1920, 93,372.

ERIE. An Iroquoian tribe, formerly holding the east and southeast shores of the lake of that name, in the present States of New York, Pennsylvania, and Ohio. They were nearly destroyed by the Iroquois about 1650, in a short but fierce war of conquest, those who survived being incorporated with the Senecas. The name is said to signify a wildcat.

ERIE, BATTLE OF LAKE. A famous naval engagement in the War of 1812, between Great Britain and the United States, fought in Put-in-Bay, near the western end of Lake Erie, on Sept. 10, 1813. The American fleet, which had been hastily built at Presque Isle (now Erie), Pa., consisted of 3 brigs, 5 schooners, and a sloop, with a total of 54 guns, throwing a broadside of 936 pounds, and 400 officers and men. The British had 2 ships of war, 2 brigs, a schooner, and a sloop, mounting 63 guns, throwing a broadside of 459 pounds, and carrying about 460 officers and men. The American guns, though of heavier calibre, were of shorter range than those of the British. The American commander was Oliver Hazard Perry, then ranking as master commandant; the British commander was Robert H. Barclay, who had served under Nelson at Trafalgar. During the first part of the battle the English concentrated their fire on Perry's flagship, the *Lawrence*, which was soon so completely disabled that Perry left her in command of Lieutenant Yarnall and shifted his flag to the *Niagara*, under a heavy fire. The action now became general, and after a stubborn contest Perry forced Barclay's flagship, the *Detroit*, and three other vessels to surrender. The remaining two attempted to escape, but were soon overtaken and captured. Perry at once sent his famous dispatch to General Harrison: "We have met the enemy, and they are ours—two ships, two brigs, one schooner, and one sloop." The battle lasted three hours and fifteen minutes, and during this time the Americans lost 123 in killed and wounded; the British, 135. This victory gave the Americans almost undisputed control of the upper lakes, and not only removed all danger of invasion in that quarter, but virtually insured the recapture of Detroit and the conquest of Upper Canada by the American army under General Harrison. Gold medals were conferred by Congress upon Perry and Master Commandant Elliott, and minor rewards upon the other officers and men. In 1858 the remains of the officers killed were buried on Put-in-Bay Island. There has been much discussion among naval historians in regard to the relative strength of the two fleets and the precise amount of credit to be awarded to Perry. See **PAGEANTS AND CELEBRATIONS** for account of Centennial Celebration. Consult: Roosevelt's *Naval War of 1812* (New York, 1882); Spears, *The History of Our Navy* (ib., 1890); Maclay, *History of the Navy* (ib., 1894-1901); Mills, *Oliver Hazard Perry and the Battle of Lake Erie* (Detroit, 1913).

ERIE, LAKE. The most southern of the chain

of five great lakes drained by the St. Lawrence River (Map: United States, Eastern Part, K 2). It lies between Lakes Huron and Ontario, receiving waters from the former through the St. Clair River, Lake St. Clair, and the Detroit River on the west, and discharging its waters into the latter through the Niagara River on the east, at the rate of 215,000 cubic feet per second. Lake Erie has a length of about 250 miles, in a northeast and southwest direction, and a maximum breadth of 57 miles. Its surface, which has an area of 9600 square miles, is 573 feet above the level of the sea and 326 feet above Lake Ontario; its mean depth is about 100 feet, and the greatest depth recorded is 210 feet. It is the shallowest of the Great Lakes. Lake Erie is bounded on the north by the Canadian Province of Ontario, on the east and south by New York, Pennsylvania, and Ohio, and on the northwest by Michigan, the boundary between the United States and Canada traversing it. Besides receiving the drainage from Lakes Superior, Michigan, and Huron, it has a limited river system of its own, receiving among others the Grand from the north, the Maumee from the west, and the Sandusky and Cuyahoga from the south. The chief islands belonging to the United States are West Sister, Rattlesnake, Green, Put-in-Bay, Bass, and Kelly. Those belonging to Canada are Middle Sister, East Sister, The Chickens, Middle, and Pellee.

Navigation on Lake Erie is rendered somewhat difficult, its comparative shallowness making it liable to a heavy ground swell. Navigation is suspended wholly or in part during the winter season on account of the ice. Lake Erie is connected with Lake Ontario by the Welland Canal, around Niagara Falls, with the Hudson River by the Erie Canal, and with the Ohio River by the Miami and Erie and Ohio and Erie canals. Several large cities and important ports are situated on Lake Erie, chief of which are Buffalo, Erie, Cleveland, Sandusky, and Toledo; and Detroit, on the Detroit River, may be added to this list. The growth of these cities—of Cleveland, Detroit, and Buffalo—has been remarkable. The commercial importance of Lake Erie has had rapid increase, as it forms a link in the waterway from the West to the East, over which a great grain and iron movement takes place. Numerous large freight steamers and magnificently equipped passenger steamers ply upon its waters. Lake Erie was an important theatre of naval warfare in the War of 1812. See **ERIE, BATTLE OF LAKE; GREAT LAKES.**

ERIE CANAL. An artificial waterway across the State of New York, extending from Buffalo to Albany, connecting the Great Lakes with the Hudson River. This canal, second in length only to the great canal of China, among the artificial waterways of the world, played a most important part in the commercial development of the State of New York, and probably more than any other influence contributed to the establishment of New York City as the great port and commercial centre of the eastern coast of the United States. In 1784 Christopher Coles made a survey of the Mohawk valley and submitted plans to the New York Legislature for the connection of the Hudson River and Lake Ontario by an artificial waterway. Another survey was made in 1791 by the direction of the Legislature through the efforts of Governor George Clinton, and in 1792 the Western Inland

Canal Company was chartered. By the end of 1796 this corporation had built 6 miles of canal at Little Falls to facilitate the use of the upper Mohawk River, and this waterway was navigable by vessels of 16 tons. In 1816 Governor Tompkins urged that the canal be built by the State, and a canal commission, with De Witt Clinton at the head, was appointed. On April 15 the Legislature authorized the construction of a canal, and on July 4 ground was broken at Rome. In October, 1819, a section of the canal from Rome to Utica was open for navigation, and in the following year Seneca Lake was reached. On Oct. 26, 1825, the first canal boat, *Seneca Chief*, left Buffalo for New York, and navigation from the Great Lakes to tidewater was established. The actual cost of the canal was \$7,143,780, but by 1836 it had turned into the State treasury more than its cost.

The Erie Canal, as built, was 352 miles in length, with 9 miles of adjuncts, and, considering the time of its construction, was marked by excellent and efficient engineering. It immediately became a source of direct profit to the State, as well as an economic asset of high importance. From 1817 to 1882, when tolls were abolished, the gross revenues of the Erie Canal were \$121,461,871, while the cost of operation and maintenance amounted to \$20,270,301, showing a profit of \$92,191,570. The cost of construction and enlargement in the same period aggregated \$40,501,853; so a profit of \$42,590,718 was shown. The ratio of operation and maintenance to revenues was 24 per cent. In 1825 the tolls amounted to \$566,112, and from the time of its completion the tonnage of freight carried annually soon increased to over 1,000,000 tons, and by 1836 1,301,000 tons were carried. The charge for transportation from Buffalo to Albany, which had been \$22 in 1824, fell to \$4 per ton in 1835. The original Erie Canal floated boats of 80 feet in length, 15 feet in width, and 3½-foot draft, with a maximum burden of 75 tons; but soon increased capacity was demanded, and in 1835 the enlargement of the canal was authorized. From this time on, politics played an even greater part in the operation and maintenance of the canal. The canal ring was born (see *NEW YORK, History*) and the vast expenditures for maintenance and enlargement led to great corruption and waste. In 1831 the Mohawk and Hudson Railroad opened its line, the era of steam transportation was inaugurated, and 10 years later Albany and Buffalo were connected by rail; but no effect on the business of the canal was felt between 1838 and 1847. In 1848 the State constitution was revised, and from that time on in numerous amendments the question of the canal was more or less before the people. Canal enlargement by 1849 had made passage for vessels of 100 tons burden, and by 1853 vessels of 200 tons could be accommodated. At this period constant efforts were in progress to effect further enlargement of the canal, which by 1862 was virtually completed. The canal was 70 feet wide at the surface, 52 feet wide at the bottom, 7 feet in depth, and accommodated vessels of 6-foot draft and 240 tons, capable of a load of 8000 bushels of wheat, as compared with 1000 bushels at the primitive stage and 2500 bushels from 1830 to 1850. Naturally the cost of maintenance and operation increased with the enlargement and with the inefficiency resulting from political control. In 1867 the land trans-

portation lines begun to benefit from increased commercial activity in much greater ratio than the canal, and after the consolidation of the New York Central and Hudson River railroads, in 1869, the advantages of the canal for long hauls were beginning to be lost. The railroads assumed an attitude of opposition to the canal and political influence was wielded against improvements and enlargement, with the result that the Erie Canal began to be neglected, and a lamentable lack of foresight was shown. The canal ring, by this time, had become a public scandal of serious dimensions, and in 1875 it was broken up through the efforts of Gov. Samuel J. Tilden (q.v.). Although the tolls were lowered after the financial crisis of 1873 and were abolished in 1882, the decline of the canal business set in and from about 1880 became phenomenal. With the abolition of tolls came increased neglect, and in no way was the Erie Canal kept abreast of the times, or received the intelligent care and interest such as at this time were given to European canals. Little or nothing was done in the way of improvement until 1895, when an expenditure of \$9,000,000 was authorized providing for the deepening of the canal to 9 feet. This amount was entirely inadequate, and the improvement effected was slight, so that after considerable agitation, in 1903, the enlargement of the canal was submitted to the people and its increase in size to accommodate 1000-ton barges was duly voted. This opened a new chapter, both in the engineering and economics of the matter, which will be found discussed under NEW YORK STATE BARGE CANAL. Consult: Hepburn, *Artificial Waterways and Commercial Development*, with history of the Erie Canal (New York, 1909); annual reports of the Superintendent of Public Works of the State of New York; and various reports of canal commissions and committees.

ERIE SHALE. A name given to the westerly extension into Ohio of the Upper Portage and Chemung rocks of New York. It overlies the Huron shale, the latter being the storehouse of petroleum. See DEVONIAN SYSTEM.

ERIGENA, ɛ-rí-jé-ná, JOHANNES SCOTUS. A famous mediæval philosopher, who was born probably of Scot parentage in Ireland (whence *Scotus*, Scot, and *Erigena*, Irish-born) within the first two decades of the ninth century. Very little is known regarding his history. He was called to France by Charles the Bald, who intrusted to him the translation of the writings ascribed to Dionysius the Areopagite (q.v.), his publication of which, without prior submission to the censorship of Rome, brought him into conflict with Pope Nicholas I; but evidently Charles stood by him, since he remained at the French court till the death of the King in 877. Nothing is known of Erigena's history after that date. His philosophic opinions were those of a Neoplatonist rather than of a scholastic. He held that God is the essential ground of all things, from whom all things emanate, and into whom they return again. Nature he regarded as of four distinct sorts: first, the creative and uncreated; second, the creative and created; third, the noncreative and created; fourth, the noncreative and noncreated. The first is God the Creator; the second is the world of ideas existing in God's mind and giving rise to the world of space and time, which is the third; while the fourth is God again as the final goal and consummation of all development. The church doctrine

of creation out of nothing he completely changes by making "nothing" mean reality in so far as unknown. God eternally creates the world out of Himself, the Unknown. In logic he was a realist; creation of individual things seems to be nothing but logical subordination of the particular to the universal. As can be seen from this short account of his views, he was not an authoritarian, but insisted that "authority originates in reason, not reason in authority. All authority which is not confirmed by true reason seems to be weak," whereas reason "does not need to be corroborated by the seal of any authority." Erigena took active part in the theological polemic of his day, maintaining the spiritual presence in the Eucharist, and denying Gottschalk's twofold predestination, i.e., both to salvation and to damnation, and admitting only the former. Erigena's main work, his *De Divisione Naturæ*, was condemned by the Provincial Council of Paris in 1210 and ordered by Honorius III in 1225 to be burned. It was first printed in Oxford, 1681. *De Divina Predestinatione* was printed first in Paris, 1650. His complete extant works were edited by Floss and published in Migne's *Patrologie Coursus Completus* (Paris, 1853). Consult: the histories of mediæval philosophy by Haureau, Stöckl, Kaulich, Picavet; Christlieb, *Leben und Lehre des Johannes Scotus Erigena* (Gotha, 1860); Huber, *Johannes Scotus Erigena* (Munich, 1861); Buchwald, *Der Logosbegriff des Johannes Scotus Erigena* (Leipzig, 1884); Wotschke, *Fichte und Erigena* (Halle, 1896); Kaulich, *Geschichte der scholastischen Philosophie* (Prague, 1863); Poole, *Mediæval Thought* (London, 1884) and *Erigena* (ib., 1896); Gardner, *Studies in John the Scot* (ib., 1900); Rand, "Johannes Scotus," in *Quellen und Untersuchungen zur lateinischen Philologie des Mittelalters* (München, 1906); Whittaker, *Apollonius of Tyana and Other Essays* (London, 1906).

ERIGERON, ɛ-rí-jé-rôn (Lat., from Gk. ἔριγερων, *erigerôn*, the plant groundsel, from ἔρι, *eri*, early, + γέρων, *gerôn*, old). A genus of plants of the family Compositæ. It has a powerful odor, which is said to keep away fleas, and the name "flea-bane" is sometimes given to the plant. *Erigeron philadelphicus*, with pale-purple ray and a fetid smell, and *Erigeron canadensis*, with inconspicuous rays, are valued in the United States as diuretics. The latter species is now widely diffused throughout the world. The principal constituent of the oil which is distilled from these species is terpene. The oil is a strong hemostatic, irritant, and stimulant, and is valuable in cases of uterine hemorrhage, diarrhœa, and dysentery.

ERIN (Óir. *Hériu*, *Eriu*, gen. sg. *Erenn*, dat. sg. *Erinn*, appearing in Gk. as Ἰωνεῖν, *Ivernía*, and in Lat. as *Hiberio* or *Hibernia*; cf. Welsh *Ywerddon*, MBret. *Ywerdon*; perhaps ultimately connected with Skt. *pívan*, fat, rich, Gk. ἱ(Ϝ)εpla, *Pi(v)eria*, name of a district in Greece). The ancient name now employed poetically for Ireland (q.v.).

ERIN GO BRAGH, bráñ (Óir., Ireland forever). The old war cry of the Irish.

ERINNA (Lat., from Gk. Ἑριννα). A Greek poetess of uncertain date. On the basis of a statement in Suidas she has generally been regarded as a contemporary and friend of Sappho, but Reitzenstein in *Epigramm und Skolion* (Giessen, 1893) has shown it to be probable that Suidas's statement is due to the fact that

Erinna wrote songs which were imitations of those of Sappho. Her most probable date is the early Alexandrian period. Among her poems the most famous was "The Distaff" (*Ἡλεκάρη*, *Elakātē*), in 300 hexameters. The fragments of her works are edited by Bergk, *Poetae Lyrici Graeci*, iii (Leipzig, 1900 et seq.). Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i (5th ed., Munich, 1908).

ERINYES, ἑρινύες. See EUMENIDES.

ERIOBOTRYA. See LOQUAT.

ERIODENDRON (Neo-Lat., from Gk. ἔριον, *erion*, wool + δένδρον, *dendron*, tree). A genus of trees of the family Malvaceae, or Bombacaceae according to Engler, natives of tropical countries. The thick, woody seed capsules contain a kind of fibre which resembles cotton, from which the trees are called silk cotton. *Eriodendron anfractuosum*, found in the East Indies, Africa, and also South America, is a tree which reaches a height of 130 feet or more. The African variety or species is called rimí and bentang. Park mentions it by the latter name. Barth says it is generally to be seen growing near the principal gate of large towns in Haussa. Its wood, soft and spongy, is chiefly used for making canoes. The roundish seeds, of the size of peas, are eaten in Celebes. The trees of this genus have palmate leaves and large, beautiful flowers. On account of its shortness, elasticity, and brittleness, the fibre cannot be spun like cotton. It is, however, valuable in various ways in upholstery and is used for making floss. The principal supplies come from Java, although the tree is common throughout nearly all tropical regions. In Java it is known as kapok. The silky and lustrous fibre of *Eriodendron samauma* is used in Brazil for stuffing pillows and has been made into many articles. It is said to be a good substitute for beaver in the manufacture of felt hats. Very similar to *Eriodendron* are the species of *Bombax*, a related genus. *Bombax ceriba*, or *Ceiba pentandra*, and *Ceiba munguba* are Brazilian trees of large size. *Ceiba malabarica* is an East Indian species, the fibre of which is reddish; hence the tree is called the red silk-cotton tree. The fibre of these three species is used only for stuffing pillows. It is said that all of them would make good paper. Valuable bast fibres used in making ropes are found in the bark of all species.

ERIPHORUM. See COTTON GRASS.

ERIPHYLE (Lat., from Gk. Ἐριφύλη). In Greek mythology, sister of Adrastus, wife of Amphiaraus, and mother of Alcmaeon. When Polynices, son of Oedipus, resolved to wage war against his brother Eteocles and so to gain control of Thebes, he bribed Eriphyle with the necklace of Harmonia to persuade Amphiaraus to take part in the expedition. Amphiaraus, who knew that he would die on the expedition, enjoined his sons to kill their mother Eriphyle as soon as they heard of his death. For the execution of this command see ALCMÆON.

ERIS (Lat., from Gk. Ἔρις). In Greek mythology, the sister of Ares, in the *Iliad*, and daughter of Nyx (night), in Hesiod. Eris, or "strife," is represented by Homer as at first insignificant, but growing until her head touches the heavens. According to the late poets it was Eris who at the marriage festival of Peleus and Thetis fung on the table the golden apple inscribed "To the fairest," for which Hera, Athena, and Aphrodite contended, and which thus brought about the Trojan War. (See

PARIS.) The Latin writers give Eris the name of Discordia (q.v.). Hesiod knew another and very different Eris, who spurred men on to honorable rivalry.

ERITH (AS. *Ære-Hybe*, Old Haven). A town of Kent, England, on the south bank of the Thames, 14 miles east by south of London (Map: London, E 11). It is a favorite suburban residence and a popular starting point for yacht races. In the neighboring marshes are large powder factories. The town owns its electric-light and tramway system and operates them at a profit; it also owns its sewage-disposal plant, a steadily growing group of workmen's dwellings, and in 1909 opened a central store. Pop., 1901, 25,300; 1911, 27,755.

ERITRE'A, It. pron. èrè-trä'a, or **ERYTH-RÆA**. An Italian colony in northeast Africa, lying between the Red Sea on the northeast and Abyssinia on the southwest, and between Anglo-Egyptian Sudan on the northwest and French Somaliland on the southeast, and embracing the northern part of the Abyssinian highlands (Map: Africa, H 3). The coast is about 650 miles long and occupies about one-fourth of the west coast of the Red Sea. The southern portion is a comparatively narrow strip of territory extending inland about 50 miles. The northern section, north of Annesley Bay, extends inland about 200 miles at its greatest width. The colonial territory includes the islands Massawa, Dahlak, and Hauakil in the Red Sea. The total area is approximately 60,000 square miles. Generally speaking, Eritrea consists, first, of the narrow coast territory, which is of coral formation; next, a "subalpine" region with an average elevation of about 2500 feet; and then of a plateau 7000 feet high, broken by arid valleys. These highlands are the most healthful and habitable section of the country and the most susceptible of cultivation, while the sea region is altogether arid and ill capable of supporting life, whether fauna or flora. In this latter district the only rains are in winter. The climate of Eritrea is equatorial, the temperature at Massawa on the Red Sea having an annual average of nearly 90° F. and often rising to 120° F. in the shade. The exports embrace precious metals, animal products, especially hides, mother-of-pearl, pearls, coffee, and ivory. The imports include cotton goods, durra, cattle, wood, wine, and flour. The total value of the imports in 1912 was \$3,637,000, for use in the colony, and about \$1,000,000 of transit trade; exports, \$1,750,000. The imports and exports are almost exclusively at Massawa. There is a considerable transit trade with Abyssinia and Sudan. There entered and cleared, in 1912, 1408 vessels registering 204,400 tons. The only railroad is 75 miles long, connecting Massawa with Asmara, an interior town, the seat of government. This railway was constructed chiefly for military purposes. Additional lines of about 75 miles are under construction, connecting Asmara with other points in the interior. There are about 900 miles of telegraph lines. The seat of colonial government is at Asmara. The chief town is Massawa (q.v.), with a population of 7800 in 1912, the real business centre of the colony and the natural port for Abyssinia. The colony demands annually about \$1,250,000 from the national budget. A special army corps of about 4500 men, mostly natives, is stationed here. The population numbers 275,000 natives and 4000 Europeans. The natives are of the

Arab race and chiefly nomadic. The Afar or Danakil tribes inhabit the southern part. The Eritrean frontier was determined by treaties in 1900 and 1902, involving Italy, Abyssinia, and Great Britain. The foundation of this Italian colony began with the purchase in 1870 by an Italian steamship company of Assab as a coal-station, and it was later made an Italian colony. Subsequently treaties were made with the native rulers of other adjacent areas, and they were in 1890 united by royal decree under the title of Colony of Eritrea.

History. Italy, with the consent of Great Britain, obtained a footing in the district of Assab Bay in 1881 and in the next year formed a colony there. In 1885 it occupied the ports of Bailul and Massawa and their contiguous districts, and declared its protectorate over the coast from Ras Kasar to Beheta Bay. A contest with Abyssinia arose in consequence, and the Italian troops were finally forced back upon Massawa in 1887. In 1888 and 1889, however, the Italians regained their position and extended their dominion. After the Italians had with difficulty become possessed of Tigré and other sections, their army was disastrously defeated east of Adowa, on March 1, 1896, by the Abyssinians, to whom was surrendered as a result, under the Treaty of Oct. 26, 1896, all the region south of the Mareb, Belesa, and Muna rivers. In 1897 Kassala was given up to the Anglo-Egyptians. Up to 1898 Eritrea was a purely military department. The Abyssinian success in the war with Italy led her to set up a civil government. By three boundary conventions in 1900, 1902, and 1908 the boundary was finally fixed at approximately 60 kilometers inland. Signor F. Martini (1898-1906) put Eritrea on a sound commercial and financial basis, which continues to exist to-day. Consult Ostini, *La nostra espansione coloniale e l'Eritrea* (Rome, 1913).

ERIVAN, ər'i-vān' (Pers. *Revān*). A fortified city of Russian Armenia, capital of the Transcaucasian government of Erivan (q.v.), situated at an elevation of over 3000 feet on the Zanga, an affluent of the Arars, 172 miles southwest of Tiflis. It is divided into several parts and is commanded by a fortress situated on a hill (Map: Russia, F 6). The surrounding country has numerous gardens, but it is extremely unhealthy in the summer. Erivan contains five mosques and an Armenian theological seminary. Of interest is the palace of the former Persian viceroys. Leather, pottery, and cotton goods are the chief manufactures. The neighborhood of the city is rich in minerals. The town is an important military station on account of its position near the frontier. Under the rule of the Persians and the Turks, to whom the city belonged alternately, Erivan was of great military importance and was strongly fortified. It was attacked during the Russo-Persian War by the Russians under General Paskovitch (hence his surname Erivanski), and by the Peace of Turkmanchai (Feb. 22, 1828) was formally ceded to Russia. Pop., 1911, 32,505.

ERIVAN. A government in the southern part of Transcaucasia, Russia, bordering on Persia and Asiatic Turkey on the south and covering an area of 10,725 square miles (Map: Russia, F 6). It is a mountainous country, traversed by chains belonging to the Little Caucasus system. There are also isolated peaks, among which Alaghez and Ararat (on the border) are the

highest. The government belongs chiefly to the basin of the Aras, which forms the boundary line between Russia and Persia. The largest lake of Caucasia, Goktcha, is situated in the Government of Erivan. The climate varies with the elevation of the surface, but is, on the whole, unpleasant. The forest area is very limited, and salt is practically the only mineral exploited. The lower portions of the country and especially the river valleys are devoted to agriculture, while in the mountainous regions livestock breeding is the chief pursuit. Besides cereals there are raised large quantities of southern fruit and some cotton. Some leather and cotton goods are manufactured. Lake Goktcha has extensive fisheries. The trade is important and carried on mostly by Armenians and Tatars. Pop., 1912, 971,290, consisting principally of Armenians and Tatars, but including also Kurds, Russians, Greeks, and Jews. Capital, Erivan (q.v.).

ERJISH DAGH, ər'jish' dāg' (anciently, Lat. *Argæus*). An extinct volcano in Asia Minor, situated in the Vilayet of Angora, south of Kaisarieh. It has an altitude of over 13,000 feet, and its latest eruption took place in the fourth century.

ERK, ərĕk, LUDWIG CHRISTIAN (1807-83). A German musician. He was born at Wetzlar and was a pupil of A. André at Offenbach. He was appointed conductor of liturgical singing in the Domkirche at Berlin and founded the Erk Münnergessangverein in 1843 and the Erk Gesangverein in 1852. As a teacher he trained many excellent singers, and as a conductor he greatly increased the appreciation of good music among the masses. His popular song books for schools include the following: *Singvogelcin* (1896); *Liederkrans* (1839 et seq.); *Deutscher Liederschatz* (5th ed., 1893); and *Turnerliederbuch*. His valuable library and many of his unpublished manuscripts were acquired by the Königl. Hochschule für Musik at Berlin. A large number of these manuscripts, containing hundreds of liturgical and folk songs, consisting of original compositions and historical collections, were subsequently published by Magnus Bühme.

ERLACH, ər'lāk', Ger. pron. ər'lāc. A well-known Swiss family, distinguished in the history of Bern.—WALTER VON ERLACH took his name from the village of Erlach near the lake of Brienz. He lived in the twelfth century.—RUDOLPH VON ERLACH (?-1300) fought in the battle of Laupen (1339). An equestrian statue of him stands in the city of Bern. His descendant, JOHANN LUDWIG VON ERLACH (1595-1650), played a distinguished part in the Thirty Years' War as a commander on the Protestant side. Bernhard of Weimar appointed him, in 1638, commandant at Breisach. On the death of Bernhard, in 1639, he entered the French service. He took a prominent part in the battle of Lens under Condé and died a marshal of France.—JEAN LOUIS (1595-1650) was a descendant of another branch of the family. He fought against Germany (1648) and was made a marshal of France in 1650. Several other members of this family afterward achieved distinction as soldiers. Those best known are: HERONYMUS VON ERLACH (1667-1748), in the French and then in the Austrian service, and KARL LUDWIG VON ERLACH (1746-98), who served in the French army and then in the Swiss.

ERLANGEN, ər'lāng-en. A Bavarian town on the Regnitz, about 15 miles north-northwest

of Nuremberg (Map: Germany, D 4). It consists of the irregularly built old town and the modern handsome new town. The latter was founded in 1686, and assigned by the Margrave Christian Ernst of Brandenburg-Bayreuth to the Protestant refugees who were compelled to flee from France on the revocation of the Edict of Nantes. From that time many new branches of industry have been introduced into the town. It has a modern sewerage system and owns water and gas works and a slaughterhouse. Chief among its educational institutions are a nurses' school, the university, built on the site of an old castle (see **ERLANGEN, UNIVERSITY OF**), and the gymnasium, founded in 1745. The principal manufactures are cotton and woolen goods, wood, glass, tin foil, writing paper, paper boxes, electrical instruments, brushes, metal ware, flour and meal, horn and ivory ware, and gloves. Its breweries are also of importance. Pop., 1900, 22,953; 1910, 24,874. For a period of two centuries and a half after the Reformation Erlangen belonged to the margraves of Bayreuth. In 1791 it became Prussian and in 1810 Bavarian.

ERLANGEN, UNIVERSITY OF. A German university founded in 1742 at Bayreuth, whence it was moved to Erlangen in the following year, and replaced a *Ritterakademie* established in 1699. The patronage of the margraves of Bayreuth, particularly that of Alexander (1769-92), resulted in the refounding of the institution on a much broader basis, under the title it now bears, the Friedrich-Alexander University. It shared the fortunes of the margraviate in the revolutionary and Napoleonic wars and passed successively into the hands of Prussia, France, and finally Bavaria, between 1791 and 1810. About the time of the last transfer the University of Altdorf was united with it, and from that time till about the year 1880 it passed through the usual history of small German universities, distinguished for its strongly Lutheran tendencies. Since that time, however, it has enjoyed great prosperity. New buildings have been added, and the number of its students has more than doubled, there being in 1913 an enrollment of 1360. The library contains 254,000 bound volumes, some 300,000 pamphlets and dissertations, and 2400 manuscripts. Consult: Engelhardt, *Die Universität Erlangen, 1743-1843*; Kolde, *Die Universität Erlangen unter dem Hause Wittelsbach, 1810-1910* (Erlangen, 1910); *Minerva* (Strassburg, 1890 et seq.).

ERLANGER, ər'läng-ər, ABRAHAM LINCOLN (1860-). An American theatrical manager, born at Buffalo, N. Y., and educated in the Cleveland (Ohio) public schools. He became a member of a number of theatrical firms and possessed interests in various other amusement companies and corporations. His firms, as part of the so-called "Theatre Trust," gained control of leading theatres in the United States. The Shubert Brothers' interests were incorporated with his in 1907, but were subsequently withdrawn.

ERLANGER, ər'län-zhā', CAMILLE (1863-). A French composer, born in Paris. In 1880 he entered the Paris Conservatory, where his teachers were Mathias (piano), Bazille and Delibes (composition). He won the Prix de Rome in 1888 with the cantata *Velléda*. This was followed by a number of orchestral works, and in 1894 his dramatic legend *Saint Julien l'Hospitalier* attracted considerable attention.

His first opera was *Kermaria* (1897), the success of which was completely eclipsed by *Le juif polonais* (1900). After that he wrote *Le fils de Véroline* (1904), *Aphrodité* (1906), *Hannele* (1908), *Noël* (1911; produced at Chicago in 1913), *La Sorcière* (1912), and *Gioconda* (1914). He also wrote an impressive Requiem and a symphonic poem, *Maître et serviteur*.

ERLANGER, JOSEPH (1874-). An American physiologist. He was born at San Francisco, Cal., and was educated at the University of California (B.S., 1895) and at Johns Hopkins University (M.D., 1899). Subsequently he was resident house officer in Johns Hopkins Hospital, and fellow in pathology, assistant instructor, associate, and associate professor in physiology (1899-1906) at the university. He filled a professorship in physiology at the University of Wisconsin from 1906 to 1910, when he took up the same duties at Washington University.

ERLAU, ər'lou, or EGER. The capital and an episcopal city of the County of Heves, Hungary, about 80 miles northeast of Budapest (Map: Hungary, G 3). The streets are narrow and ill kept, but some of its public buildings are very beautiful. Among these are the large cathedral (1831-37) in the Italian style; the archbishop's palace, with a valuable library; a lyceum built by Count Eszterházy in 1765-85, with a lofty observatory, a library, a town hall, and theatre. There is also a beautiful minaret, the remains of a mosque. It has seven monasteries, the chief being that of the Cistercians. It has two Catholic theological institutions, a library of 50,000 volumes, an English girls' school, a gymnasium, and a teachers' seminary. The industries and commerce of Erlau are important. Production of the red Erlauer wine, which is famous as the best in Hungary, is the main industry. Near Erlau, on a spur of the Almagy Mountains, are the ruins of a castle. In the grounds is the tomb of Dobó, who defended the town against the Turks in 1552. A bishopric was founded here in the eleventh century by St. Stephen. In 1241 the place was destroyed by the Tatars, but was soon rebuilt. It was held by the Turks from 1596 to 1687. Pop., 1900, 25,893; 1910, 28,052.

ERLKÖNIG, ər'lkē-nik (Ger., from Dan. *ellerkonge, elver-konge, elf-king*). The name given in popular German mythology to a mischievous spirit that deludes men and children by weird rather than playful seduction. The word is properly *Elfenkönig*; its present form is due to Herder's confusing of *Elver-* or *Eller*, the plural of the Danish word *elv*, with *elle*, meaning in German *Erle*, the alder tree. The myth came from Scandinavia through Herder's (q.v.) *Voices of the Peoples*, which gives a translation of the Danish *Erliking's Daughter*. It passed into universal literature through Goethe's ballad *Der Erlkönig*.

ERLON, JEAN BAPTISTE DROUET. COUNT D'. See DROUET.

ERMAN, ər'mán, (JOHANN PETER) ADOLF (1854-). A German Egyptologist, born in Berlin, Oct. 31, 1854. His father, Georg Adolf Erman, and his grandfather, Paul Erman, were both professors of physics in the University of Berlin. Adolf Erman was educated at Leipzig and Berlin, and in 1883 was appointed associate professor of Egyptology in the latter university. In 1885 he became director of the Egyptian de-

partment of the Royal Museum at Berlin and in 1892 was advanced to the full professorship. Erman's most valuable services to Egyptology lie in the department of Egyptian grammar, and it is due to his labors that this study has been placed upon a truly scientific basis. Among his works which have had a most important influence upon the development of modern Egyptology are: *Die Pluralbildung des Aegyptischen* (1878); *Neuägyptische Grammatik* (1880); *Die Sprache des Papyrus Westcar* (1889); *Die Märchen des Papyrus Westcar* (1890); *Altägyptische Grammatik* (1894; Eng. trans. by Breasted, London, 1894); *Gespruch eines Lebensmüden mit seiner Seele* (1896); *Die Flection des ägyptischen Verbuns* (1900); *Zaubersprüche für Mutter und Kind* (1901); *Aegyptische Religion* (1909); *Aegyptische Grammatik* (1911). Erman's *Aegypten und aegyptisches Leben in Altertum* (1885), translated into English by Tirard under the title *Life in Ancient Egypt* (London and New York, 1894), is the best popular work upon the subject in existence.

ERMAN, GEORG ADOLF (1806-77). A German physicist, the son of Paul Erman. He was for a number of years professor of physical science in the University of Berlin. In 1828-30 he toured the world for the purpose of making magnetic determinations at different points of the globe. Upon the facts thus ascertained by Erman as a foundation, Gauss built his theory of terrestrial magnetism. Erman published *Reise um die Erde durch Nordasien und die beiden Oeeane* (1833-48) and other important works.

ERMAN, PAUL (1764-1851). A German physicist, born in Berlin. When the University of Berlin was founded (1810), he was chosen professor of physics and held the office until his death. He made important discoveries in electricity, magnetism, optics, and physiology, and wrote valuable works on these subjects. From 1810 to 1814 he was secretary of the class of physics and mathematics in the Academy of Berlin.

ERMELAND. See **ERMLAND**.

ERMENONVILLE, är'm'-nôn'vêl'. A village in the Department of Oise, France, 34 miles northeast of Paris. Pop. (commune), 1901, 498; 1911, 520. It is the site of the château and beautiful grounds of the Girardin estate, the property of Prince Radziwiłł, and celebrated as the residence and burial place of Rousseau in 1778. The remains of the philosopher were transferred to the Pantheon in 1794, whence they were secretly removed after the Restoration, and are said now to rest in their original tomb on an island in the park. Ermenonville was also the residence of Gabrielle d'Estrées, mistress of Henry IV.

ERMENT. See **HERMONTIS**.

ERMINE, ər'min (OF. *ermine*, *hermine*, MHG., Ger. *Hermelin*, dim. of OHG. *harmo*, AS. *hæarno*, weasel, Lith. *szermu*, weasel; explained by popular etymology as *mus Armcnius*, Armenian mouse). The name, in Europe, of the greater weasel, or stoat, in its white winter dress, when the fur is most highly prized. The term has no popular use in America as a name for the animal, but is applied wholly to the fur. The pelts come to market from British America, Lapland, northern Russia, and Siberia, and are used not only for ladies' winter garments, but for the robes of kings and nobles, and for their crowns and coronets. Ermine has thus obtained a distinct recognition in heraldry,

where the arrangement of black points represents the ornamental disposition of the black-tipped tails, which, in making up ermine fur, are inserted in a regular manner, so that their rich black shall contrast with the pure white of the rest of the fur. This came to be a matter for royal regulation in England from the time of Edward III, various ranks of officers being designated by the way the ermine tails were arranged. See **WEASEL**, and **Plate of FUR-BEARING ANIMALS**.

ERMINE and ERMINOIS. Terms for furs used in heraldry (q.v.).

ERMINE MOTH (so called from its markings). An English collector's name for sundry white moths marked with black spots, mostly tineids.

ERMINE STREET. One of the four great Roman roads of England, leading north from London to Lincoln, where it was met by the Fosse, and York, with an extension to Scotland. The lower portion of the road, through Epping and Hainault forests, did not exist until after Roman times.

ERMLAND, ər'm'lant, or **ERMELAND**, ər'me-lant. A diocese in East Prussia, now in the District of Königsberg. After Prussia had been occupied for Christianity by the Teutonic Order (after 1230), the papal legates divided it into four bishoprics, of which Ermland was one. When Riga was confirmed by Alexander IV in 1255 as the metropolitan see of those regions, Ermland was virtually self-governing by virtue of its political independence and was finally acknowledged to be exempt from its jurisdiction; nor could the later archbishops of Gnesen succeed in bringing it under their power. Even the pallium and the archbishop's cross were conceded to its prelates by Benedict XIV in 1742. The early bishops of Ermland were sovereigns in their own districts and, as such, princes of the Empire from 1354, under a certain feudal relation to the grand master of the Teutonic Knights, and from the Peace of Thorn (1466) to the King of Poland. When the latter, however, wished to nominate to the bishopric, as in the rest of his dominions, the chapter vindicated its rights under the earlier concordat of a free election. The most distinguished bishops were Æneas Sylvius Piccolomini, afterward Pope Pius II (1457-58), and Stanislaus Hosias (1551-79), who held his subjects to their allegiance to the Catholic church when the Reformation spread through all the surrounding territory. From 1525 to 1772 the diocese shared the political fortunes of Poland and in the partition of the latter year was assigned to Prussia. The bishopric of Ermland still remains in Prussia, with its seat at Braunsberg. Consult *Zeitschrift für Geschichte und Alterthumskunde Ermlands* (7 vols., Braunsberg, 1858 et seq.), and Hipler, *Analecta warmiensia* (ib., 1872).

ERN, or **ERNE** (AS. *earn*, ONorthum., OHG. *arn*, eagle; connected with Gk. *ἄρνις*, *ornis*, bird). The sea eagle. The word is rarely heard now except in poetry, though occasionally used in ornithology as a designation of a group differing from true eagles in having naked tarsi and in other minor features. See **EAGLE**.

ERNANI, ər-nā'nē. An opera by Verdi (q.v.), first produced in Venice, March 9, 1844; in the United States, November, 1847 (New York).

ERNE, ər'n. A river and lake in the southwest of Ulster Province, Ireland (Map: Ire-

land, D 2). The river rises in Lough Gowna, runs north, merging in Lough Oughter, in Cavan County, and after a reach of 10 miles in Upper Lough Erne in Fermanagh County then passes Enniskillen on another reach, whence it is navigable for vessels of 12 feet draft to its outlet, and after flowing through Lower Lough Erne finally empties into Donegal Bay near Ballyshannon. It has a total course of 60 miles. Lough Erne, one of the finest in the kingdom, is the most attractive feature of Fermanagh County, which it bisects. It extends 40 miles from southeast to northwest and consists of two lakes, the upper and lower, joined by a narrower part 10 miles long, with Enniskillen midway between the two lakes. The upper lough is 12 by 4 miles in extent, 10 to 75 feet deep, 151 feet above sea level, and has 90 green hilly islets. The lower lough is 20 by 7½ miles in extent, 100 to 266 feet deep, 148 feet above the sea, and has 109 similar islets. Salmon, trout, pike, bream, and eels abound. The scenery is singularly varied and beautiful, with the added attractions of interesting archaeological features. Devenish, one of the largest of the islands, contains the ruins of an abbey and a round tower, one of the most perfect specimens in Ireland. Consult Devenish, *Lough Erne: Its Histories, Antiquities, and Traditions* (Dublin, 1897).

ERNESTI, ěr-nĕs'tĕ, JOHANN AUGUST (1707-81). A German classical scholar. He was born at Tennstädt in Thuringia and studied at Schulpforta, Wittenberg, and Leipzig. After having been appointed rector of the Thomas school in Leipzig in 1734, he turned his attention chiefly to classical literature. In 1742 he became professor extraordinarius in the University of Leipzig, in 1756 professor of rhetoric, and in 1759 professor of theology. Ernesti's wide training in philology enabled him to inaugurate a new era in biblical interpretation, and he established a school of New Testament exegesis, based on sounder principles of grammatical and historical interpretation than had prevailed, through his work *Institutio Interpretis Novi Testamenti* (1761; 5th ed. by C. F. Ammon, 1809), translated by Moses Stuart under the title *Elements of Interpretation* (Andover, 1822; 4th ed., 1842). Other theological works are his *Anti-Muratorius* (1755) and *Opuscula Theologica* (1792). As classical philologist, he edited Xenophon's *Memorabilia*, Aristophanes' *Clouds*, Homer, Callimachus, Polybius, Tacitus, and Suetonius, but his greatest classical work was his edition of *Cicero* (6 vols., Leipzig, 1737-39); this contained the *Clavis Ciceroniana*, an excellent dictionary of Cicero's phraseology, with a conspectus of the Roman laws mentioned by Cicero. Consult: Ernesti, *Memoria J. A. Ernesti* (1781); Van Voorst, *Oratio de J. A. Ernesti* (1804); *Allgemeine deutsche Biographie*, vol. vi (Leipzig, 1878); Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

ERNST, ěrnst (1441-86). Elector of Saxony from 1464 to 1486. He was the eldest son of the Elector Frederick the Mild. At the age of 14 he and his brother Albert were kidnapped (the famous *Prinzenraub*) by a revengeful knight, but were speedily recovered. In 1464 he succeeded his father as Elector, but ruled jointly with his brother Albert till 1485. In that year they divided their paternal possessions, each assuming full sovereignty over his part. Ernst ruled his territory well and increased it by pur-

chase and conquest. The electoral dynasty remained with the Ernestine or elder branch till 1547, when it was transferred to the younger or Albertine line. Ernst died at Colditz in 1486. Descended from Ernst are the present houses of Saxe-Weimar, Saxe-Altenburg, Saxe-Meiningen, and Saxe-Coburg-Gotha.

ERNST (1554-1612). Duke of Bavaria and Elector of Cologne, a son of Albert V of Bavaria. Educated by the Jesuits, his entire life was devoted to extending the counter-reformation in the five bishoprics, in each of which he became Bishop—Freising (1566), Hildesheim (1573), Cologne (1583, after his defeat of Gebhard), Liège (1581), and Münster (1584). He took an active part in the religious and political contests of the period and vigorously opposed the Protestant Leagues.

ERNST I, called the Pious (1601-75). Duke of Saxe-Gotha and Altenburg and founder of the house of Gotha. He was the son of John Duke of Weimar, a member of the Ernestine line. He fought in the Thirty Years' War under Gustavus Adolphus and his own younger brother, the famous Bernhard of Weimar, and distinguished himself in the battles of Nuremberg, Lützen, and Nördlingen. He signed the Peace of Prague in 1635 and thenceforth devoted himself to the administration of his possessions. By his wise and frugal management he raised his country from the economic and moral degradation into which it had sunk during the long war. He fostered industry and commerce, founded many schools and academies, and furthered the spread of religious instruction. He was one of the most enlightened princes of Germany, and his fame spread to Egypt and Abyssinia. Of his sons, Frederick, the eldest, continued the line of Gotha, while Bernhard founded the house of Meiningen, Ernst that of Hildburghausen, and Johann Ernst that of Saalfeld. The line of Frederick of Gotha became extinct in 1825 with the death of Frederick IV; in 1826 the heirs of Ernst of Hildburghausen received Saxe-Altenburg, and those of Johann Ernst of Saalfeld, Saxe-Coburg and Gotha. Consult Philipp, *Ernestus the Pious* (London, 1740), and Beck, *Ernst der Fromme* (Weimar, 1865).

ERNST II (1745-1804). Duke of Saxe-Gotha and Altenburg. He was the second son of Duke Frederick III and of Luise Dorothea of Meiningen. Upon the death of his father (1772) he at once entered upon a thorough reform of the government. Of a noble and charitable disposition, he gave large sums to charity. He refused the considerable sums offered by his kinsman King George III of England for levies to be employed against the American Colonies. He was a liberal patron of all the sciences and was the first to institute a measurement of an arc of the meridian in Germany. He established the astronomical observatory near Gotha and wrote anonymously astronomical works, including *Astronomische Tafeln* (1799). Consult the biography by Beck (Gotha, 1854).

ERNST I (1784-1844). Duke of Saxe-Coburg and Gotha. He succeeded his father in 1806. He fought against Napoleon in the War of 1806 and lost his dominions in consequence, but recovered them by the Peace of Tilsit (1807). He was forced to join the Confederation of the Rhine, but after the battle of Leipzig ranged himself on the side of the Allies, and was rewarded at the Congress of Vienna with the Principality of Lichtenberg, which he sold to

Prussia for 2,000,000 thalers in 1834. In 1826 Gotha came into his hands through failure of the reigning line. He left two sons—his successor Ernst II (q.v.) and Albert, Prince Consort of England. Consult Beck, *Geschichte des gothaischen Landes* (Gotha, 1868).

ERNST II, AUGUSTUS CHARLES JOHN LEOPOLD ALEXANDER EDWARD (1818-93). Duke of Saxe-Coburg-Gotha, son of Ernst I, and brother of Albert, Prince Consort of England. He was born at Coburg. After studying at Bonn and traveling extensively in Europe he entered the Saxon army. In 1844 he succeeded his father as Duke. Ernst enjoyed immense popularity owing to his habit of mingling with the people in their pleasures, and this, together with timely concessions, saved his territory from revolution in 1848 and 1849. In the war against Denmark he won, as commander of a German corps, the battle of Eckernförde. He favored a united Germany, but looked to Austria as the leader in the movement and bitterly opposed Bismarck. During the years of reaction (1849-52) he was almost the only German prince to remain liberal. In the war between Austria and Prussia in 1866 he, however, sided with the latter, and he took part in the Franco-Prussian War. At his death, without heirs, in 1893, the duchy passed to Prince Alfred, son of Queen Victoria. Ernst was an excellent musician, and some of his operas, among them *Santa Chiara* (1854), *Osilda* (1855), and *Diana von Solanges* (1858), were notably successful in Germany. Under the title of *Aus meinem Leben und aus meiner Zeit* (1887-89) he published memoirs of intense interest; Eng. trans., *Memoirs of Ernst II, Duke of Saxe-Coburg-Gotha* (London, 1888-90). Consult: Ohorn, *Herzog Ernst II* (Leipzig, 1894); Templey, *G. Freytag und Herzog Ernst von Coburg im Briefwechsel 1853 bis 1893* (ib., 1904); Beck, *Ernst II als Pfleger und Beschützer der Wissenschaft und Kunst* (Gotha, 1854).

ERNST, ADOLF. See STERN, ADOLF.

ERNST, HAROLD CLARENCE (1856-1922). An American bacteriologist, born at Cincinnati, Ohio. He graduated from Harvard in 1876 and from the Harvard Medical School four years later. There he served as demonstrator, instructor, and assistant professor between 1885 and 1895, and in 1895 he became professor of bacteriology. He was president of the Boston Society of Medical Sciences from 1898 to 1908 and of the Association of American Pathologists and Bacteriologists in 1908-09. Besides editing the *Journal of Medical Research* after 1896 and contributing scientific and medical articles to other periodicals, he is author of *Infectiousness of Milk* (1896); *Infection and Immunity* (1898); *Animal Experimentation* (1902); *Modern Theories of Bacterial Immunity* (1902).

ERNST, HEINRICH WILHELM (1814-65). An eminent Austrian violinist, born in Brünn, Moravia. In the Vienna Conservatory he studied under Böhm, Seyfried, and Mayseder. He aroused great enthusiasm at his first appearance in 1830 and from 1832 until 1850 spent most of his time in concert tours in Europe and England. His performances were characterized by brilliancy, vigor, and beauty of tone. Ernst's compositions have generally a bravura character and include works for the violin and orchestra, quartets, etc. His *Élégie* is still a favorite work with violinists. Consult A. Heller, *Heinrich Wilhelm Ernst im Urteile seiner Zeitgenossen* (Brünn, 1904).

ERNST, OSWALD HERBERT (1842-). An American soldier. He was born near Cincinnati, Ohio, studied for two years at Harvard, and then entered West Point, where he graduated in 1864. He served as assistant engineer of the Army of the Tennessee during the Atlanta campaign; was astronomer on the United States commission to observe the solar eclipse of December, 1870, in Spain; was instructor in military engineering, signaling, and telegraphing at West Point from 1871 to 1878, and had charge (1878-80) of the improvements of Western rivers and (1886-89) of harbor improvements in Texas. He was superintendent of public buildings and grounds in Washington, D. C., from 1889 to 1893, was superintendent of the United States Military Academy from 1893 to 1898, became lieutenant colonel of engineers in 1895 and brigadier general of volunteers in 1898, and during the Spanish War went to Porto Rico and commanded the troops in the affair of Coamo (Aug. 9, 1898), receiving the brevet of colonel. He was inspector general of Cuba in 1899, a member of the original Isthmian Canal Commission in 1899, 1901, and 1905, and a director of the Panama Railroad. He retired in 1906, but remained a member of the International Commission on waters adjacent to boundary lines between Canada and the United States. He wrote a *Manual of Practical Military Engineering* (1873) and a *Report* (1904) on the tunnels under the Chicago River.

ERNST AUGUST (1771-1851). King of Hanover. He was born at Kew, the fifth son of George III. He pursued his studies at Göttingen from 1786 to 1791 and, entering the Hanoverian army, fought against France (1793-95). In 1799 he was created Duke of Cumberland in England and became a leader of the High Tories. In 1807 he became grand master of the Orange lodges. On the death of William IV, in 1837, Ernst August as the next male heir succeeded to the throne of Hanover. His reactionary principles made him hated in England, but he was very popular among his Hanoverian subjects. Consult Wilkinson, *Reminiscences of King Ernst of Hanover* (London, 1886), and Morse Stephens, in the *Dictionary of National Biography*.

ERNST KASIMIR, kü'sä-mër (1573-1632). Count of Nassau-Dietz, a nephew of William of Orange, born in Dillenburg. He entered the Dutch army in 1594 and after fighting in nearly all the campaigns of Maurice of Orange (whom he succeeded as stadholder of Gröningen and Drenthe in 1625) was made a field marshal. In 1620 he became Governor-General of Frisland and in 1625 of Gröningen and Drenthe. In 1621 he fought anew against the Spaniards, conquered Bergen op Zoom and Steenberg (1622), and fell at Roermonde, June 5, 1632.

ERNST LUDWIG, löf'vik (1868-). Grand Duke of Hesse, born at Darmstadt, a son of the Grand Duke Ludwig IV (1837-92), whom he succeeded in 1892. In 1896 he was made lieutenant general. In 1894 he married Princess Victoria Melita of Saxe-Coburg-Gotha. He divorced her in 1901—she married Prince Cyril of Russia in 1905—and in 1905 the Duke married Princess Eleonore of Solms-Hohensolms-Lich, who bore him two sons, George in 1906 and Ludwig in 1908. In 1909 the Duke's play *Bonifatius* was produced at Darmstadt in the Court Theatre.

EROS. See CUPID.

EROS (Lat., from Gk. *Ἔρως*, Cupid). A

planetoid (q.v.) discovered by Witt, of Berlin, in 1898. It is remarkable on account of the fact that it approaches the earth much nearer than any other known body in the heavens except our own moon and possibly certain comets, its distance at opposition being less than 15,000,000 miles. On account of its proximity to the earth, Eros is favorably situated for the determination of the solar parallax (q.v.). During the opposition of 1900 an international campaign of observation was undertaken for the purpose of determining this important constant. Nearly 300 photographs of Eros were secured, which were reduced by Hinks, and the value 8.7966" was obtained. Eros has been found to vary in brightness. In explanation it has been suggested that the planetoid is really double, consisting of two bodies revolving almost in contact with a period of between five and six hours.

EROSION (Lat. *erosio*, from *erodere*, to gnaw, from *e*, out + *rodere*, to gnaw), or **DENUDATION**. The process by which the surface forms of the earth are sculptured and worn down. The present features of the earth's surface, while they have the appearance of great stability, in reality represent a single stage of development that has been determined by the coöperation of various geological agencies working through long periods of time. Some of these agencies contribute to the erosion or denudation of the land, carving out valleys in plateaus, wearing down mountains, dissecting plains, and generally lowering the level to that of the sea. Rivers are most active in this process. The surface waters supplied by rain and by melting of snow wash the soil and disintegrated rock materials down the slopes of the land into the valleys, where the detritus is carried along by the streams and deposited in their channels or borne to the sea. The solid particles suspended in water exert an abrasive action on the sides and floor of river channels, thus tending to widen and deepen them. A large amount of material is also held in solution and transported in this manner to the sea. The rate at which rivers carry on the destructive work varies in particular regions with the climate, slope of land, and character of rocks. Rainfall, sunshine, and frost, and the chemical action of the atmosphere by means of its carbonic-acid gas, ammonia, and nitrous gases, greatly facilitate the breaking down of rocks, which is a preliminary step to their erosion and transport. The burden carried by the streams of the United States has been estimated by Dole and Stabler to be equivalent to 350,000,000 cubic yards of rock a year, sufficient to lower the whole area one inch in 760 years. The Po is said to remove one foot of rock from its basin in 730 years. This wasting or destruction work of rivers, when continued through long periods of time, must produce great changes. Glaciers, like rivers, are denuding and transporting agents. The weight of the thick masses of ice gives them great erosive power, which is further increased by the rocks carried along the bottom of their beds. At present the occurrence of glaciers in the warmer zones is limited to regions of high elevation, but in past ages it is known that they occupied great continental areas. The Rocky Mountains, the Sierra Nevadas, a large part of the northern United States, and nearly the whole of Canada were once the seat of ice sheets which have profoundly modified the surface features. Another important denuding force is the sea, particu-

larly in the upper portion, where the water is kept in motion by waves, tides, and currents. Wave action breaks down cliffs and gives to the coast lines of continents a constantly changing form. Tides carry seaward the sediment brought down by rivers to their mouths.

The immediate effect of erosion is to produce a variety of contour on land surfaces. The forms or types of scenery exhibited in any one locality depend upon the combination of factors at work and the material exposed to their action. A level land area composed of rocks unequally resistant to abrasion must in time be carved into a series of hills and valleys, the position of which will depend upon the relative disposition of the harder and softer materials. In the process of land sculpturing it is also necessary to consider the predominant erosive agencies, which will vary in different regions and in different climates. Arid districts, like the Bad Lands of South Dakota and the plateaus of Arizona, have peculiar types of scenery that cannot be found in countries having a heavier rainfall. The general tendency of erosion is to reduce the level of continents to that of the sea (base level). This destructive process is offset in a measure by movements of the earth's crust which repair what has been lost by superficial waste. The amount of material removed from the land is represented by an equivalent accumulation beneath the sea, and by upheaval this accumulation may be raised above water level. The activity of the two processes, antagonistic in their effect, is illustrated by the areas of stratified rocks, such as sandstones, shales, limestones, which form by far the larger portion of the surface of continents. Consult: Geikie, *Text-Book of Geology* (London, 1903); Davis, *Physical Geography* (Boston, 1900); Gilbert, "Geology of the Henry Mountains," *United States Geological Survey Reports* (Washington, 1877); Chamberlin and Salisbury, *Geology*, vol. i (New York, 1909). See **PHYSIOGRAPHY**; **GEOLOGY**; **MOUNTAIN**; **SHORE**; **CONTINENT**; **ETC.**

EROSTRATUS. See **HEROSTRATUS**.

EROTOMANIA (Neo-Lat., from Gk. *ἐρωτομανία*, love-mania, from *ἔρως*, *erōs*, love + *μανία*, *mania*, madness). An unfortunate term applied to a class of patients suffering from paranoia (q.v.), in whom the morbid ideation centres around some real or imaginary object of platonic love. These patients are generally hypochondriacal and religious as well as erotic and have various expansive ideas.

ERPENIUS (1584-1624). The Latin form of the name of Thomas van Erpe, one of the earliest and most eminent of European Orientalists. He was born at Gorkum, in Holland, Sept. 11, 1584. At an early age he was sent to Leyden, where he directed his attention to theology and to the study of Oriental languages. Having completed his course, he traveled through England, France, Italy, and Germany, and returned to Holland in 1612. In 1613 he became professor of Oriental languages at Leyden. The professorship of Hebrew not being vacant at this time, a second Hebrew chair was founded expressly for him in 1619. Soon after this he was appointed Oriental interpreter to the government. Towards the close of his life tempting offers of honors and distinction came pouring in upon him from all parts of Europe; but he was never prevailed upon to leave his native country, where he died Nov. 13, 1624. His works are: *Grammatica Arabica Quinque Libris Methodice Ex-*

EROSION
"THE DUTCH WEDDING" IN MONUMENT PARK

plicata (1613); *Rudimenta Linguae Arabicae* (1620); *Historia Saracenica Auctore Georgio Elmacino* (1625); *Proverbiorum Arabicorum Centuria Duæ* (1614); *Locumani Sapientis Fabulae* (1615).

ERRANTIA (Lat., wandering, from *errare*, to wander). A group of polychaetous annelids, characterized by their active manner of life. See ANNULATA.

ERRARD, ă'ră'r', CHARLES (1606-89). A French painter and architect, born at Nantes. He studied under his father, Charles Errard the Elder (1570-c.1635), an historical and portrait painter, and in Rome, where many of the early years of his life were spent. Upon his return to France (1643) he was employed by Louis XIV to decorate the Louvre, Tuileries, and other palaces. The paintings of Errard have all been destroyed, excepting an allegorical painting in the Museum of Reims. The best-known example of his architecture is the church of the Assumption in Paris (1676). He also illustrated the *Parallèle de l'architecture ancienne et moderne* (1666), written in collaboration with M. de Chambray, and designed numerous antique ornaments and vases. But, as painter, architect, and draftsman, his style was heavy and lacking in character, his chief claim to remembrance being that he was one of the 12 original members of the Académie de Peinture et de Sculpture, in 1648, and was prominently instrumental in the establishment of the French Academy at Rome, of which he was the first director (1666).

ERRATICS. See BOULDER, ERRATIC.

ERRERA, ăr-ră'ra, ALBERTO (1842-). An Italian political economist, born in Venice and educated at Padua. He held professorships of political economy and statistics at the technical schools of Venice, Milan, and Naples, and at the University of Naples. Among his published works, several of which are of permanent value, are: *Storia e statistica delle industrie venete* (1870); *Storia dell'economia politica nei secoli XVII e XVIII negli stati della repubblica Veneta* (1877); *Demografia* (1892); *Lezioni di economia politica* (1892).

ERRITT, ISAAC (1820-88). A clergyman of the Disciples of Christ, born in New York City. He began to preach in 1840 and for many years was secretary or president of several of the missionary societies of his church. From 1866 he was editor of the *Christian Standard* (Cincinnati). He died in Cincinnati, Dec. 19, 1888. His books include: *Walks about Jerusalem* (1872); *Talks to Bereans* (1875); *Evenings with the Bible* (1884-87). For his life, consult Lamar (Cincinnati, 1894).

ERRHINES, ăr'rînz (Gk. ἑρρινων, *errhinon*, errhine, from ἑρ, *en*, in + ῥις, *rhis*, nose), or **ERRHINATORIES**. Medicines formerly administered locally to produce sneezing and discharge from the nostrils, in catarrh. Common snuff and other vegetable irritants are so used.

ERROR (Lat. *error*, from *errare*, to wander). In observations of every kind errors are unavoidable. As in astronomy and other exact sciences correctness in the result of instrumental measurements is of the first consequence, it is the constant care of the observer to detect and make allowances for errors. The three principal sources from which errors may arise are: 1. External or incidental causes, such as fluctuations of weather, which disturb the amount of refraction; changes of temperature, affecting the

form and position of instruments, etc. 2. Errors of observation, being such as arise from inexactness, defective vision, slowness in seizing the exact instant of an occurrence, atmospheric indistinctness, etc.; and such errors as arise from slips in clamping and momentary derangements of the instrument. 3. Instrumental defects, owing to errors in workmanship, and such as arise from the instrument not being properly placed ("errors of adjustment"). The first two classes of errors, so far as they cannot be reduced to known laws, alter the results of observations to their full extent; but being accidental, they necessarily sometimes diminish and sometimes increase them. Hence, by taking numerous observations under various circumstances, and by taking the mean, or average, of the results obtained, these errors may be made to counterbalance one another partially, and to that extent they may be rendered harmless. With regard to the third class, it is the peculiarity of astronomical and physical observations to be the ultimate means of detection of all defects of workmanship and adjustment of instruments, which by their minuteness elude every other mode of detection, and such errors, when found out, can almost invariably be removed. It may be mentioned, however, that the method of subduing errors of the first two classes by the law of average is not applicable in all cases. In certain cases recourse must be had to a system of reduction or calculation, known as the method of least squares. See LEAST SQUARES, METHOD OF.

ERROR, WRIT OF. A common-law process for redressing erroneous judgments, which has been superseded to a great extent in England, as well as in most of the United States, by the process of appeal. A court possessing the power to grant this writ is sometimes called a court of error. In some of our States the court of last resort, whose judgments are not subject to revision by another tribunal, is known as the supreme court of errors. See COURT.

The procedure under a writ of error is somewhat similar to that in an original action, the defeated party therein becoming the "plaintiff in error," and the successful party the "defendant in error." The writ recites, in a general way, the cause of the defeated party's complaint, while the *assignments of error* specify the particular mistakes of law alleged to have been made by the lower court. These specifications are denied by the defendant in error, and thus an issue of law is raised for the court of error, the decision of which results either in an affirmance or reversal of the judgment of the lower court. Apart from the difference in the procedure employed, a writ of error differs from an appeal in that it brings up for review only alleged errors of law committed by the trial court, whereas an appeal takes up the whole case for reconsideration by the higher court and may therefore involve the reexamination of the questions of fact determined in the court below. In the United States the writ of error is the appropriate process for carrying a case from the highest appellate court of a State to the Supreme Court of the United States. See APPEAL; PROCEDURE; PLEADING.

ERSCH, ărsh, JOHANN SAMUEL (1766-1828). The founder of modern German bibliography, born at Grossglogau, Silesia. At Halle, whither he was sent to study theology in 1785, he devoted himself also to historical investigations.

After several years of editorial work in Jena, Göttingen, and Hamburg, during which time he held the chair of philosophy, then that of geography and statistics at Halle, he commenced, with Gruber, in 1818 the publication at Leipzig of the *Allgemeine Encyclopädie der Wissenschaften und Künste*, a work of immense value. His *Handbuch der deutschen Litteratur seit der Mitte des achtzehnten Jahrhunderts bis auf die neueste Zeit* (1812-14) is excellent for its time.

ERSE, ěrs, a name given to Irish Gaelic and also applied by the Lowlanders in Scotland to the people of the Highlands, as will be seen in the thirteenth-century laws of the Bretts and Scots (q.v.). Erse is an early Scottish variant of the word "Irish" (OE. *Irisc* or *ONorse Irskr*), for which the native name is Gaelic. Though the word is now nearly obsolete, it is still used by some writers as the ordinary designation of Irish alone.

ERSKINE, ěrs'kĭn, DAVID STEWART, eleventh EARL OF BUCHAN (1742-1829). A Scottish author and antiquarian. He was educated at the University of Glasgow, after having received instruction in mathematics from Colin MacLaurin. In 1780 he founded the Society of Scottish Antiquaries. His agitation effected a reform in the election of Scottish representative peers. He wrote: *An Account of the Life, Writings, and Inventions of Napier of Merchiston* (with Dr. Walter Minto, 1787); *Essays on the Lives of Fletcher of Saltoun and the Poet Thomson* (1792); *Anonymous and Fugitive Essays* (1812).

ERSKINE, EBENEZER (1680-1754). A Scottish theologian, the founder of the Secession church in Scotland. He was the son of the Rev. Henry Erskine, minister of Chirnside in Berwickshire, and was born at Dryburgh, Berwickshire, June 22, 1680. He studied at Edinburgh, and, after acting for some time as tutor and chaplain in the family of the Earl of Rothes, he was licensed to preach the gospel by the presbytery of Kirkcaldy in 1703. In the same year he was appointed minister of Portmoak in the shire of Kinross. In 1731 he was transferred to Stirling, after having discharged the pastoral office in Portmoak for 28 years. Previous to this event, however, the religious peculiarities of Erskine had brought him into unpleasant relations with some of his brethren, by his defense of the *Marrow of Modern Divinity*, a book regarded as not strictly Calvinistic. Later he protested against the assumption of authority by the synod in the matter of assigning ministers and, along with three other clergymen, was deposed in 1733. (See PRESBYTERIANISM.) He was shortly after joined by his brother Ralph and several other ministers. They now virtually formed a distinct sect, but they still continued to occupy their parish churches. The synod in 1734 restored them to their legal connection with the church, but Erskine would not accept its action. In 1736 Erskine and his friends formally seceded, but still it was not till 1740 that they were ejected from their churches. Shortly after this, a quarrel broke out among the seceders in regard to the propriety of taking the civic oath required of burgesses of Edinburgh, Glasgow, and Perth. The result was a division of the sect into two bodies, the Burghers and Antiburghers. Erskine was the leader of the Burghers. He died in Stirling, June 2, 1754. His *Works* were published in 1785 and his *Life and Diary* in 1840, at Edinburgh. Consult his life by J. Ker (London, 1881).

ERSKINE, JOHN (OF DUN) (1509-91). A Scottish reformer, of a noble family, which lost several members at Flodden Field. He was educated at King's College, Aberdeen, and then abroad, after accidentally killing a priest. He brought the study of Greek into Scotland and was one of the first followers of Knox, his signature being affixed to the first covenant of the Scottish reformers. He was one of the commissioners sent to France to attend the marriage of Queen Mary and acted as mediator between Knox and the Queen in their famous quarrel. In 1578 he helped compile *The Second Book of Discipline*.

ERSKINE, JOHN, eighteenth LORD ERSKINE and eleventh EARL OF MAR (1675-1732). A Scottish politician. He was born at Alloa and in 1705 became Secretary for Scotland. He was a commissioner for the Union and in 1713 English Secretary of State. He became one of the principal leaders of the Jacobite party, and in 1715 was commander in chief of the Pretender's forces in Scotland. He had to retreat after the battle of Sheriffmuir, on Nov. 13, 1715, and accompanied the Pretender to Saint-Germain, where he engaged in all sorts of intrigues, and severed his connection with the Stuarts in 1724. He was unscrupulous and corrupt, and utterly devoid of principle in politics; but he is said to have been a man of ability and to have suggested several important municipal improvements for Edinburgh.

ERSKINE, JOHN (of Carnock, and afterward of Cardross) (1695-1768). An eminent Scottish jurist and professor of Scots law in the University of Edinburgh. He was the son of the Hon. John Erskine, of Carnock. John Erskine, the father, was a man of importance in his day, not only on account of the family to which he belonged, which even then had been prolific in historical characters, but in consequence of his personal qualities and the positions which he held. Having been forced to quit Scotland from his attachment to the Presbyterian religion, he retired to Holland and became an officer in the service of the Prince of Orange. At the Revolution he accompanied William to England, and as a reward for his services was appointed Lieutenant Governor of Stirling Castle and lieutenant colonel of a regiment of foot. John Erskine, the younger, born 1695, became a member of the Faculty of Advocates in 1719, but did not succeed as a practitioner of the law. On the death of Alexander Bain, in 1737, Erskine was nominated to succeed him in the chair of Scots law, an office the duties of which he performed with great reputation for 28 years. In 1754 he published his well-known *Principles of the Law of Scotland*, which, like the Commentaries of Blackstone in England and America, became the favorite textbook for many successive generations of law students. On his retirement from the professorship in 1765, Erskine occupied himself in preparing his more important work, *The Institutes of the Laws of Scotland*, but it was not published till 1773, five years after his death. As a legal writer, Erskine is inferior to none of the Scottish jurists, with the single exception of Lord Stair, who had the benefit of the more learned and wider judicial training of earlier lawyers who were educated in a continental school. But of all those departments which constitute the law of Scotland, as developed by the usages and forms of society in

the country itself, there is at the present day no clearer, sounder, or more trustworthy expositor than Erskine.

ERSKINE, JOHN (1721-1803). A Scottish theologian, son of John Erskine, of Carnock; he was born in Edinburgh, June 2, 1721, studied at the University of Edinburgh, and in 1743 was licensed to preach by the presbytery of Dunblane. In the following year he was ordained minister of Kirkintilloch, near Glasgow, where he remained until 1753, when he was presented to the parish of Culross in the presbytery of Dunfermline. In 1758 he was transferred to New Greyfriars Church, Edinburgh, and in 1767 he was promoted to the collegiate charge of Old Greyfriars, where he had for his colleague Dr. Robertson. In the General Assembly of the Church of Scotland he was for many years the leader of the popular or evangelical party. He died in Edinburgh, Jan. 19, 1803. Erskine's writings are exceedingly numerous. They consist mostly of sermons and theological pamphlets, and exhibit a superior degree of ability. For his life, consult Wellwood (Edinburgh, 1818).

ERSKINE, JOHN (1746-1817). A Scottish lawyer. He was born in England and was a brother of Thomas, Lord Erskine. He was a Whig in politics and was appointed Lord Advocate of Scotland in 1783 and again in 1806. His fame rests chiefly on his wit and eloquence as an advocate at the Scottish bar.

ERSKINE, JOHN (1879-). An American university professor of English, born in New York City. He graduated from Columbia University in 1900 (A.M., 1901; Ph.D., 1903), where he became associate professor of English in 1900. He had previously served as instructor in English (1903-06) and associate professor (1906-09) at Amherst College. Besides numerous magazine contributions in prose and verse, he published: *The Elizabethan Lyric* (1903); *Selections from The Faerie Queene* (1905); *Actaon and Other Poems* (1907); *Leading American Novelists* (1910); *Written English*, with Helen Erskine (1910; rev. ed., 1913); *Selections from the Idylls of the King* (1912); *The Kinds of Poetry* (1913); *Poems of Wordsworth, Shelley, and Keats*, with W. P. Trent (1914); and he contributed to the second edition of the *NEW INTERNATIONAL ENCYCLOPEDIA*.

ERSKINE, RALPH (1685-1752). A Scottish clergyman. He was born at Monilaws in Northumberland, studied at the University of Edinburgh, was licensed to preach in 1709, and became pastor at Dunfermline, in 1711, of the United Free Church in Queen Anne Street. He sympathized with the sentiments of his brother, Ebenezer Erskine (q.v.), who founded the Scottish Secession church, and in 1737 formally withdrew from the Church of Scotland. Like his brother, he was a most popular preacher. His *Gospel Sonnets* (1732; 25th ed., 1795) show Watts's influence and his poem *Smoking Spiritualized* is a quaint conceit. Consult his *Life and Diary* (Edinburgh, 1842) by Fraser.

ERSKINE, THOMAS, LORD (1750-1823). An eminent English advocate. He was born in Edinburgh, Jan. 21, 1750, the youngest son of Henry David, the tenth Earl of Buchan. His early education was meagre, though he attended classes at St. Andrews University during 1762 and 1763. At the age of 14 he entered the navy as midshipman and served for several years in

the West Indies. Returning to England soon after the death of his father, he gave up the navy for the army.

Although he had been promoted to a lieutenantancy, he was led by a chance conversation with Lord Mansfield to make a second change in his profession—to give up the army for the bar. He sold his commission in 1775, entered Lincoln's Inn, became a student in the chambers of Buller (afterward Mr. Justice Buller), matriculated as a gentleman commoner in Trinity College, Cambridge, and was called to the bar in 1778. During this period of study he was very poor; and he declares that he was spurred to the eloquence which gained for him instant fame, in his first case, by the thought that his children were plucking at his gown, crying to him that now was the time to get them bread. Not only did his remarkable address "entrance the judges and the audience," but it brought him many retainers and opened to him a lucrative practice. In 1779 he received from Admiral Keppel, whose acquittal upon court-martial he had secured, a £1000 fee. Five years later his annual income had increased to £3000, and it is said that he made while at the bar £150,000. He was not a great lawyer, but his unflinching courtesy, good humor, high spirits, and great eloquence placed him at the head of the English bar. His most remarkable successes as an advocate were gained in a series of litigations connected with the law of libel and treason. His defense of the dean of St. Asaph led to the passing of Fox's Libel Act in 1792, which affirmed the doctrine for which Erskine had contended, that the question whether a particular publication is libelous or not is for the jury and not for the court. By his successful defense of Walker, Hardy, Horne Tooke, and others, he exploded the theory of constructive treason upon which the prosecutions of these persons were based, and rendered invaluable service to the cause of personal liberty. In all these cases, as well as in his defense of Paine on the occasion of the publication of *The Rights of Man*, he displayed great moral courage and a lofty conception of professional duty.

Erskine entered Parliament in 1783, but his career both in the House of Commons and in the House of Lords was in striking contrast with that at the bar. His maiden speech was a failure owing to his fear of Pitt. On other occasions he actually broke down, and he was never able to address Parliament with the eloquence and power which characterized his forensic efforts. In 1806 he was made Lord Chancellor and elevated to a peerage with the title of Baron Erskine of Restormel. His reputation was not enhanced by his labors in this office, and after his retirement from the chancellorship, when the Whigs went out of office in 1807, he sank into comparative insignificance and poverty. Dying in 1823, he left his second wife and young child in straitened circumstances. Consult Campbell, *Lives of the Chancellors* (London, 1868), and High, *Speeches of Lord Erskine* (Chicago, 1876).

ERSKINE, THOMAS, of Linlathen (1788-1870). A Scottish writer on theology. He was born at Edinburgh, studied law at Edinburgh University, and practiced from 1810 until 1816, when he devoted himself to literary work. His theological views, particularly on "universal restoration" and the Atonement, were not or-

thodox; but his earnestness won them favor, and John McLeod Campbell (q.v.) and Fred-eric Denison Maurice (q.v.) were much indebted to them. The public advocacy of them led to Campbell's expulsion from the Kirk in 1831. Erskine's principal writings are: *Remarks on the Intinial Evidence of the Truth of Revealed Religion* (1820; 10th ed., 1878); *The Unconditional Freecness of the Gospel* (1828; new ed., 1873); *The Doctrine of Election* (1837; 2d ed., 1878); *Spiritual Order and Other Papers* (1871). His works were translated into French, and he had many friends in France. Consult his *Letters* (1877), ed. by William Hanna, with contributions by Principal J. C. Shairp and Dean Stanley.

ERULL. See HERULI.

ERUPTIVE ROCKS. See IGNEOUS ROCKS.

ERWIN VON STEINBACH, ər'ven fən stin'bäg. The name of two German architects, father and son, born in Steinbach, and successively occupied in the construction of a new façade for the cathedral of Strassburg between 1277 and 1339. Neither the dates of birth and death nor the precise work accomplished by either can be accurately stated; but the greater part of the façade was probably completed by 1339. The great northwest spire was not built till a century later. The name Erwin von Steinbach, by which both are generally known, was not used before the seventeenth century. In 1845 a memorial monument was erected at Steinbach.

ERXLEBEN, ərks'lä-ben, JOHANN CHRISTIAN (1744-77). A German physician and naturalist. He was born at Quedlinburg and was a son of the highly gifted Dorothea Christine Erxleben, the first woman who obtained the degree of M.D. in Germany. He was educated at Göttingen, where he occupied the chair of natural philosophy from 1771 until his death. His principal works are the textbooks *Anfangsgründe der Naturgeschichte* (4th ed., 1791) and *Anfangsgründe der Naturlehre* (8th ed., 1794).

ERYCINA (Lat., relating to Eryx, from *Eryx*, Gk. Ἐρυξ, a mountain in Sicily). A name of Aphrodite, derived from that of Mount Eryx.

ERYMAN'THUS (Lat., from Gk. Ἐρύμανθος, *Erymanthos*). The ancient name of a mountain chain in the extreme northwest corner of Arcadia, now called Olonos. The highest peak is 7300 feet. A small river, also called anciently Erymanthus (at present Douana), rises in the mountains and eventually joins the Alpheus on the borders of Elis. This region was the scene of the famous struggle of Hercules with the Erymanthian boar. Being ordered to bring the animal to Mycenæ alive, Hercules chased it into the deep snow and, having thus tired it out, caught it in a noose.

ERYNGO, ər-in'gō (Lat. *eryngion*, *erynge*, Gk. ἑρύγγιον, *eryngion*, ἑρύγγη, *eryngē*, *eryngo*), *Eryngium*. A genus of umbelliferous plants, which have simple umbels, resembling the heads of some composite flowers. The species number about 150 and are mostly natives of the warmer temperate parts of the world, with alternate simple or divided leaves, which have marginal spines. One species, the sea eryngo or sea holly (*Eryngium maritimum*), which is common in the British Isles and is frequent on sandy seashores, is a very stiff, rigid, and glaucous plant. *Eryngium campestre* has also been found in England and Ireland, but is very rare. Its root

was formerly much employed in some parts of Europe as a tonic. The root of *Eryngium maritimum* is used in the same way, possesses the same properties, and is sweet and aromatic. It is sold in a candied state and was formerly reputed to be a stimulant, restorative, and aphrodisiac. Eryngo root has also been used as an aperient and diuretic. Linnæus recommends the blanched shoots of *Eryngium maritimum* as a substitute for asparagus. *Eryngium fatidum*, a native of the warm parts of America, is called fitweed in the West Indies, a decoction of it being much used as a remedy in hysterical cases. *Eryngium yuccifolium*, a native of low, wet places in North and South America, is called rattlesnake master and button snakeroot. The root is said to be diaphoretic and expectorant and has a spurious reputation as a cure for the bite of a rattlesnake. A number of species are cultivated as ornamentals on account of their curious habit of growth and the steel-blue color of their stems and bracts.

ERYON (Neo-Lat., from Gk. ἐρύων, pres. part. of ἐρύειν, *eryein*, to draw out). A fossil macruran crustacean found in the Mesozoic rocks of Europe. The quadrate carapace is thin and flat, with deeply denticulate lateral margins, a straight or dented front margin, and a broadly truncated posterior margin. The thoracic legs are slender and bear pincers, the first pair being much longer than the others. The abdomen is shorter than the carapace, and the caudal swimming plates are small. About six species are known, ranging from the Liassic of England, through the Jurassic, into the Lower Cretaceous of Silesia. The best-known species is *Eryon propinquus*, with a body 5 inches long, of which finely preserved specimens have been found in the Jurassic lithographic limestones of Solenhofen, Bavaria. Eryon has a modern ally in the blind genus *Willemoesia*, which inhabits the deepest portions of the ocean. For illustration, see PLATE OF CRUSTACEA. FOSSIL.

ERYSICHTHON, ər'i-sik'thōn (Lat., from Gk. Ἐρυσίχθων, earth render). Son of the Thessalian King Triopas, punished by Demeter with unappeasable hunger because he cut down trees in a grove sacred to the goddess. He finally devoured his own limbs and died. His daughter Mnestra, who had received from Poseidon the gift of transforming herself into different shapes, was repeatedly sold by her father under the forms of a bird, a cow, and a horse, and each time returned to him.

ERYSIMUM (Lat., from Gk. ἐρύσιμον, *erysimon*, hedge mustard). A genus of plants of the family Cruciferae, with four-sided seed pods. *Erysimum cheiranthoides*, wormseed mustard, a branching annual, about 18 inches high, with small yellow flowers, is found in many parts of Europe and also in North America. It is not uncommon in waste places and cultivated grounds in the British Isles, but may perhaps have been originally introduced for its medicinal use. Its seeds were formerly much employed as an anthelmintic, from which it has the name of wormseed. It is also called treacle mustard, because it was employed as an ingredient in the famous Venice treacle. *Erysimum perfoliatum*, or *Conryngia orientalis*, hare's-ear mustard, is cultivated in Japan for the fixed oils contained in its seed. This plant has been introduced into parts of Canada and the United States, where it threatens to become a troublesome weed. Some of the plants formerly re-

ferred to as *Erysimum* are now included in other genera, as *Sisymbrium* and *Alliaria* (q.v.).

ERYSIPÉLAS (Lat., from Gk. *ερυσίπελας*, from *έρυσι-*, *erysi-*, variant of *έρυθρός*, *erythros*, red, Lat. *ruber*, *rufus*, Eng. *red*, Ger. *rot*, Ir. *ruad*, OChurch Slav. *rŭdrŭ*, Skt. *rudhira*, red + *πέλλα*, *pellē*, skin, Lat. *pellis*, Eng. *fell*, Ger. *Fell*, Lith. *plėvė*, skin), or **SAINT ANTHONY'S FIRE**. An inflammatory disease of the skin and subcutaneous tissues, attended by diffused redness and swelling of the part affected, and in the end either by desquamation or by vesication of the cuticle, or scarf skin, in the milder forms, and by suppuration of the deeper parts in the severer varieties of the disease (phlegmonous erysipelas). Erysipelas affects, in a large proportion of instances, the face and head; it is apt to be attended with a high fever and often with delirium and meningitis. Severe or phlegmonous erysipelas is apt to be succeeded by protracted and exhausting suppurations, and sometimes by diseases of the bones or inflammations of the internal organs. Erysipelas is frequently an epidemic disease in surgical hospitals, especially on the field of battle. (See **EPIDEMIC**.) It is dangerously infectious. The treatment is supportive—tonics, such as iron, strychnine, and quinine; antiseptic dressings, and occasionally incisions in deep erysipelas with tension or suppuration. Specific vaccines have proved valuable aids in the cure. The *Streptococcus erysipclatis*, identical with *Streptococcus pyogenes*, is the causative germ. The presence of the bacteria in the subcutaneous tissues causes redness of the overlying skin and more or less infiltration of the tissues with serum, or with serum and pus. See **ICHTHYOL**; **ANTHONY, SAINT, FIRE OF**.

ERYSIPHA'CEÆ. The family of mildews. See **MILDREW**.

ERYTHE'MA (Neo-Lat., from Gk. *έρύθημα*, redness, from *έρυθαίνειν*, *erythainōin*, to reddens, from *έρυθρός*, *erythros*, red). A term which has been loosely applied to many different diseases. In its correct usage it denotes not a disease, but a symptom, viz., a local congestion (or hyperemia) accompanied with superficial redness, which disappears under slight pressure. (Whitehouse.) Simple erythema consists of patches of rose, scarlet, or deep-purplish red, in spots, rings, or irregular patterns, or in areas with faint margins. There are heat and tingling, rarely tenderness. Heat, cold, friction, and pressure, bites and stings, irritant substances and chemicals, comprise the external causes; while rheumatism, drugs, toxin produced during fever or indigestion, and reflex nerve action are the principal internal causes. In inflammatory erythema there is an exudation, with elevation of the red surface and sometimes an extravasation of blood. (See **CHILBLAIN**; **FROSTBITE**.) There may be papules, vesicles, or irregular markings, nodules or blood blisters (*erythema exudativum multiforme*, Hebra). There may be fever, gastric symptoms, coated tongue, followed by pain and swelling about the joints, especially in the lower extremities, with the formation of nodes along the shins and tops (dorsa) of the feet; this constituting *erythema nodosum*. *Erythema venenatum* is a form due to exposure to poisonous plants. *Erythema solare* is another term for sunburn. Regulation of digestion, diuretics, alkaline solutions, oil inunctions, and protective powders or ichthyol are useful in the treatment in conjunction with

the removal of the immediate cause, where this can be determined.

ERYTH'IA. One of the Hesperides (q.v.).

ERYTHRÆ'A. See **CENTAURY**.

ERYTHRÆA. See **ERITRÆA**.

ERYTHRÆAN SEA (Lat. *Mare Erythraeum*, Gk. *ή έρυθρά θάλασσα*, the red sea). In ancient geography, a name applied to an expanse of the Indian Ocean, including the Arabian Sea and Persian Gulf. Later geographers restricted the name to the Arabian Sea.

ERYTHRITE. A hydrous arsenate of cobalt occurring in monoclinic prisms, in drusy, incrustating forms and in earthy pink crusts upon other cobalt minerals. It is usually crimson red to peach red in color, from whence it derives the common name of *cobalt bloom*. Erythrite occurs in Saxony, Baden, Norway, and in Pennsylvania, Nevada, and California. It has recently been found at Cobalt, Canada.

ERYTHRONIUM (Neo-Lat., from Gk. *έρυθρονιον*, *erythronion*, the name of some plant, from *έρυθρός*, *erythros*, red), **DOG'S-TOOTH VIOLET**, or **ADDER'S-TONGUE**. A genus of bulbous-rooted plants of the family Liliacæ, found in the light, rich soil of cool, moist, but not densely shaded woods of the north temperate zone. Nine species with numerous well-marked varieties are indigenous in British Columbia, Washington, and Oregon; one in the Rocky Mountains from Colorado to California; four in eastern North America, and four in the Old World. In early spring two radical leaves, often handsomely mottled, appear; between them is a naked scape bearing one or several flowers with more or less reflexed petals, whose colors range in some species through various shades of yellow to white, in others from greenish to lavender and reddish tints. *Erythronium grandiflorum* (for illustration, see **PLATE OF CALIFORNIA FLORA** and **PLATE OF MONOCOTYLEDONS**), one of the Pacific coast species, has unmottled leaves, produces 1-5 very bright yellow flowers on each scape. *Erythronium americanum*, of which there are several varieties, is the commonest species east of the Mississippi. (For illustration, see **PLATE OF LILIACÆ**.) The name "adder's-tongue" is also applied to the fern *Ophioglossum vulgatum*.

ERYTHROPHYLL (from Gk. *έρυθρός*, *erythros*, red + *φύλλον*, *phyllon*, leaf). A name formerly applied to the red pigments appearing in leaves in autumn. See **ANTHOCYAN**; **COLOR IN PLANTS**.

ERYTHROSIN. See **COAL-TAR COLORS**.

ERYTHROXYLON. See **COCA**.

ERYX (Lat., from Gk. *Έρυξ*). An ancient city and mountain in the western part of Sicily. The mountain is now known as Monte San Giuliano. The summit was occupied by a famous shrine of Venus Erycina. During the first Punic War it was held by Hamilcar Barca.

ERZBERG, erts'bérk. See **EISENERZ**.

ERZERUM, ər'z-rōm', or **ERZEROU**. The capital of the vilayet of the same name in Turkish Armenia, situated on a plain 6000 feet above the sea level (Map: Turkey in Asia, D 2). There are a number of mosques, baths, and mausoleums. Its fortifications have been renewed since 1864. Erzerum is famous for its copper and iron ware as well as for its shawls and carpets. The industries, however, have declined considerably on account of emigration and the turbulent state of the country. Its commerce, which was mostly with Persia, has

diminished since the completion of the Transcaucasian Railway, over which route the trade between Persia and Europe is mainly carried. The population is variously estimated at from 43,000 to 80,000, half of whom are Turks, the rest being Armenians, Persians, and Greeks. It is the seat of several consular representatives.

Erzerum is an ancient town. Its Armenian name was Garin Khalakh. Near it stood the old Syro-Armenian town of Arsen. When the Seljuks captured this place, the inhabitants fled to a fortress at Erzerum, which the Seljuks accordingly called Arsen-er-Rum, i.e., Arsen of the Romans (or Byzantines), whence the modern Erzerum. In 1201 it fell into the hands of the Seljuks; of the Mongols in 1242; and finally, in 1517, into those of the Turks. In the War of 1828-29, between the Turks and the Russians, the taking of Erzerum by the latter decided the campaign in Asia. Erzerum was an important military centre during the War of 1877-78 and held out against the Russians, who were allowed to occupy it at the close of the war. In October, 1878, it was returned to the Turks.

ERZGEBIRGE, *ërts'ge-bër'ge* (Ger., Ore Mountains). A mountain range of Europe, extending along the boundary line between Saxony and Bohemia (Map: Germany, E 3). It stretches southwest and northeast for a distance of about 100 miles, from the Elster Mountains on the southwest to the Elbsandstein Mountains on the northeast. It has a breadth of about 25 miles and rises abruptly on the south side, while the north side slopes gradually and contains many well-cultivated and fertile valleys. The highest peak, the Keilberg, is 4060 feet high, while the average elevation is about 2500 feet. The Elbe receives the drainage from both sides of the watershed—on the south through the Eger, and on the north chiefly through the Mulde. The range is crossed by numerous passes and railway lines. The forests are very extensive and the climate is somewhat rigorous. The summer air is, however, invigorating, and many resorts, such as Kipsdorf and Bärenfels, are found among the mountains. The main central mass is gneiss, with mica schist on the northern slope, but with some crops of eruptive rocks. The mineral deposits from which the range takes its name are of great importance. Silver was found in the Erzgebirge as early as the twelfth century, and lead, copper, tin, iron, nickel, and cobalt have been mined for a long time. Large deposits of coal are also found, and the industrial importance of Saxony and Bohemia is due to a large extent to the mineral wealth of the Erzgebirge.

ERZINGAN, *ër'zing-an*. The capital of a sanjak in the Vilayet of Erzerum, Asiatic Turkey, on the Sivas-Erzerum road, 86 miles southeast of Erzerum (Map: Turkey in Asia, D 2). It is 3900 feet above sea level, on the western fringe of a fertile plain watered by the western Euphrates. It is an important garrison town, and its chief features are the modern government buildings, extensive barracks, and military hospital. There are also a fine mosque, a good bazaar, an Armenian teachers' seminary, and Armenian schools for juveniles. With the exception of the main thoroughfare, the streets are narrow and dirty. There are manufactures of silk, cotton, canvas, and copper ware, and in the vicinity are government tanneries and clothing factories. Agriculture is

well developed, cereals and fruit being largely grown on the surrounding plains. The Arsingia of mediæval times, it was a place of importance as early as the fourth century. There are now, however, few traces of its antiquities. It was almost totally destroyed by an earthquake in 1784. Pop., about 18,000, of whom about one-half are Mohammedans and the rest Armenian Christians.

E'SARHAD/DON (Assyr. *Asur-ah-iddina*, Asur has given a brother). A King of Assyria who succeeded his father, Sennacherib, and reigned 681-668 B.C. He had been placed over Babylonia during his father's lifetime and by a special decree had been declared heir to the throne. In consequence perhaps of this favoritism shown to a son who was not the eldest, Sennacherib was murdered by two of his sons, Sharezer and Adarmalik (2 Kings xix. 36-37). The Babylonian chronicle, however, makes mention of only one son as the assassin. Proclaiming himself Governor of Babylonia, Esarhaddon set out in hot haste to avenge his father's death. The war, which is noted in the Babylonian chronicle as an interregnum, lasted less than a year, and at the end of that time Esarhaddon was able to declare himself King of Assyria. His reign was full of military campaigns. He conducted successful operations against the Chaldeans. In the west Sidon was captured and razed to the ground. Tyre he tried to take, but failed. His most important enterprise was an attack upon Egypt. In two campaigns (673 and 670 B.C.) Egypt was taken and reorganized under Assyrian rule. It was Esarhaddon's misfortune that during his time began the series of attacks from the north which finally ended in the fall of Assyria, but he did all he could to check them. In 668 Egypt rebelled, and he set out to chastise the rebels, but died on the way. He showed a great predilection for Babylon, and, granting the people as much independence as was consistent with the recognition of Assyrian supremacy, he planned the rebuilding of the city, which had been destroyed by Sennacherib in 689, and restored it to its former glory. By his wish Samas-sum-ukin was made Governor of Babylonia and Asurbanipal King of Assyria. Despite his numerous wars, he found time for elaborate building enterprises. He is regarded as one of the noblest of the Assyrian kings. See ASSYRIA.

ESAU (Heb. *Esau*, hairy). According to Gen. xxv. 24 ff., the elder son of Isaac and twin brother of Jacob. The rivalry of the two brothers began when they were still in the womb (Gen. xxv. 22). When Esau grew up, he became a "man of the field," as opposed to Jacob, who "dwelt in tents" (Gen. xxv. 27). As the elder son, he was entitled to precedence over Jacob, but sold his birthright to his brother (Gen. xxv. 29, 34). In spite of this he attempted to secure Isaac's dying blessing, which pertained to the birthright; but Jacob circumvented him, and Esau received only a secondary blessing (Gen. xxxvii. 1-40). Esau, now greatly enraged, resolved to kill his brother, and Jacob fled to escape him (Gen. xxxvii. 41, 45); but on Jacob's return from sojourning with Laban, 20 years after, Esau became reconciled to him (Gen. xxxiii. 1-15), and the two brothers later buried their father together (Gen. xxxv. 29).

This narrative is regarded by many scholars as reflecting the history of the Edomites, repre-

sented by Esau, and the Israelites, represented by Jacob. This is indeed suggested by the oracle: "Two nations are in thy womb, and two peoples shall part from thy bowels; and the one people shall be stronger than the other people, and the elder shall serve the younger" (Gen. xxv. 23). As a nation, Edom was older than Israel, having had a succession of kings before there was a union of the tribes and a kingdom in Israel (Gen. xxxvi. 31 ff.). But Edom was conquered by David and continued for some time to be subject to the dynasty he founded. The story reveals a certain admiration for the qualities of the kindred people, but also an unmistakable pride in the cleverness with which a richer blessing, i.e., greater prosperity and power, was won by Israel. There is no explicit or implied criticism of Jacob's cunning and deceit; it was the manifest destiny of Israel to become the ruler, and Edom would have to be satisfied with its lot. Israel had been foreordained to enjoy the luxuries of its rich land and to hold power over the older nation; let Edom hunt for a living among its mountains; but let both peoples be mindful of their common origin. In the judgment of many interpreters to-day, neither the poetic oracles nor the prose story can have been written before the reign of David, or after the reestablishment of Edomitish independence. Those who follow the current system of Pentateuchal analysis assume that in the narrative two versions—one Judæan, the other Ephraimitish—have been interwoven, and that the former shows more sympathy with Edom and a veiled criticism of the northern kingdom, Israel. But the analysis has been seriously questioned by independent scholars (see PENTATEUCH), and there seems to be no clear sign of any such criticism. There is nothing that necessitates a later date than the time of Solomon. See EDM, and consult Schmidt, *Messages of the Poets* (New York, 1911), and Gunkel, *Genesis* (3d ed., Göttingen, 1912).

ESBJERG, ɛs'byɛrg. A seaport of Denmark, situated on the North Sea, opposite the island of Fanø, and 35 miles west of Kolding (Map: Denmark, B 3). The town has considerable manufacturing and fishing and is an export centre for dairy products, bacon, beef, and cattle. It has steamship traffic with England and is the terminus of a submarine cable to Calais. Pop., 1890, 4111; 1901, 13,355; 1911, 18,208.

ESCALANTE, ɛs'kă-lăn'tă, JUAN (?-1519). A Spanish soldier and explorer. He went to Mexico with Hernan Cortés, by whom he was appointed high constable of Villa Rica de Vera Cruz, founded by Cortés at the place where he landed. At the order of his chief Escalante destroyed the Spanish fleet of 10 vessels and remained on guard at the new settlement with 150 men while Cortés marched to the interior. Because of the assassination of two of his men by hostile tribes Escalante with 50 of his men and several thousand Indian allies attacked the offending natives, but, though the Spaniards won the battle, he and seven of his men were killed.

ESCALATOR. A form of mechanical elevator for passengers or freight, in which the lift is in a direction inclined from the vertical. It resembles an endless band conveyor and is made up of slats or narrow platforms hinged to each other and carried by a pair of chains borne on revolving drums—one at the upper level and the other at the lower. The pas-

senger steps upon the moving band of slats or treads at the bottom, moving horizontally as upon a moving sidewalk (see TRAVELING SIDEWALK); but in a few feet thereafter the incline begins, and each slat or tread remaining horizontal forms a tread as of a stairway, moving upward along the incline. At the top the treads pass into horizontal motion, close together, and the passenger steps off upon the stationary surface at the end or side or both. Hand rails permit the passenger to steady his body as the treads ascend. The passenger can ascend the flight of treads as a stairway and thus hasten his transit. See ELEVATOR

ESCALLOP. See SCALLOP.

ESCALLOP, or **ESCALLOP** (OF. *escalope*, from MDutch *schelpe*, shell, dialectic Ger. *Schelfe*, husk, Eng. *scalp*), or **SHELL**. A symbol used in heraldry to signify that the bearer has made many long voyages by sea. As an emblem of pilgrimage, it was commonly given to those who had been to the Crusades, and it came to be regarded as indicating either that the bearer or his ancestor had been a crusader. The escallop shell was the emblem of St. James; hence all those who made the pilgrimage to his shrine at Compostela were entitled to bear the escallop shells. See HERALDRY.

ESCANABA, ɛs'kă-nă'bă. A city and the county seat of Delta Co., Mich., 73 miles south of Marquette, on the Chicago and Northwestern, the Minneapolis, St. Paul, and Sault Sainte Marie, and the Escanaba and Lake Superior railroads, and on Little Bay de Noquette, an inlet of Green Bay, Lake Michigan (Map: Michigan, C 3). Situated on a picturesque promontory and having excellent facilities for trout fishing and boating, Escanaba is a popular summer resort. It has a good harbor with a frontage of 8 miles, has regular steamboat connection with a number of lake ports, and is one of the most important shipping points for the Lake Superior iron region. There are eight iron-ore docks, handling more than 4,000,000 tons annually, and large merchandise docks, the trade in coal, fish, and lumber being extensive. The city contains railroad repair shops, an ore-crushing plant, furniture, flooring, and wooden-ware factories, and a tie-preserving plant. Noteworthy features include the public library, hospital, high school, city hall, county jail, and courthouse. Escanaba was settled in 1863, incorporated as a village in 1883, and first chartered as a city in the same year. Pop., 1900, 9549; *1910, 13,194; 1914 (U. S. est.), 14,747; 1920, 13,103.

ESCAPE (OF. *escaper*, *eschaper*, Fr. *échapper*, It. *scappare*, to escape; probably from ML. *ew capa*, out of a cloak or cape, from Lat. *ew*, out, and ML. *capa*, cape). In its broadest sense, the unauthorized liberation of a person from lawful custody, in any manner or for any time, however short. If the liberation is accomplished by the prisoner himself with force, it is called prison breaking, or *prison breach*; if it is effected by others with force, it is called *rescue*. An escape by the prisoner himself, if with force, is a felony, and, if without force, a misdemeanor, punishable by fine or imprisonment. Under modern statutes a prisoner who has made his escape and been recaptured loses the commutation of his sentence which he may have earned by previous good conduct. A person who aids a criminal in escaping, or in attempting to escape, is guilty, as a rule, of the same

grade of crime and liable to the same punishment as the prisoner who escapes. This principle applies also to officers who voluntarily permit an escape. If the officer is negligent, simply, he is guilty of a misdemeanor. When a person is imprisoned under a final judgment in a civil action, his escape renders the sheriff, or officer having him in custody, liable to the plaintiff. Consult the authorities referred to under CRIMINAL LAW.

ESCAPEMENT. That part of the machinery of a watch or clock by which the onward revolving motion produced by the moving power, whether weights or spring, is restrained by the time-measuring element, such as the pendulum or balance wheel. The latter allows one tooth of the last wheel in the train of gears to escape or pass the pallets of the escapement at each swing or oscillation. See CLOCK; WATCH.

ESCAPE WARRANT. A warrant authorized by English statutes of 1702 and 1706 for the better preventing of escapes from the Queen's Bench and Fleet prisons. At present it is employed but rarely. A new warrant is not necessary for the rearrest of an escaped prisoner; but the person from whose custody he escapes may pursue and retake him, and may, after notice of his errand and refusal of admittance, break open doors or windows in order to effect the recapture.

ESCARP, or SCARP (Fr. *escarpe*, It. *scarpa*, from Fr. *cscarper*, It. *scarpere*, to cut steep). The side or slope of the ditch next to the parapet. When the ditch of a permanent fortification is dry, the escarp is usually faced with mason work, to render it difficult of ascent; and behind this facing, technically known as revetment (q.v.), there are often casemates (q.v.) for defense. See FORTIFICATION.

ESCARPMENT. See CLIFF.

ESCAUT, a'skô'. The French name for the river Scheldt (q.v.).

ESCHAR, ës'kär (OF. *escare*, Lat. *eschara*, Gk. *ἐσχάρα*, *eschara*, scab). A slough or portion of dead or disorganized tissue. The name is commonly applied to artificial sloughs produced by the application of caustics (q.v.).

ESCHATOLOGY, ës'ká-tôl'ô-jî (from Gk. *ἔσχατος*, *eschatos*, last + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). The doctrine concerning man's existence after death, the future of nations, and the final condition of the world. Even on the lower stages of religious development speculation upon the things to come is not wholly limited to the fate of the individual. The shifting fortunes of war and the varying success in obtaining supplies give rise to anxious or hopeful thoughts of what may befall the tribe. Devastating floods, fires, cyclones, earthquakes, or volcanic eruptions, and terror-inspiring eclipses of the heavenly bodies suggest the possibility of a destruction of the world. But the higher forms of eschatological thought presuppose a more complex social organism and a closer observation of natural phenomena. It is especially myths of astrological origin that furnish material for highly developed eschatologies, and oppression by nations aspiring to world empire that supplies the impulse. Hope of deliverance from galling political servitude springs from a proud and outraged national consciousness, kept alive by the memory of past greatness, and dreams of empire are born of the example set by mighty conquerors and rulers holding nations in subjection. Only prolonged observa-

tion of the movements of the planets and the sun's course through the signs of the zodiac can render possible the thought of a reoccurrence at the end of the present period of the events connected with the world's origin, and a renovation of the world after its destruction. Along the different lines of eschatological speculation there is, therefore, a general development reflecting the growth of man's intellectual and moral perceptions, his larger social experience, and his expanding knowledge of nature. The outward forms, however, vary according to the character of the environment and the peculiar genius of each people, and are also influenced by the relative value accorded to the individual and to the nation or the world. It is seldom that an eschatological idea is found in any people that is without a parallel among other nations, but it is equally rare that the same idea occurs in exactly identical form in different systems of religious thought.

Belief in a survival of the spirit or double, conceived as a material substance, in connection with the dead body as its local habitation as long as food and drink are furnished, gives little opportunity for the imagination. As, with the advance of civilization, the great cosmic forces come into prominence as objects of worship, and the departed spirits are brought into connection with them, the life beyond grows richer; and as the peculiar tribal customs establish a standard of right and the effects of conformity are observed, the spirits themselves are made subject to the same laws of retribution, and a judgment after death is introduced. Through this twofold development the future life may thus be spiritualized and assume a moral character, as in ancient Egypt. But it is also possible for the old conception of a shadowy existence in the grave or a subterranean realm to retain its hold in the main, while a way out of it into larger life, with moral distinctions, is found in the thought of a restoration and reanimation of the old body, thus insuring personal identity, as in Persia and Judaea. Or the spirit may be conceived of as entering immediately upon death into another body, to live again and die and become reincarnated in ever new forms, as in India. This doctrine of metempsychosis renders it possible to introduce into the future life the nicest moral adjustments, implying at once punishments and rewards for conduct in a previous stage of existence and the possibility of rising or sinking in the scale of being according to present conduct. In spite of the perfect justice thus regarded as being administered on every stage of being, this never-ending series of births and deaths may come to appear as an evil, if the present life seems such, and deliverance may then be sought from the infinite wheel of existence in Nirvana. Still another possibility presents itself, when the functions of the mind are considered as indicating a purely spiritual essence independent of the body, having no beginning and no end, as in Greece. This abstract conception of immortality may be made the philosophical basis of a hope for a more concretely conceived personal life after death. For further details of this phase of eschatology, see IMMORTALITY.

The ideas held by different nations as to the future of the human race and the world are only imperfectly known to us. It would, of course, be quite wrong to suppose that such notions have been cherished only where we are fortunate

enough to have testimony as to their existence, or that they have held a place in the life of nations proportionate to their prominence in such literary remains or other accounts as we may possess. But certain inferences can be drawn from the type of eschatological thought that comes to view. When the belief in a coming destruction of the world by a fire or a flood is found among uncivilized tribes in the Pacific, or American aborigines, it is not likely that it originated in astronomical speculation, but rather that it was engendered by some terrifying experience of the past. Though the medium through which the accounts have come makes them somewhat doubtful, it is not impossible that the Spaniards found in Central America the belief in the coming of a white conqueror. If so, the history of the great American civilizations had prepared men for the possibility of the overthrow even of an ancient kingdom, and this apprehension had been fused with the vague rumor of white men who had once settled in the New World. The notion of four great periods of the world, each lasting hundreds of years and ending in a universal conflagration, also presupposes a longer historic development. The remarkable stability of the Chinese Empire and the practical disposition of its people preclude the development of a flourishing eschatology. On the other hand, the brooding genius of India cares little for political independence and is too deeply impressed with the infinite to have its attention absorbed by possible catastrophic changes in the world. There are no last things to claim enthusiastic interest in a pantheistic philosophy that sees in every form of life a manifestation of the divine. But the infinite stretches of divine sway are divided into periods; and these *kalpas*, or epochs, give an eschatological perspective. In the main, however, it is the future of the individual only that occupies the mind of Brahmin and Buddhist alike. Quite different was the attitude of the ancient Iranians. Those who adopted the teachings of Zarathustra seem early to have developed the simple notion of a coming destruction of the world by fire into the idea of a great moral ordeal. As an individual may prove the truth of his religion by undergoing an ordeal of fire, so at the end of the world the worshipers of the lord Mazda will be distinguished from all others by successfully enduring the ordeal of molten metal, and the good will then be recompensed. This conception is found in the Gathas, the earliest part of the Avestan literature. It is not certain that the idea of a resurrection from the dead goes back to the period represented by the Gathas. But Herodotus seems to have heard of such a Persian conception in the fifth century B.C., and Theopompus, the historian of Philip of Macedonia, described it as a Mazdayasnan doctrine in the fourth century B.C., in a work of which excerpts have been preserved by Diogenes Laërtius and Aëneas of Gaza. Whether the resurrection was already at that time connected with the coming of the Saoshyant is uncertain. In the later Avesta it is distinctly the work of the Saoshyant to raise the dead. A final revelation of character, a brief period of punishment in a hell, and an ultimate restoration of all to blessedness, are here assumed. Characteristic of Mazdaism is the idea of a gradual evolution towards a rational and moral end, and of the preparation for this end by the work of the faithful. The world is conceived as lasting

12,000 years. The appearance of Zarathustra falls at the beginning of the last quarter, and at each of the following millenniums one of the three sons of Zarathustra is born, the last of these being Astvatereta, the "restorer of the bodies," or Saoshyant, "the savior." This savior has no political character. After the final conquest of the serpent, Azi Dahaka, the reign of immortality begins. During the period in which the native religion was suppressed and gradually crowded out of its home by Islam, the hope of the persecuted turned to the future, as the apocalyptic sketches in the Pahlavi literature show, and the return of the old King Kai Khosru was ardently desired. The Homeric poems and Hesiod show how the Greek mind occupied itself with the soul's future in the Elysian fields or the darker realms of Hades. Through the Orphic and Eleusinian cults this thought was deepened, and the Christian doctrines of heaven (q.v.) and hell (q.v.) are largely due to Greek speculation. That the future of nations and the world also played an important rôle in Greek thought is evident from the prophecies of the Sibyls. For while the original Sibylline Oracles have not been preserved, the references to them by Heraclitus and Plato reveal their character, and this is also indicated by the imitations in our present Sibylline Oracles. The same source betrays the eschatological thought of the Romans. Some details of Vergil's description of the golden age may indeed have been borrowed from our Pseudo-Sibyl, herself reminiscent of Isaiah; but it is quite likely that the conception itself goes back to a genuine Roman origin. An eschatological mood dominates the epoch ushered in by Alexander's conquests, and Greco-Roman thought is fused with Oriental speculation in the outlook upon the world's future as in other respects. In a similar manner the Scandinavian idea of a destruction of the earth by fire and its subsequent renovation under higher heavens, to be peopled by the descendants of Lif and Liftraser, as set forth in *Völuspá*, no doubt reflects a primitive Germanic conception. Even the twilight of the gods may have belonged to the original myth. But the picture has unquestionably been retouched by Christian hands.

Among the Semitic nations none has probably contributed more largely to the common stock of later eschatological material than the people of ancient Babylonia. Their creation myth and astrology, based on careful observations of the celestial bodies, furnished events to be expected and foretold when times and seasons might be looked for. Nevertheless, such of their literary remains as have been discovered and examined do not permit us to determine what the Babylonians themselves thought of the world's future. It is among peoples to some extent dependent upon their civilization that we find the Marduk-Tiamat myth transferred from the beginning to the end of the world, and the millennial periods of the world's course elaborated. In early Israel the "Day of Yahwe" was a day of battle deciding the fortunes of a people. If the masses looked forward to it as a day of deliverance and victory, men like Amos and Hosea, Isaiah and Micah, Zephaniah and Jeremiah, feared that, the moral conditions being what they were, the advance of Assyria would bring destruction, complete or well-nigh complete, to Israel and Judah. They were prophets of doom. To one of the greatest among them, Jeremiah, this solemn forecast of coming judg-

ment was the criterion of true prophethood. In later times the books containing their oracles were interpolated with prophecies of coming prosperity, which neither reflect their moral attitude nor are in harmony with their historic circumstances. But they are themselves significant signs of the expansion of eschatological hopes. The establishment of the Achæmenian Empire aroused among the Jews expectations of a return from Babylon, the restoration of the temple, and improved social conditions, as Isa. xl-xlviii indicates. During the numerous insurrections that marked the beginning of the reign of Darius Hystaspis, Haggai and Zechariah fanned the hopes of Judæan independence under a descendant of the old Davidic house, the present Governor of Judæa, Zerubbabel (q.v.); and Jer. xxx-xxxi apparently shows that this hope still lived after the death of Zerubbabel and found new nourishment in the great conflict between Persia and Greece. Alexander's phenomenal career, widening the horizons of men, inspired in Judæa, as elsewhere, serious thoughts concerning the destiny of nations. But the strongest impulses to eschatological speculation were furnished by the religious persecution under Antiochus IV Epiphanes and the Maccabean revolt. The Book of Daniel, written 165 B.C., voices the hope that the kingdom of the world will be given to the saints of the Most High, i.e., the Jewish people. Its celestial representative, probably Michael, after the destruction of the beast representing the Greek kingdom, comes with the clouds and receives the empire of the world. There is no Messiah in this apocalypse. The first distinct appearance of this deliverer and king is in the Psalms of Solomon, written soon after the conquest of Palestine by Pompey, in 63 B.C. (See MESSIAH.) During the century that lay between the Maccabean uprising and the final loss of independence to the Romans, the eschatological hopes centred upon the Asmonæan princes, by whom the conquest of the world was expected, as many a psalm in the Psalter testifies. The longing for a descendant of the Davidic line who would break the Roman yoke, establish the empire of the Jews, and rule as a righteous king over the subject nations, grew strong enough in the first century of our era to cause the rebellion that in 70 A.D. led to the destruction of Jerusalem. When Jesus proclaimed the coming of the kingdom of heaven, it is natural therefore that, in spite of His disavowal, He should be understood by some to be a claimant to the kingship of the Jews. Attracted by His wonderful personality, from love of Him and faith in the prophetic word, His disciples were filled with the conviction that He would return as the Messiah upon the clouds of heaven. Apocalyptic writings, such as Fourth Ezra (see ESDRAS, BOOKS OF), Enoch xxxvii-lxxi (see ENOCH, BOOKS OF), and the Jewish originals utilized and expanded in Matt. xxiv (Mark xiii, Luke xxi) and the Revelation of John, show that even in circles where the hopes of the future did not attach themselves to the personality of Jesus, the Messianic idea grew more and more transcendent. It is not probable, however, that the final judgment and the raising of the dead were ever conceived by an adherent of the Jewish faith as functions of the Messiah. While on many points the eschatological ideas of the early Church were far from being fixed, it seems to have been quite generally believed that the end

of the world was approaching; that it would be heralded by angelic trumpet blasts and ushered in by the descent of Jesus as the Messiah from heaven to establish His kingdom; that the living saints would then be translated and the dead in Christ raised to reign with Him for 1000 years; and that after the final conflict with evil the last judgment would be held, the present world would be destroyed by fire, and there would be a new heaven and a new earth in which righteousness should dwell. As Christianity spread, through missionary activity or military conquests, the Kingdom of God was identified with the Church, the doctrine of the millennium was largely abandoned, and eschatology occupied itself chiefly with the future of the individual in heaven, purgatory, or hell. The great creeds of Christendom, however, affirmed the belief in a return of the Son of God to judge the quick and the dead, and a resurrection of the just and the unjust. There does not seem to be sufficient documentary evidence to support the general assumption that about the year 1000 A.D. there was a widespread belief in the impending end of the world. But the famous hymn,

*Dies iræ, dies illa,
Solvat æolum in favilla,
Teste David cum Sibylla,*

leaves no doubt either as to the eschatological mood of mediæval Christianity or as regards the source whence it was nourished. And of this there is testimony in the numerous apocalypses that grew up. It is natural that the biblical language concerning the millennium in Rev. xx and the destruction of the world by fire in 2 Peter should have occupied many minds. The more radical religious movement of the Renaissance period was strongly impregnated with eschatological thought. In the Baptist and anti-Trinitarian churches ardent expectations of the establishment of the kingdom of heaven on earth went hand in hand with the rejection of sacramental magic, devil, and hell, and practical attempts at founding a new social order, with hopes for the ultimate restoration of all souls after a period of unconscious sleep or limited punishment. In the great Lutheran, Anglican, and Reformed churches the rejection of the doctrine of a purgatory and of the intercession of the Virgin and the saints fixed man's destiny irrevocably at death, and therefore tended to render the closing scenes of judgment and resurrection of less practical importance, to eliminate the premillennial coming of Christ, and to make the millennium the result of a long-continued development of Christian life. By an allegorical method of interpretation the natural import of biblical language was lost and scriptural support found for the new outlook upon the future. Since the days of the French Revolution and the career of Napoleon there have been repeated outbursts of eschatological enthusiasm. Where the reaction against allegorical interpretation has not led to the adoption of a historico-critical method, the belief that all biblical prophecies will be fulfilled has engendered an ingenious system of exegesis by which the things expected by the Jews of the Maccabean period or the early Christians to occur in their own lifetime are transferred to the interpreter's own immediate future, some starting point for the new cycle of fulfillments being arbitrarily chosen. Thus, an independent eschatological speculation not unlike that of old

may flourish under cover of biblical authority, and keep alive the expectation of impending judgment upon sin and fundamental changes in man's life and the interpretation of history in the light of eternal purposes.

Islam adopted from Judaism and Christianity the doctrines of a coming judgment, a resurrection of the dead, and everlasting punishments and rewards. Later contact with Persian thought greatly enriched its eschatology. Especially important was the thought of a reincarnation of some great representative in the past of Allah or His prophets. Again and again the world of Islam has been stirred by the expectation of some Imam or Mahdi to reveal more fully the truth or to lead the faithful into a better social condition on earth. Iran and Africa have been most fertile in such movements.

In modern Judaism the return of Israel to its land, the coming of the Messiah, the resurrection of the dead, and everlasting retribution are still expected by the orthodox, while liberals look upon Israel's mission as connected with the regeneration of the human race, and hope for an immortal life independent of the resuscitation of the body.

The criterion of exact science is its capacity to predict future things. In this lies to a large extent the convincing force of astronomical theories through which our modern estimate of the universe has been chiefly formed. A science that unflinchingly foretells future events furnishes a new eschatology by suggesting that the earth's life is but an episode in the never-beginning and never-ending course of nature, and that, barring accidents, this planet must one day end its separate existence in the arms of its celestial parent, the sun. History, in its widest sense, teaches that the future of the human race must grow out of its present life, and that the conditions of humanity, whatever new revolutions may come, are not to be affected by cataclysmic changes wrought from without, but by forces already operating within. By observation of present tendencies it seems to many thinkers possible to predict that warfare will cease; that arbitration will take its place as a means of settling international differences; that competition and monopoly, with the extremes of wealth and poverty to which they give rise, will yield to public administration of industry and commerce for the public good, or some form of co-operation involving a more equitable distribution of the bounties of nature and the products of common toil; that ignorance will be reduced by universal education fitting each individual for the highest service he can render to society; that disease and criminality will be stamped out by preventive and remedial measures; that the conflict between rival sects and religions will end in a fellowship no longer based upon creed or cultic performance, but upon a common interest in the pursuit of truth and righteousness; and that thus the chief blessings associated with the millennium will come, not through a radical change in man's nature wrought by supernatural power, but by a gradual amelioration of the race. Eschatological speculation of this character, already seen in Plato's *Republic* and Thomas More's *Utopia*, has taken a strong hold upon the present generation. In the effort to realize the eschatological dreams of human society as it ought to be by strengthening the movements of thought and life that tend in the right direction, compensation is found by many

for the silence of science concerning a survival of the individual, while they are ready to welcome any light that may be shed upon the mystery of death. See HEAVEN; HELL; IMMORTALITY; INTERMEDIATE STATE; JUDGMENT, FINAL; MILLENNIUM.

Bibliography. An extensive bibliography of the older literature by Ezra Abbot may be found in Alger, *A Critical History of the Doctrine of a Future Life* (New York, 1871). ESCHEAT (Fr. *échoir*, from Lat. *cadere*, to fall out or happen). An incident of feudal tenure of real property, whereby the course of descent from the tenant is obstructed, and the property falls back or reverts to the immediate lord of whom the fee is held. In the common-law system there is, in theory at least, no such thing as absolute ownership of real property. The most extensive estate which one can have, the fee simple, is regarded as a derivative or subordinate estate, held of a superior landlord, to whom in certain eventualities it will return. The fact that in process of time most, if not all, intermediate or mesne lords have been eliminated, and that lands are now held in subordination only to the state, or, in England, to the crown, does not vitally affect this principle. The claim of the state to take lands by escheat is still based upon the theory of a superior lordship or proprietorship, and the holder of land in fee simple is still properly described as a tenant. In order to complete the title acquired by escheat, it is necessary that the superior lord shall perform some act, such as entering

and taking possession of the land or bringing an action at law for its recovery. The principle upon which he thus recovers the property is that, since none but those who are of the blood of the person last seised can inherit, and there are no persons of that blood in being and capable of inheriting, the land must result back to the lord of the fee, of whom it is held.

According to the law of England, escheat was either *propter defectum sanguinis*—i.e., because there were no heirs of the deceased tenant—or *propter delictum tenentis*—i.e., because the blood of the tenant was attainted or corrupted, so that those who were related to him as heirs could not inherit. Such corruption of blood occurred when the tenant was convicted of treason or felony. The rule applied to all felonies and frequently produced much hardship. This form of escheat was peculiar to English law. It is to be carefully distinguished from forfeiture of lands to the crown for treason or felony, which has prevailed in other countries besides England. When this latter penalty was enforced for the crime of treason, the offender forfeited all his lands absolutely to the crown; when it was enforced for any other felony, the forfeiture to the crown was of all the offender's estates for life absolutely, and of all his estates in fee simple for a year and a day, after which they escheated to his immediate lord. (See FORFEITURE.) In English law escheat as a result of conviction of crime is now abrogated; and all forfeiture for crime, except in cases of outlawry, is abolished. (Statute 33 and 34 Vict., c. 23.) It is provided by the Constitution of the United States that "Congress shall have power to declare the punishment of treason; but no attainder of treason shall work corruption of blood, or forfeiture, except during the life of the person attainted." (Art. iii, § 3.) This indicates the policy which has molded the laws of the various States, so that escheat as the result of crime is practically unknown in this country.

Though the feudal system of land tenure existed only in its later and mitigated form in the United States, and though it has been expressly declared to be abolished in some of the States, it continues in many important respects to govern the real-property law and its incidents. By virtue of statutory provisions, generally found in the State constitutions, the title to the property of one who dies without heirs is still transferred to the State in which it is situated, and this transfer is still denominated an escheat. It is the general rule that a proceeding known as "inquest of office" must be instituted, and an office found in behalf of the State, in order to vest in it the title to a decedent's realty. But this is not required in some of the States. See ESTATE; FEE; REAL PROPERTY; TENURE; and the authorities there referred to.

ESCHENBACH, ɛsh'en-bäg, WOLFRAM VON. See WOLFRAM VON ESCHENBACH.

ESCHENBURG, ɛsh'en-böörk, JOHANN JOACHIM (1743-1820). A German literary critic and translator, born at Hamburg and educated at Leipzig and Göttingen. He became tutor in 1767, professor in 1777, and director in 1814 of the Collegium Carolinum in Brunswick. Besides publishing German translations of English writers, notably the first complete German translation of Shakespeare's plays, *Shakespeares theatralesche Werke* (13 vols., 1775-82), he wrote, among many, the hymns "Dir trau' ich, Gott, und wanke nicht" and "Ich will dich noch im

Tod erleben," and was author of: *Handbuch der klassischen Litteratur, Altertumskunde und Mythologie* (1783; 8th ed., 1837); *Entwurf einer Theorie und Litteratur der schönen Redekunst* (1783; 5th ed., 1836); *Beispielsammlung zur Theorie und Litteratur der schönen Wissenschaften* (8 vols., 1788-95); *Lehrbuch der Wissenschaftskunde* (1792; 3d ed., 1809); *Denkmäler altdeutscher Dichtkunst* (1799).

ESCHENMAYER, ɛsh'en-mi-er, KARL AUGUST VON (1768-1852). A German metaphysician. He was born at Neuenburg, and was professor of practical philosophy at the University of Tübingen from 1818 to 1836. He studied and taught philosophy from the standpoint of Schelling (q.v.), his mystical tendency expressing itself in the assertion that one must advance beyond philosophy into nonphilosophy, a realm where not "speculation, but faith," holds sway. He took a deep interest in animal magnetism. His feelings found expression in violent polemics against the theories of Hegel and Strauss and in fanciful dreams of the spirit world. Among his writings are: *Die Philosophie in ihrem Ueber gange zur Nichtphilosophie* (1803); *Psychologie* (1817); *System der Moralphilosophie* (1818); *Religionsphilosophie* (1818-24); *Mysterien des innern Lebens* (1830); *Grundriss der Naturphilosophie* (1832); *Betrachtungen über den physischen Weltbau* (1852).

ESCHER, ɛsh'er, JOHANN HEINRICH ALFRED (1819-82). A Swiss statesman, born at Zurich. He studied law in his native town and at Bonn, Berlin, and Paris. In 1844 he was elected member of the Grand Council of the Canton. Even at that early period his sentiments were decidedly liberal. In January, 1845, together with six others, who shared his opinions, he published the famous summons to the popular assembly in Unterstrass, demanding the expulsion of the Jesuits. He was elected to the Council of the Interior in 1845 and to the Council of Education in 1846. The reorganization of the schools in the Canton of Zurich was his chief work, and he succeeded in introducing modern methods into the system of secondary education. In December, 1847, he became President of the Grand Council, and the following year he was sent as a deputy to the Federal Diet. In December of the same year he became President of the newly elected Cantonal Administrative Council. His energies were directed to the promotion of education, but he also furthered railway enterprise and banking institutions in Switzerland. He was President of the National Council in 1849, Vice President of the Confederation in 1856-57 and 1861-62, and became subsequently several times President. He died Dec. 6, 1882, at Zurich, where a bronze statue has been raised to his memory. Consult Scherr, *Alfred Escher* (1883).

ESCHERICH, ɛsh'er-ik, KARL LEOPOLD (1871-). A German entomologist, born in Schwandorf and educated at Munich, Witzsburg, Leipzig, and Heidelberg. From medicine he turned to zoölogy and traveled in Tunis (1892), Central Asia Minor (1895), Algeria (1898, 1902), Abyssinia (1906), Ceylon (1910), and North America (1911). In 1901-06 he was privatdocent at Strassburg, and in 1907 became professor in the Forestry Academy at Tharandt. He wrote: *System der Lepismatiden* (1905); *Die Ameise* (1906); *Ferrenreise nach Brythrea* (1908); *Die Termiten oder weissen Ameisen* (1909) and *Termitenleben auf Ceylon*

(1910), singularly interesting and valuable studies; *Die angewandte Entomologie in der Vereinigten Staaten* (1913); *Die Forstinsekten Mitteleuropas*, vol. i (1913).

ESCHER VON DER LINTH, ɛsh'ər fən dər lənt, HANS KONRAD (1767-1823). A Swiss statesman, born at Zurich. After study at Göttingen (1786-88) and extensive travel, he was a member of the Legislative Assembly of the Helvetic Republic in 1798-1802. In 1798-1801 he edited the *Schweizerischer Republikaner*. In 1802 he withdrew from politics, and from 1807 to its completion in 1822, as president of the board of inspection, directed the improvement of the Linth, the upper course of the Limmat, by means of a canal. A large tract of land was thus reclaimed to useful purposes. Escher was regarded as a benefactor of the commonwealth, and the surname Von der Linth was officially granted to his family in 1823. Consult the biography (Zurich, 1852) by Hottinger.

ESCHRICHT, ɛsh'rikt, DANIEL FREDERIK (1798-1863). A Danish physiologist and zoologist. He was born at Copenhagen, studied medicine there, and after practicing as a physician for three years, took a supplementary course in physiology and comparative anatomy in Germany and France. He was professor at Copenhagen from 1836 until his death, when his valuable collection was acquired by the Zoological Museum. His investigations covered an extensive field. Among his principal publications are *Haandbog i Physiologie* (new ed., 1851) and *Føllelige Foredrag* (1855-59).

ESCHSCHOLTZ, ɛsh'shólts, JOHANN FRIEDRICH (1793-1831). A Russian naturalist and traveler. He was born at Dorpat, where he studied medicine. In 1815 he made a tour of the world with Otto von Kotzebue and Adelbert von Chamisso, collecting a great number of zoological specimens and making important scientific investigations. The results of this voyage were published in Kotzebue's *Entdeckungsreise in die Südsee und Beringstrasse* (1821), to which Eschscholtz contributed a number of valuable articles. After his return in 1819 he was appointed extraordinary professor of anatomy in Dorpat, and in 1823 he again accompanied Kotzebue on a voyage around the world. The extensive collection acquired during these tours was presented by Eschscholtz to the University of Dorpat in 1826. He later published a catalogue of the 2400 animals of this collection in vol. ii of Kotzebue's *Neue Reise um die Welt* (1830). A botanical species, *Eschscholtzia*, was named in his honor by Chamisso, and Eschscholtz Bay, an inlet of Kotzebue Sound, on the coast of Alaska, perpetuates his achievements as an explorer. His principal work is the *Zoologischer Atlas, enthaltend Abbildungen und Beschreibung neuer Tierarten* (5 parts, 1829-33).

ESCHSCHOLTZIA, ɛsh'shólts'i-á (Neo-Lat., named in honor of J. F. Eschscholtz, a Russian naturalist and traveler). A genus of plants of the family Papaveraceae. *Eschscholtzia californica*, the California poppy, and other species, natives of California and Arizona, have now become very common in our flower gardens, making a showy appearance with their large deep-yellow flowers. This plant has a remarkable calyx, which, much resembling in its form the extinguisher of a candle, separates from the dilated apex of the flower stalk and is lifted and thrown off by the expanding flower. For illus-

tration, see Plate of CALIFORNIA FLORA, and Plate of POPPY AND PEPPER TREE.

ESCHWEGE, ɛsh'vá-ge (medieval *Eskencveg*, *Dschincancl*). A town of the Prussian Province of Hesse-Nassau, situated in a fertile valley of the Werra, 25 miles east-southeast of Cassel (Map: Prussia, D 3). It consists of an old and a new town, on the left and right banks of the river respectively, and a suburb on an island connected with the mainland by two stone bridges. The castle, erected about 1386, is now occupied by the district court. The so-called Black Tower is all that remains of the convent founded by Charlemagne. Eschwege is an important industrial centre. It has large tanneries, manufactures of woolen, cotton, and linen goods, hair-cloth, soap, cigars, brushes, shoes, and machines. It has large slaughterhouses and does a large business in pork and sausage. Pop., 1900, 11,117; 1910, 12,542.

ESCHWEILER, ɛsh'ví'lər. A town of the Prussian Rhine Province, on the Inde, about 8 miles northeast of Aix-la-Chapelle (Map: Prussia, B 3). It is the centre of a rich mining district, its coal mines being noted for their great depth and superior quality of product. Cadmium, zinc, copper, and lead are also mined, as they have been from the days of the Romans. The manufactures comprise boiler plate, iron pipe, wire, tin plate, wheels, boilers, machinery, miscellaneous articles of iron, copper, zinc, and lead, confections, belting and leather goods, bricks, malt and beer. Pop., 1900, 21,895; 1910, 24,718.

ESCLOT, BERNAT. See DESCLOT.

ESCOBAR Y MENDOZA, ɛs'kô-bär' é mën-dô'thà, ANTONIO (1589-1669). A Spanish Jesuit and casuist, born at Valladolid. He was accused of founding the doctrine that the moral value of actions lies in the nature of the intention; in other words, that purity of purpose may be justification for actions contrary to the moral code and contrary to human laws. His casuistry was severely criticized in the *Provincial Letters* of Pascal, and his doctrines were disproved by many Catholics and gently censured by the authorities at Rome. Under the witty ridicule of such French writers as La Fontaine, Boileau, and Molière the name of Escobar, a priest of exemplary life, was used for coining the word *escobarderie*, a synonym for extreme laxity in moral principle. Among his writings are *Liber Theologiae Moralis* (London, 1646) and *Summula Casuum Conscientiae* (Pamplona, 1626).

ESCOBEDO, ɛs'kô-bá'dô, MARIANO (1827-1902). A Mexican soldier, born at Dos Arroyos, Nuevo León. He was originally a mulatto, took part in the Mexican War, became prominent in the "War of the Reform," was in 1859 appointed a colonel by Juárez, and contributed largely to the success of the Republican cause. Upon the establishment in Mexico of the ill-fated Empire of Maximilian, he withdrew to San Antonio, Tex., organized a republican force made up of Mexican refugees, ex-Confederate soldiers, and negroes, and in 1865 captured the garrison of Monterey. In 1867 he utterly defeated Miramón at San Jacinto and was appointed commander in chief of the republican armies, with rank of general of division. On May 15 of that year he took Querétaro and captured the Emperor Maximilian. In 1875-76 he supported President Lerdo de Tejada against

the revolution under General Diaz, served Lerdo as Minister of War, escaped to New York, and was afterward active in conspiracy against the Diaz government, but in 1882 accepted the office of president of the supreme military court of justice. He retired in 1884.

ESCOQUIZ, ɛs'kō-s-keth', JUAN (1762-1820). A Spanish churchman, politician, and author, born in Navarra or at Bermeo in Biscaya—accounts vary. He became the instructor of the future King Ferdinand VII and gained an ascendancy over his pupil that lasted for many years. After the abdication of Charles IV (1808) Escoiquiz was made Counselor of State; he accompanied Ferdinand to Bayonne and saw him fall into the trap so skillfully set by Napoleon (1808). During the devastating War of the Peninsula he remained in France. Upon the return of the King to power he was made Minister, but soon fell into disgrace, and afterward was exiled to Ronda, where he died. He wrote *Idea sencilla de las razones que motivaron el viaje del rey Fernando VII á Bayona* (1814), which is an important historical document; and a translation of Young's *Night Thoughts* (1797) and of *Paradise Lost* (1813).

ESCOLAR' (Sp. scholar). A mackerel-like fish (*Ruvettu pretiosus*) of tropical parts of the Atlantic in deep water, and well known in the Mediterranean, where it is called by the Italians rovetto or ruvetto. It is not much valued in Europe, but is highly regarded in the Antilles, and especially in Cuba, where the fishermen make a business of catching it between the disappearance of the spear fish and the coming of the red snappers. Its extreme oiliness and its rough skin have caused it to be called oilfish and scourfish along the Gulf coast. The term "escolar" is applied by ichthyologists to the whole family (Gempylidae) which this fish represents.

ESCORIAL, *Span. pron.* ɛs-kō-rí-ál' (Sp., from *escoria*, slag, from Lat. *scoria*, Gk. *σκόρια*, *skōria*, slag). A celebrated building in Spain (El real monasterio de San Lorenzo del Escorial), comprising a monastery, church, college, tomb, and palace. During the battle of San Quentin, won by the Spaniards on St. Lawrence's Day (Aug. 10), 1557, a church dedicated to that saint was destroyed. In fulfillment of a vow of gratitude to St. Lawrence for the victory, Philip II built the Escorial on a bleak height of that name, 2700 feet above the sea, about 27 miles northwest of Madrid, and dedicated it to St. Lawrence. Begun by the architect Juan Bautista, of Toledo, in 1563, and completed in 1584 by Juan de Herrera, his pupil, it is not only the largest building in Spain, but also the most notable monument of the Griego-Romano style in Spain. Externally without artistic merit except for the fine dome of the church and the picturesque grouping with it of the six towers which vary the silhouette of the whole, it is remarkable for the ingenuity of its vast plan and the grand scale of the church. The Escorial occupies a rectangle of 750 by 580 feet, with a projecting wing on the rear or east side of about 175 by 120 feet, and comprises 13 courts, producing a fancied resemblance to the gridiron of St. Lawrence. The church, which dominates the entire design, fronts on a central court, entered from the west by the main portal, which is opened only to admit the King on his first visit, and a second time to receive his body for burial. The church is a noble design, 340 feet long by 234 wide, cover-

ing an area of 70,000 square feet, and crowned by a central dome 70 feet in diameter and 320 feet high externally. The interior of the church is of dark marble; previous to the destructive occupation by the French in 1808 it was rich in works of art. Its chief treasure is a life-size crucifix of ivory by Benvenuto Cellini (q.v.). From a small room in the adjoining palace wing Philip II, when sick and dying, was accustomed to listen to the celebration of the mass through a grated window opening into the chancel. Below the high altar of the church is the Pantheon, or royal tomb, an octagonal chamber with niches containing black sarcophagi in which rest the bodies of all the kings of Spain since the Emperor Charles V, with the exception of Philip V and Ferdinand VI. The palace of the Escorial was formerly rich in treasures of painting and contained works of Raphael, Rubens, Velasquez, Titian, and Tintoretto. The library, which was under the care of the monks of St. Jerome (driven out by the French), comprised 30,000 volumes and 4500 manuscripts, concerned mostly with Arabic literature. The Augustinian monks have been in charge of the conventual buildings since 1885. The Escorial has suffered many vicissitudes; fire in 1667, plunderings by the French in 1808 and 1813, and severe injury by fire from lightning in 1872 have necessitated extensive repairs.

Bibliography. Los Santos, *Descripción del real monasterio de San Lorenzo del Escorial* (Madrid, 1657); A. Rotondo, *Historia artística . . . del monasterio de San Lorenzo* (Madrid, 1856-61); A. F. Calvert, *The Escorial: A Historical and Descriptive Account, etc.*, with 278 illustrations (London and New York, 1907). The emotional effect produced by the building is well described in C. Quinet, *Vacances en Espagne* (Paris, 1846); and John Hay, *Castilian Days* (New York, 1875).

ES'CORT (Fr. *escorte*, It. *scorta*, guide, from *scorgere*, to guide, from Lat. *ex*, out + *corrigere*, to correct, from *con*, together + *regere*, to direct). In the United States army ceremonial escorts are of two kinds—escorts of honor and funeral escorts. Escorts of honor are picked bodies of troops, detailed to receive and escort personages of high rank, civil or military. The troops assigned for this duty may be composed of cavalry, artillery, or infantry, but are invariably selected for their soldierly appearance and superior discipline. An officer is also detailed to attend the personage escorted and bear communications from him to the commander of the escort. The strength and character of such escort is largely determined by the status of the personage escorted. Funeral escorts are bodies of troops in numbers appropriate to the rank and grade of the deceased, detailed to attend and escort the funeral cortège, as may be ordered. The United States Army Regulations (1913) order that for the funeral escort of the Secretary of War, or general of the army, a regiment of infantry, a squadron of cavalry, and one battalion of field artillery form the detail; for the Assistant Secretary of War or the lieutenant general, a regiment of infantry, a squadron of cavalry, and a battery of field artillery; for a brigadier general, a regiment of infantry, a troop of cavalry, and a platoon of field artillery; for a colonel, a regiment; a lieutenant colonel or major, a battalion

or squadron; a captain, one company; a subaltern, a platoon; a noncommissioned staff officer, 16 men under a sergeant; a sergeant, 14 men under a sergeant; a corporal, 12 men under a corporal; a private, 8 men under a corporal; an enlisted man of field artillery, one section. The coffin is carried on a caisson, as a rule. Six pallbearers are selected from the grade of the deceased, as far as practicable. The above are escorts of ceremony. Escorts, in the sense of bodies of troops used as guards or protecting forces, are also employed with armies in the field; e.g., the infantry or cavalry escort of field artillery, escorts and guards for the supply trains in rear of an army, escorts and guards for a "convoy of prisoners," etc. Such escorts vary in strength from a few men to entire organizations and are often composed of two arms, usually cavalry and infantry.

ESCOSURA, ɛs'kò-sò'ra, PATRICIO DE LA (1807-78). A Spanish statesman and author, born in Madrid. Early imbued with the revolutionary spirit rampant in the Spain of his day, Escosura was obliged to leave his country and study abroad. Upon his return he took to literature and published two successful novels, somewhat in the manner of Walter Scott—*El conde de Candespina* (1832) and *Ni rey, ni roque* (1835). Banished for his Carlist sympathies, he afterward became Undersecretary of State, Minister of the Interior, and Ambassador to Germany (1872). In 1876 he was elected a member of the Spanish Royal Academy. His most important works are: *Estudios históricos sobre las costumbres españolas* (Madrid, 1851); *Historia constitucional de Inglaterra* (1859); *La España artística y monumental* (1842-50); several plays, such as *La corte del Buen-Retiro* (1837); *Las mocedades de Hernán Cortés* (1846); *Bárbara Blomberg*; *Don Jaime el Conquistador*; *Roger de Flor* (Barcelona, 1861, two tomes in one quarto volume, illustrated).

ESCRIBANO, ɛs'krè-bà'nò. See HALFBREAK.

ESCRIBED CURVE (from Lat. *e*, out + *scribere*, to write, draw). A curve externally tangent to the sides of a polygon; e.g., an escribed circle of a triangle is tangent to one

ESCRIBED CIRCLE.

side and to the other two produced. The bisectors of the interior and exterior angles of a triangle intersect by threes in four points, of which the exterior ones are the centres of the escribed circles of the triangle. For example,

O is the centre of an escribed circle of the triangle *ABC* in the preceding figure.

ES'CROW' (AF. *escroue*, OF. *escroue*, *escroe*, bond, Fr. *écrou*, entry in a jail book, from MDutch *schroode*, AS. *scréade*, shred, slip of paper, Eng. *screed*). A sealed instrument, placed in the hands of a third person to be kept by him until certain conditions are satisfied, and then to be delivered over to the obligee or grantee. While in the hands of the third person, awaiting fulfillment of the prescribed conditions, the instrument is not a perfect deed and does not operate as an obligation or a conveyance. As a rule, it takes effect from the second delivery. Hence, if it is a deed of property, the ownership passes from the grantor to the grantee as of the date of such delivery. But an exception to this rule is made when justice requires, or when necessary to protect the rights of persons who are not parties to the transaction. For example, if the grantor becomes mentally or legally incapacitated between the delivery to the third person and the delivery by the latter to the grantee, the deed will take effect as of the date of its first delivery, in order that it may be rendered valid. This is accomplished by the legal fiction of "relation." In order to uphold the deed, the act of final delivery is viewed as having been done at the time of the conditional delivery—as relating back to that date. See DFEED; DELIVERY.

ES'CUAGE. See SCUTAGE.

ESCUERZO. See FERREIRO.

ESCUINTLA, ɛs-kən'tlá. A town and capital of the department of the same name, Guatemala, 30 miles southwest of the city of Guatemala (Map: Central America, B 3). It is the centre of a district growing sugar cane, coffee, and cacao, and has considerable transit trade owing to its situation on the railroad from Guatemala to the port San José. Escuintla is a noted resort, frequented by great numbers of persons for its baths. Pop., 1910 (est.), 14,000.

ESCU'LAPIANS. A Catholic order, historically connected with the work of Joseph Calasancius (1556-1648). He was born in Aragon, was ordained a priest in 1583, went to Rome in 1592, and became interested in the education of poor and neglected children. Pope Clement VIII sustained his efforts, and in 1602 he laid the foundations of an order, the Piarists, devoted to this work. In 1614 the Esculapians were founded in Rome and have given themselves to education. In 1905 they had 2137 members and directed 150 colleges. In Cuba they have a college at Guanabacoa. In 1889 another order, the Pious Workers of St. Joseph Calasancius, was founded at Vienna, for education and works of charity, especially among workmen.

ES'CULENT SWALLOW. See SALANGANE.

ESCURIAL. See ESCORIAL.

ES'CUTCHEON (formerly *scutcheon*, from OF. *escusson*, Fr. *écusson*, from OF. *escu*, *escut*, Fr. *écu*, shield, from Lat. *scutum*, shield). A term in heraldry (q.v.), synonymous with shield. An escutcheon of pretense, or inescutcheon, is a small shield placed in the centre of the larger one and covering a portion of the charges on the latter, in which a man carries the arms of his wife when she is the heiress of her family. It is said to be carried *surtout*, or over all. Sometimes also a shield over all is given as a reward of honor.

ESDRAELON, ɛs-drà-él'on or ɛs-drà-él'on

(Gk. Ἑσδράων, *Esdrēlōn*, the Greek form of the Hebrew word rendered as Jezreel in the English Bible, meaning "God has sown"). The greatest plain in Palestine, separating the mountain ranges of Galilee from those of Samaria, watered by the Kishon (Map: Palestine, C 2). It may be described as a triangle, having for its base the high hills—of which Mount Gilboa is the most important—forming the watershed between the Jordan and the Kishon, extending north and south from Nazareth to Jenin, a distance of about 15 miles. The northern boundary is the hills of Galilee westward from Nazareth about 12 miles to a point where the Kishon breaks through in a narrow pass leading to the seacoast and Acco. On the southwest is the Carmel range, extending from the sea to Jenin, about 20 miles. The plain was allotted to Issachar in the division among the tribes (Josh. xix. 17-23). It is of great fertility and has been of much importance in the annals of Palestine. Armies and caravans from all directions must pass through it, and, owing to its level character, it naturally became the field on which were fought the decisive battles for the possession or defense of Palestine and Syria. It was the scene of the triumph of Barak over Sisera (Judg. iv) and of Gideon over the Midianites (Judg. vii), as well as of the final defeat of Saul by the Philistines (1 Sam. xxxi) and of Josiah by Pharaoh Necho of Egypt (2 Kings xxiii. 29-30). The great contest between Elijah and the prophets of Baal is said to have taken place on its western border (1 Kings xviii. 17 et seq.). It was through the plain that Jehu came riding to Jezreel (2 Kings ix. 16 et seq.). The armies of Assyria and Egypt met there repeatedly, and in modern times the plain has figured in the wars of Napoleon. It has been supposed that this plain is referred to in Revelation as the battlefield par excellence, where "the kings of the earth and of the whole world" were to gather for the battle of the great day of God (Rev. xvi. 14, 16); but it is possible that "the place called in Hebrew Har-Magedon" is named after some chthonic divinity originally belonging to the mythical lore of Babylonia. Consult George Adam Smith, *Historical Geography of the Holy Land* (New York, 1895). See ARMAGEDDON.

ESDRAS (Gk. Ἑσδρας, *Ezra*), BOOKS OF. In the Latin Vulgate there are four books of Esdras. Two of these correspond to the canonical books of Ezra and Nehemiah; two are not regarded as canonical. As the last of them contains two chapters prefaced to the Apocalypse of Ezra and two chapters added at the end, it has been proposed to designate these as the fifth and sixth books of Esdras. The present confusion in regard to the titles of these books arises from the different order in the Greek version. A desirable uniformity may perhaps be brought about most easily by adhering to the nomenclature of the Vulgate, but using V Esdras for chaps. i and ii, and VI Esdras for chaps. xv and xvi of the Latin. The books would then be:

I **ESDRAS**, the Greek translation of the Hebrew and Aramaic canonical Book of Ezra substantially in the form it has in our Masoretic text. This is supposed by some scholars to be the original Greek version. Others maintain that, as in the case of the Book of Daniel, Theodotion's version was substituted for the earlier translation, and that I Esdras is the work of this translator living in the second century A.D.

Whether this be so or not, it is significant that in the Greek manuscripts I Esdras appears as the first part of Esdras B.

II **ESDRAS**, the Greek translation of the canonical Book of Nehemiah substantially in the form it has in our Masoretic text. In the Greek manuscripts it appears as the second part of Esdras B, and as to its origin the same opinions are held as in the case of I Esdras.

III **ESDRAS**, a Greek translation of the books of Ezra and Nehemiah. Because of the marked difference in the order of the chapters in some parts, the additional story of Darius and the Three Pages, and some other peculiarities, this has been regarded as a later and independent rendering, of less value than I and II Esdras. But many eminent scholars look upon it as the oldest of our Greek versions, and consider its order as more likely to have been the original one, the story of Darius and the Pages as an interpolation, and the fact that this version was given the first place as Esdras A in the manuscripts as important. In early English Bibles the designation used by the Vulgate was followed; the Geneva Bible of 1560 followed the Greek and called it the First Book of Esdras, and that has often been done since then. It has its disadvantages, however, and the usage of Jerome may be adhered to without any agreement with his views as to its later date and inferior character being implied. On III Esdras, consult especially: Howorth, in *Proceedings of the Society of Biblical Archaeology* (1901-02); Torrey, *Ezra Studies* (Chicago, 1910); Cook, in Charles, *The Apocrypha and Pseudepigrapha of the Old Testament* (2 vols., Oxford, 1913).

IV **ESDRAS**, an apocalypse ascribed to Ezra. It is extant in Latin, Syriac, Ethiopic, two Arabic, Armenian, and fragments of Saïdic and Georgian versions. The Greek translation from which these were made has not been found. Yet all recent investigators are agreed that even this Greek text cannot have been the original, but that the author, or authors, wrote either in Hebrew or Aramaic, and probably in Hebrew. There is every reason to believe that a Salathiel apocalypse has been used by the author who writes in the name of Ezra. The opening statement "I, Salathiel, who am also Ezra" (iii. 1) is most naturally explained as coming from a compiler, who particularly in iii-x used the Salathiel apocalypse, written, as iii. 1 shows, in the thirtieth year of the downfall of the city, or in 100 A.D. As the eagle vision (chaps. xi, xii) can scarcely be earlier than the time of Domitian, and chaps. xiii, xiv clearly come from the same author as the vision of the eagle, the present work probably goes back to two sources united at the beginning of the second century A.D. This work has sometimes been called the Second Book of Esdras. Consult especially: Hilgenfeld, *Messias Judæorum* (Leipzig, 1869); Volkmar, *Das vierte Buch Ezra* (Tübingen, 1863); Violet, *Die Ezra-Apokalypse* (Leipzig, 1910); Kahisch, *Das vierte Buch Ezra* (Göttingen, 1889); Gunkel, *Das vierte Buch Ezra* (Tübingen, 1900); Box, *The Ezra-Apokalypse* (London, 1912); Székely, *Bibliotheca Apocrypha* (Freiburg, 1913).

V **ESDRAS**, chaps. i and ii of the Latin IV Esdras, a Christian addition which treats of the rejection of the Jewish people by God and His choice of Gentile Christians. It is sometimes called II Esdras in Latin manuscripts.

VI ESDRAS, chaps. xv and xvi of the Latin IV Esdras, a Jewish addition containing chiefly invectives against sinners with predictions of wars and disasters. It is sometimes called V Esdras in Latin manuscripts. Consult the editions of Hilgenfeld and Volkmar. See APOCRYPHA.

ESERINE. See CALABAR BEAN; ALKALOIDS.

ESH'ER, WILLIAM BALIOL BRET, first VISCOUNT (1815-99). An English jurist. He was educated at Westminster and at Caius College, Cambridge, and was called to the bar in 1840. He sat in Parliament during 1860-68 and then became Solicitor-General, but was in the same year appointed a justice of the Court of Common Pleas. He was a lord justice of appeal from 1876 to 1883 and then became Master of the Rolls. He was knighted in 1868, and raised to the peerage in 1897, at the time of his retiring from the bench. His judgments as Master of the Rolls are highly esteemed and constitute a valuable contribution to the development of equity jurisdiction.

ESK. The name of a small Scottish river of Dumfriesshire, formed by the confluence of the Black Esk and White Esk, which rise on the borders of Selkirkshire, near Ettrick Pen. It runs 35 miles south and forms for a mile the boundary between Scotland and England (Map: Scotland, E 4). For the last 8 miles it runs south-southwest through Cumberland, England, ending in the Solway Firth. It flows through some charming scenery, past Langholm, Canobie, and Longton. The upper part of its valley is called Eskdale Muir.

ES'KERS, ES'KARS, or ES'CHARS (Ir. *eiscir*, ridge). The name given in Ireland to large heaps of gravel that were accumulated during the Pleistocene period. They are identical with the *åsar* of Sweden and resemble kames (q.v.), but are longer and follow a winding course. The gravel is often heaped into narrow ridges 40 to 80 feet in height and from 1 to 20 miles in length. Similar winding ridges of gravel and sand are found in northern North America, where they are often associated with broad level-topped deposits of sands and gravels closely resembling river deltas. This association and their peculiar structure and configuration have led to the belief that eskers are deposits formed by streams which flowed beneath the ice sheets of the Glacial period. In general the eskers follow the direction in which the continental glacier moved.

ESKILSTUNA, *ës'kils-tö'nä* (Swed., Eskil's town). A city of Sweden, situated on both sides of the Eskilstunaä, over 60 miles west of Stockholm (Map: Sweden, F 7). The town, divided into old and new sections by the river, is regularly built in the new quarter, and is famed for its iron and steel manufactures, especially the gun factory on an island in the river. The town manufactures fine cutlery. There is regular communication with Stockholm by steamship as well as by rail. Pop., 1900, 13,663; 1912, 28,485. Eskilstuna is named after St. Eskil, the English apostle of Christianity in Södermanland, who is supposed to have been buried here after his martyrdom.

ESKIMO. A race confined to the Arctic regions of America and the extreme northeastern part of Asia. The name means "raw-fish eaters" and was applied to them by their Algonquin Indian neighbors living south of them. The American Eskimo call themselves Innuits,

i.e., men; their congeners in Asia giving themselves the name Yuit or Yu-kouk, other forms of the same word. The Eskimo have been so absolutely secluded in their habitat that anthropologists have had great trouble in dealing with the question of their origin. Dr. H. Rink, who made a life study of Greenland and its people and is the greatest authority on them, held that most Eskimo weapons and implements are of American origin; he advanced the theory that, even though the Eskimos originally may have come from Asia, they developed as a race in the interior of Alaska, whence they finally migrated northward and spread out along the coasts of the ice sea. He said that their speech is closely connected with the primitive dialects of America, while their legends and customs resemble, or at least suggest, those of the Indians. Later the researches of Dall, Olivier, Nordquist, Krause, and others led to the conclusion that the Eskimo were derived directly from peoples of the Asiatic polar regions, some of whom came to America across the narrow Bering Strait. Within recent years the investigations of Hrdlicka, Boas, and others have borne out the early view of Rink, since anatomically as well as culturally the Eskimo seem to have sprung from the same stock as the Indians.

Though the evidence as to the origin of the Eskimo is not complete, there is at least good reason for the theory that within a comparatively recent period they developed their individuality either on the north Atlantic coast of North America or in the vicinity of Hudson Bay, from whence they spread into Greenland and Alaska, the Aleutian Islands, and parts of Siberia. They must have reached Greenland before the Norwegian colonies of Österbygd and Vesterbygd were established, for Eric the Red and others found in both these districts the ruins of human habitations, fragments of boats, and stone implements, which they thought must have belonged to a feeble folk whom they therefore called *Skrellings* (weaklings). Nansen and others believe that at this period the Greenland Eskimo were living north of 68° N., where seals and whales abound, and that they did not make their permanent settlements in South Greenland until after they had destroyed the Norwegian colonies there in the fourteenth century.

The regions inhabited by the Eskimo extend from Bering Strait over the northern coast of America and its groups of Arctic islands to the east coast of Greenland. With a habitat spreading over 3000 miles, the Eskimo have a wider geographical range than any other aborigines. In spite, however, of the great distances, which have divided the various groups from one another for probably more than 1000 years, the race has preserved the most striking uniformity in language, habits, and mode of life, excepting in so far as certain tribes have been influenced by contact with the white men. The insignificant differences of language among these isolated groups have been often remarked. Common to all are the same stem words, the same affixes. The chief characteristic of the language is that it is highly polysynthetic, single words of complex structure expressing ideas that in English would fill out whole sentences. Mr. Hugh Lee, who learned the language among the Smith Sound natives of north Greenland, says that he had little difficulty in communicating with the Eskimo of Cape Prince of Wales, Alaska.

A similar condition has been observed among the Eskimo of Labrador, the Arctic archipelago, and Greenland, though dialectic differences exist between the various groups and villages. However, the Aleutians are so far removed as to make their speech unintelligible to the mainland natives.

The uniformity of language is not so great, however, as to preclude the linguistic classification of the Eskimo. In the first place, we have two distinct divisions, the Aleutians and the Eskimo proper. The former is a small compact group and may be treated as a unit; the latter, on the other hand, is a widely distributed people with many cultural subdivisions. According to culture these seem to fall in the following divisions:

1. *The Greenland Eskimo.* Occupying the lower part of Greenland and in two groups, those of the east coast, now extinct, and those of the west coast, who have become civilized.

2. *The Central Eskimo.* Including those of Smith Sound in north Greenland, made famous by Peary; those of eastern and northern Baffin Land; those of western Hudson Bay; on Boothia Felix; and the now extinct people of Southampton Island.

3. *The Eskimo of Labrador.* Extending along the coast from near Newfoundland to Hudson Bay and including a few settlements on the southern shore of Baffin Land.

4. *The Eskimo of Banks Land.* Including those on Victoria Island and Coronation Gulf, recently visited by Stefansson.

5. *The Mackenzie River Eskimo.* Those at the mouth of the Mackenzie and along the coast between Cape Bathurst and Herschel Island.

6. *The Alaskan Eskimo.* All those in Alaska except the Aleutians.

7. *The Siberian Eskimo.*

Our knowledge of divisions four, five, and six is still rather vague, so that the above grouping must be considered tentative. For the other groups, however, we have sufficient data to make the classification definite.

No satisfactory estimate of the number of living Eskimo can be made. According to the census of 1910 the Aleutians numbered 1451 and the Alaskan Eskimo 12,636. The Greenland Eskimo are estimated at 10,000, and it is unlikely that all the others will total 9000. See ALASKA.

The Eskimo are between 62 and 64 inches in height, with broad, round faces and high cheek bones. They are well built, usually fat, and many of the men have remarkable muscular development; the eyes are narrow, the hair is straight and jet black, the beard is very thin and often entirely wanting. The skin is light brown or dark brown. They are a short-lived people, rarely attaining an age much beyond 60 years. In Greenland and Alaska they have mixed with the whites until there is a very large percentage of mixed bloods. Note should also be taken of the peculiar "blond" or "white" group discovered by Stefansson, near Coronation Gulf. (See WHITE ESKIMOS.) All the groups, excepting those which have long had intercourse with the white race, may be classed in point of development with the prehistoric races of the age of ground-stone tools, though the Smith Sound natives, long before they met the whites, obtained iron from the Cape York meteorites, with which they tipped their weapons. This tribe, and indeed all the Greenland

Eskimo, have no wood except such fragments of driftwood from Siberia as they have picked up on the shore and such pieces as they have obtained from white men.

The sustenance of the Eskimo is chiefly derived from the capture of seals and cetaceous animals, the pursuit of which has kept them inhabitants of the seashore. The seal is their staple winter food and their most valuable resource, supplying them with dog food, clothing, boats, tents, harpoon lines, light, and heat. The walrus, narwhal, whale, bear, and to a smaller extent the deer, fox, and hare, also afford important supplies. Thousands of birds are stored for winter use. In summer caribou are hunted, the skins of which furnish the clothing for the next winter.

The men are constantly employed in hunting or in the manufacture and care of their hunting contrivances, among which is the kayak, in which they chase their sea prey. The kayak is a swift and seaworthy canoe, made of skin, entirely decked over except for the round hole in the middle in which its one occupant sits. It is propelled by a double-bladed paddle. The oomiak (umiak), or woman's boat, also built of skin, but open, is large enough to carry several passengers and also freight. It is paddled by women. The harpoon is a remarkably ingenious implement whose barb detaches itself from the handle when the animal is hit and, being attached to a float or drag, prevents the escape of the game. The dog sledge is common everywhere except among the Eskimo of southwestern Greenland. In regions where iron is obtainable from the white men, iron runners are now largely substituted for those of ivory or whale-bone, formerly used. Eskimo dogs are admirably adapted for sledge work.

The dwellings are always of two kinds—tents for summer and houses or huts for winter use. The tents, or tupiks, are made of sealskin; the igloos, or winter houses, are far more varied in structure among the different groups. They are usually built of stones, chinked and covered with moss and banked up with snow. The entrance is a long passage high enough to admit a man crawling upon hands and knees. In some places—e.g., in northern Alaska—huts are half underground. Many of the western and Labrador Eskimo build their houses chiefly of wood. Some of the winter houses of the East Greenland natives shelter 40 to 60 persons. The temporary winter houses, built during journeys, are made of blocks of snow, piled in a shape somewhat like that of a beehive. This is also the permanent winter house of the Central and Banks Land divisions. The dress for men and women consists of boots, trousers, and a jacket with a hood, which can be drawn up to cover the head. Women nursing children carry their infants in hoods. The boots of the women are higher than those of the men, and indeed among the Smith Sound Eskimo extend to the thighs. Except where trade is carried on with the whites, the clothing is entirely of furs and the skins of birds, and may be considered perfect for the conditions under which it is worn.

In the relations between the sexes there is much laxity, but where missionary influences prevail the marital relations are of the conventional civilized type, and the sexual morality of many natives is of a high order. There is much that is admirable in these simple-minded people. They are honorable with regard to

property, children and the aged and infirm are well cared for, and generosity and hospitality are characteristic traits. Most of the products of the hunt are common property. The Eskimo are naturally cheerful, merry, and light-hearted, fond of song and music and with some skill in its production, though among tribes not in close contact with white men the only musical instrument is a kind of small tambourine made of membrane stretched over an oval bone frame. They are friendly to strangers, and warfare is almost unknown among them. Many are adepts in making carvings of walrus ivory, the Alaska natives excelling in the ornamentation and finish of these products. Those natives who are not under missionary influence have the vaguest religious ideas. They believe in invisible powers or demons which rule over the riches of the sea, and a special function of the *angekoks*, or shamans, is to propitiate these mysterious influences.

ESKIMO DOG. See **SLEDGE DOG**.

ESKI-SHEHR, ɛs'kə-shə'h'r. A town and railway junction in the Kutai Sanjak, Brusa, Asiatic Turkey, on the Pursak Su, 164 miles west of Angora by rail (Map: Turkey in Asia, B 2). It is noted for its warm mineral springs and valuable meerschaum mines. It is the ancient Dorylaeum. Pop., 20,000, of which one-third are Christians and the rest Mohammedans.

ESKI-SHEHR. The ancient section of the town of Malatia (q.v.) in Asia Minor.

ESKI-ZAGRA, ɛs'kə zā'grā (Turkish name, meaning *Old Zagra*; Bulg. *Stara-Zagora*). A town of Eastern Rumelia, Bulgaria, capital of the Department of Stara-Zagora, situated at the southern base of the Balkans, 45 miles south of Tirnova (Map: Turkey in Europe, E 3). In the neighborhood are numerous gardens, and rose oil is one of the chief products of the town. There are also a number of mineral springs. Eski-Zagra is advantageously located at the junction of the chief passes in the central Balkan Range. In July, 1877, a battle was fought near Eski-Zagra between the Russians under General Gurko and the Turks under Suleiman Pasha, as a result of which the Russian forces were thrown back. Pop., 1887, 16,039; 1910, 22,003; composed chiefly of Bulgarians, Turks, and Jews.

ESLA. A river of Spain, 150 miles long, rising at the base of the Peña Urbina, one of the highest peaks of the Cantabrian Mountains, and flowing in a general southerly direction through the provinces of León and Zamora to its confluence with the Duero, about 20 miles below the city of Zamora (Map: Spain, C 2).

ESLAVA, ɛ-slā'vā, MIGUEL HILARION (1807-78). A Spanish composer and theorist. He

was born at Burlada, near Pamplona. In 1828 he became maestro in Ossuña Cathedral, where he also took holy orders. In 1832 he was appointed to the same position at Seville, and in 1844 he became court maestro to Queen Isabella at Madrid. His principal works are the three operas *El solitario* (1841), *Las treguas de Tolomaida* (1842), and *Pietro el crudele* (1843); the valuable collections *Museo orgánico español* and *Lira sacro-hispana* (1869); about 150 masses, motets, and psalms, and a brief history of the church music of Spain.

ESLAVA, SEBASTIÁN DE (1714-89). A Spanish soldier, born in Navarra, and one of the cadets with whom the Real Academia Militar of Barcelona was founded. Having served with distinction in the wars of Philip V, he was appointed in 1738 lieutenant general, and in 1740 Viceroy of New Granada (the present Republic of Colombia). He re fortified the fort of Cartagena, which in 1741 he brilliantly defended against a strong English force under Admiral Sir Edward Vernon. He served as Viceroy until 1748. On his return to Spain he was advanced to the grade of captain general and in 1750 was made Governor of Andalusia (a highly coveted post at that time). The same year he was appointed director of the Spanish infantry (a post he held for four years). Then, in 1754, he became Secretary of State for War. On the accession of Charles III to the throne Eslava retired to private life, living in Madrid till his death.

ESMANN, ɛs'mān, GUSTAV (1860-1904). A Danish author and journalist, born and educated at Copenhagen. He studied law, but abandoned it for literature, his first production being the two tales published in the volume *Gammel Gæld* (1885). His plays, which are frequently performed in Denmark, Norway, and Sweden, are superficially effective, but lacking in dramatic characterization. Among them may be mentioned: *I Stiftelsen* (1886); *I Provinsen* (1890); *Den kære Familie* (1892); *Magdalene* (1893); *Den store Maskerade* (1895); *Vandre-falken* (1898); *Det gamle Hjem* (1899); *Alexander den Store* (with Sven Lange); *Sangerinden* (1901).

ESMARCH, ɛs'märk, JOHANNES FRIEDRICH AUGUST VON (1823-1908). A German surgeon, born at Tönning, Schleswig-Holstein. He studied medicine at Kiel and Göttingen, and in the Danish War of 1848 served as lieutenant, as assistant surgeon, as chief physician of the citizens' hospital at Flensburg, and lastly as adjutant of Dr. Stromeyer. He became professor and director of the hospital at Kiel in 1857, and during the Schleswig-Holstein War (1864) he was eminent in hospital work, and during the Franco-German War (1870-71) he was physician general and consulting surgeon to the army. In 1871 he returned to Kiel as professor of surgery. His second wife was the Princess Henriette of Schleswig-Holstein. He was for many years the greatest authority on gunshot wounds. He originated valuable improvements in barrack hospitals, ambulances, etc., and was the inventor of the bloodless method of operating on the extremities, which consists of applying a bandage firmly to the extremity from its distal point upward, thus pressing the blood out of the limb before applying the tourniquet. In this way danger from venous congestion after constricting the limb is avoided. This method was invented by Esmarch independently and in igno-

rance of similar suggestions by Grandesso Silvestri of Vicenza. Among his medical works are: *Ueber Resektionen nach Schusswunden* (1851); *Beiträge zur praktischen Chirurgie* (1853-60); *Ueber chronische Gelenkentzündungen* (1867); *Ueber den Kampf der Humanität gegen die Schrecken des Krieges* (1869; 2d ed., 1899); *Der erste Verband auf dem Schlachtfelde* (3d ed., 1899); *Verbandplatz und Feldlazarett* (1871); *Ueber künstliche Blutcere bei Operationen* (1873); *Handbuch der kriegschirurgischen Technik* (1877 and several subsequent editions); *Die erste Hilfe bei plötzlichen Unglücksfällen: Ein Leitfaden für Samariterschulen* (17th ed., 1901).

ESMARCH, KARL (1824-87). A German jurist, born at Sonderburg and educated at Kiel, Bonn, Heidelberg, and Berlin. In 1855 he became professor of Roman law at Cracow and two years later at Prague, where he remained until his death. Besides a number of epic poems, published under the name Karl von Alsen, he wrote the well-known legal work entitled *Römische Rechtsgeschichte* (2d ed., 1877-80).

ESMENARD, és'ma'nür', JOSEPH ALPHONSE (1769-1811). A French publicist and poet, born at Péligasse (Bouches du Rhône). After traveling extensively he settled in Paris and became coeditor of *La Quotidienne* (1797) and *Le Mercure de France* (1798). During the Consulate he was sent as secretary to the Admiral Villaret-Joyeuse, Governor of Martinique, and afterward was Consul to the island of St. Thomas (1804). A year later he published his poem *La navigation* (1805), which had its inspiration many years before in his early travels in America. He was received into the Academy in 1810 and shortly after incurred the displeasure of Napoleon by a satirical article on Russia in *Le Journal de l'Empire*, for which he was obliged to leave France.

ESMERALDA, és'ma-räl'dä. The sweetheart of Quasimodo, in Victor Hugo's *Notre Dame de Paris*.

ESMERALDAN. A linguistic stock of South American Indians once occupying the entire course of Esmeraldas River in northwestern Ecuador. Consult Rivet, in *L'Année linguistique* (1908-10), and Seler, *Gr. Abh. z. amer. Sprach- u. Altertumsk.*, vol. i, pp. 49-64 (Berlin, 1902).

ESMERALDAS, és'ma-räl'däs. A port of Ecuador and capital of the province of the same name, situated at the mouth of the Esmeraldas River on the Pacific Ocean (Map: Brazil, A 3). The surrounding region produces tagua (see IVORY, VEGETABLE), tobacco, and cacao. The manufacture of cigars is the chief industry. Tagua, rubber, sugar, and cattle are the principal exports. The name was given by the Spaniards from the emeralds discovered in the vicinity. Pop., about 3000.

ESMOND, BEATRIX. A cousin of Henry Esmond, in Thackeray's novel of that name; a beautiful, vain, ambitious woman who also appears in *The Virginians* as Madame de Bernstein.

ESMOND, HENRY V. (1869-1922). An English dramatist and actor, whose real name is Jack, born at Hampton Court, England, and educated by tutors. In 1885 he went on the stage, but after 1896 devoted himself chiefly to writing. His best-known plays are: *One Summer's Day* (1897); *Grierson's Way* (1897); *The Wilderness* (1901); *When we Were Twenty-one* (1901); *The Sentimentalist* (1902); *My Lady*

Virtue (1902); *Billy's Little Love Affair* (1903); *A Young Man's Fancy* (1912). Consult William Winter, *The Wallet of Time* (2 vols., New York, 1913).

ESNAMBUC, és'näs'buk', PIERRE BELAIN D' (1585-1636). A French navigator and founder of the French settlements in the West Indies. He was born at Allouville, and as commander of a vessel in the Caribbean took possession of the island of St. Christopher for the purpose of colonization. A plan suggested by him to the governments of France and England, whereby the island was to be divided between the two countries, was approved, and in 1626 D'Esnambuc transported more than 500 immigrants to the new possession. Between the years 1627 and 1636 he established settlements on Martinique and other islands of the Caribbean. The town and fort of St. Pierre, completely destroyed by a volcanic eruption, May 8, 1902, were founded by him.

ESNE (Egyptian *Snét*, Coptic *Snê*). An Egyptian town on the left bank of the Nile (lat. 25° 15' N., long. 32° 8' E.), about halfway between Erment and El Kab (Map: Egypt, C 2). By the Greeks it was called Latopolis, from the fish latos which was revered there. Esne was a place of considerable importance, especially in Roman times. The temple, dedicated to the god Knum, was probably built under the Ptolemies on the site of an older structure. The great portico of 24 columns contains many inscriptions of Roman emperors. One of these bears the name of Decius (250 A.D.) in hieroglyphics. Near Esne is the ancient convent of Ammonius, said to have been founded by the Empress Helena in honor of the martyrs who perished here in the persecution under Diocletian. Near here Coptic buildings have been discovered. Consult: Champollion, *Notices descriptives* (Paris, 1844); Mariette, *Monuments of Upper Egypt* (London, 1877); Lane-Poole, *Egypt* (ib., 1881).

ESOP. See ESOP.

ESOPHAGUS. See OESOPHAGUS.

ESOPUS WAR. An intermittent conflict between the Indians and the Dutch settlers at Esopus (now Kingston) in Ulster Co., N. Y., which began in the summer of 1658. Some Indians employed as field hands by the Dutch, while drunk and boisterous, were fired upon by the farmers. This gave rise to a series of bloody reprisals on the part of the savages, the most serious of which was the destruction of the village of Wiltwyck (the Dutch equivalent for the Indian Esopus), when 40 women and children were carried off as prisoners and 21 men were killed. Governor Stuyvesant of New Netherland, in retaliation, immediately sent up a force which punished the Indians. In May, 1664, a treaty of friendship was concluded.

ESOTERIC (Gk. *ἐσωτερικός*, *esōterikos*, inner, from *ἔσω*, *esō*, within). A word used at first by the ancient Greeks of those initiated into the Mysteries, but later applied in ancient as in modern times to mark a distinction supposed to exist between certain classes of the writings or discourses of Aristotle (q.v.). The esoteric works, designed for the disciples, were thought to be less popular, either in style or in treatment, and to contain more technical doctrines, than the exoteric works, which were designed for the public. The word *esoteric* is not used by Aristotle himself, and it is doubtful if his use of the word *esoteric* implies this distinc-

tion; he may be referring merely to "popular treatises." Grote understands the word *exoteric*, as used by Aristotle, to refer to the *dialectic* method, as opposed to the *nonexoteric* (*esoteric*), or *didactic*, method. The term was also applied to the special teachings of Pythagoras. Consult Christ-Schmid, *Geschichte der Griechischen Literatur*, i, 673 (5th ed., Munich, 1908).

ESPALIER, ɛs-pāl'yēr (Fr., fruit wall, It., *spalliera*, from Lat. *spatula*, broad piece, blade). A system of training fruit trees or vines on a wall. The trees are generally grown as cordons (q.v.). The branches are fastened to a trellis which is supported by the wall. Trees which are trained on a trellis opposite an espalier, usually with a path between, are called *contraespaliers*.

ESPALIER PLANT. A plant which cannot grow erect without outside mechanical support; hence a prostrate or procumbent plant. See STEM.

ESPARSETTE. See SAINTFOIN.

ESPARTERO, ɛ'spār-tà'rò, BALDOMERO (1792-1879). A Spanish general and statesman. He was born Feb. 27, 1792, at Granátula in La Mancha and was educated at the University of Almagro. Upon the outbreak of the war against Napoleon he joined the patriot forces and fought until 1814, going the next year to South America. There he served with the Spanish forces throughout the War of Liberation waged by the South American colonies. He returned in 1824 to Spain and took a prominent part in the civil conflicts which followed the death of Ferdinand VII and the accession of Isabella II. He rose to be lieutenant general, and twice, as commander in chief, saved Madrid from the Carlist forces—once in August, 1836, and again in September, 1837. In 1836, too, he twice forced the Carlists to raise the siege of Bilbao. In 1839, by making with Maroto the famous convenio de Vergara (whereby the titles and ranks for nearly 1000 Carlist officers were recognized), he practically ended the war and drove Don Carlos from Spain—a service for which he was made Duke of Victoria and Duke of Morella and grandee of Spain, after having been created Count of Luchana for his bravery at Bilbao and Luchana. He now became practically military dictator of Spain, allied with the Progressist party, and in 1841, after the Queen Mother Maria Christina was forced to resign the regency, he was appointed by the Cortes in her place. His government was marked by energy and ability; but in 1843 a combination of parties naturally inimical to each other, the Republicans and Moderates, overthrew his government and drove him into exile. He spent four years in England and in 1848 returned to Spain, living quietly at Logroño till 1854, when an insurrection of the people compelled the Queen Mother to leave the kingdom. Espartero, supported by the Progressists, and General O'Donnell, supported by the Conservatives, now conducted a coalition government for two years; but the Progressists lost their hold in that time, and Espartero gave way (July, 1856) to O'Donnell. After 1856 Espartero refused to be active in politics, and in 1857 he resigned his dignity as senator. After the revolution of 1868, which resulted in the expulsion of Queen Isabella, he gave his full adhesion to the provisional government, though he took no part in its proceedings. In 1870 he declined to become a candidate for the throne of Spain. King Amadeo

made him Prince of Vergara. In 1875 he adhered to King Alfonso. Consult Florez, *Espartero, Historia de su vida militar y política* (Madrid, 1843-44), and Mariana, *La regencia de Baldomero Espartero* (ib., 1870). See SPAIN.

ESPARTO. A grass (*Stipa tenacissima*) extensively employed in the manufacture of paper in Great Britain. Esparto is grown in northern Africa, Spain, and adjacent countries, from whence it is shipped for paper stock. A part of the esparto paper stock is derived from *Lygeum spartum*, a grass of the Mediterranean region.

ES'PER, EUGEN JOHANN CHRISTOPH (1742-1810). A German naturalist, born at Wunsiedel. He was appointed professor of natural history at Erlangen in 1782 and director of the cabinet of natural history there in 1805. His works on butterflies, *Die europäischen Schmetterlinge* (new ed., 1829-39) and *Die ausländischen Schmetterlinge* (new ed., 1830) are notable.

ESPERANTO, ɛ'spá-rán'tò. The most popular among the proposed auxiliary international languages. It has been indorsed by such men as Berthelot in France, Sir William Ramsey in England, Ostwald in Germany, and the philologist Schuchardt in Austria. It has been introduced in many schools as a free elective, and the Chamber of Commerce in London has put it on its list of examinations for candidates wishing to apply for positions. It was invented by a Russian physician, Zamenhof, whose first publication on the subject, in 1887, was signed "Dr. Esperanto" (Hopeful). The directing principle is to make use of everything that is common to the civilized languages and drop what is special to any one of them. In pronunciation, the English *io* and *th*, the French *u*, the Spanish *j* and *ñ*, are dropped; different sounds represented by the same letter are distinguished, e.g., *g* is always guttural (*good*), while *ĝ* is used in words like *gem*; and so for other letters; thus, the strict phonetic spelling is possible: one sound, one letter. The principle of internationalism is specially obvious in the vocabulary: words common to all civilized languages are chosen first; then those common to all but one language are adopted; then in all but two, and so forth. But when there is no one international word, a selection is usually made, though somewhat at random, between Romance and German words. It may be noted that Slavic roots are less numerous than those of the above languages. A system of about 30 prefixes and suffixes, also borrowed from living languages, renders easy the task of memorizing. Instead of having one word for *good* and one for *bad*, Esperanto says *good* and *not-good* (*bona*, *malbona*), which is not always true; the infix *in* marks the feminine: *patro*, father, *patrino*, mother; this principle applies in nouns, adjectives, adverbs, verbs, etc. Again, instead of two words like *cut* and *knife*, Esperanto will say *cut* and *cutter* (*tranĉi*, *tranĉilo*). The grammar has 16 rules without exceptions. The ending *o* always represents a noun, *a* an adjective, *e* an adverb, *j* the plural, *i* the infinitive of a verb, *as* the present tense, *is* the past, *os* the future, *u* the imperative, *us* the conditional, etc. Possessive adjectives are formed by adding the adjectival *a* to the personal pronouns, *mi*, I, *mia*, my; the same for ordinal adjectives, *tri*, three, *tria*, third. For interrogation *ĉu* is placed before an affirmation.

The adaptability and flexibility of Esperanto

have been illustrated by translations of scientific, philosophical, and literary works. There are Esperanto clubs in nearly all large cities. Consult O'Connor, *Esperanto Complete Text-Book* (New York). Following is a specimen of Esperanto, with the English translation:

Esperanto Text: Simpla, fleksebla, belsona, vera internacia en siaj elementoj, la lingvo Esperanto prezentas al la mondo civilizita la solan veran solvon de lingvo internacia; car, tre facile por homoj nemulte instruoj, Esperanto estas komprenata sen peno de la personoj bone edukitaj.

"Simple, flexible, well sounding, truly international in its elements, the language Esperanto presents to the civilized world the only true solution of the international language; for, very easy for people not much learned, Esperanto is understood without trouble by well-educated people."

There is little doubt that the present spread of Esperanto would have been much greater, had it not been for the creation of new letters by its author. This is the first international language to make such an attempt, with the result that many sympathetic newspapers and other publications, not possessing the special characters like ĉ, ĝ, ĥ, ĵ, ŝ, and ŭ, did not find it possible to print without great difficulty extracts and articles in Esperanto. Besides philologists, whose objections to an international language are more or less well-known, others have found fault with many of the essential principles of the language. Thus, the principle of internationality of roots is not strictly followed; the accusative case is considered by some unnecessary; while speakers of the Romance languages object to the use of -a to indicate adjectives and -o to indicate nouns, as confusing to them. Many also object to the use of the feminine form of the definite article (*la*) of the Romance languages instead of the simpler English *the*. While the verb is in general good, there is no doubt that the noun could be improved upon. The Germanic words, which are usually poorly selected, could either be omitted or reduced to the common Germanic form. Finally, the mixture of languages, it is maintained, renders it difficult for one to acquire the vocabulary.

But in spite of these objections and many others that could be adduced, Esperanto has well served its purpose. Even if it is doomed to die, as many believe, it has shown the possibility and the necessity of a means of international communication if for no other means than those of business. Excess of enthusiasm, such as the translation of Shakespeare into Esperanto, has often provoked the gibes of the opposition. Of the many publications issued during recent years which treat of Esperanto, it will suffice to note the following: Ivy Kellerman, *A Complete Grammar of Esperanto* (New York, 1910); Bullen, *Lessons in Esperanto* (ib., 1908); Rhodes, *English-Esperanto Dictionary* (ib., 1908), which is based upon the *Fundamento* of Dr. Zamenhof, as well as the literature in Esperanto and the national Esperanto dictionaries bearing the "aprobo" of Zamenhof; Zamenhof, *Die Weltsprache "Esperanto"; vollständiges Lehrbuch*, trans. into German by Trompeter (Nuremberg, 1891); id., *Wörterbuch der internationalen Esperanto-Sprache* (ib., 1891); Méray, *La langue internationale auxiliaire "Esperanto" et la littérature scientifique* (Paris, 1902); Brugmann and

Leskien, *Zur Kritik der künstlichen Weltsprachen* (2d ed., Strassburg, 1907); Underhill, *Esperanto and its Availability for Scientific Writings* (Denver, 1908); and the periodical *The British Esperantist*. See INTERNATIONAL LANGUAGE.

ESPERSON, a'spâr-sôn', PIETRO (1833-). An Italian jurist, born at Sassari, Sardinia. He studied at the university there, and was instructor in law in the university from 1860 to 1865. In the latter year he was appointed professor of international law at the University of Pavia. His works include: *Rapporti giuridici tra i belligeranti e i neutrali* (1865); *La questione Anglo-Americana del "Alabama," discussa secondo i principii del diritto internazionale* (1869); *Giurisdizione internazionale marittima* (1877); *L'Angleterre et les capitulations dans l'île de Chypre au point de vue du droit international* (1879); *Le legge sulla naturalizzazione in Italia* (1880); *De' dritti di autore sulle opera dell'ingegno ne' rapporti internazionali* (1899).

ESPINAL'. A town of Colombia, in the Department of Tolima, 70 miles southwest of Bogotá. It has tobacco and pottery industries. Pop., 10,000.

ESPINAL (Sp., thorny), or **CHANAR**. See THICKET.

ESPINAS, a'spé'ná', VICTOR ALFRED (1844-1922). A French philosopher and sociologist, born at Saint-Florentin. In 1893 he became professor of social economy at the Sorbonne, Paris, and in 1904 professor of the history of the doctrines of economics. He wrote: *Les sociétés animales* (1877); *Histoire des doctrines économiques* (1893); *La philosophie sociale du XVIIIème siècle et la Révolution* (1898); *La troisième phase et la dissolution du mercantilisme* (1902). He translated, with Th. Ribot, Spencer's *Principles of Psychology* (1874).

ESPINASSE, a'spé'nás'. See L'ESPINASSE.

ESPINASSE, ESPRIT CHARLES MARIE (1815-59). A French general, born at Castelnaudary. He was made a general and aid-de-camp to Louis Napoleon after the coup d'état of Dec. 2, 1851, in recognition of his service in invading the National Assembly at night and seizing the quæstors. During the Crimean War he fought at the taking of the Malakoff. As Minister of the Interior from February to June, 1858, he presented to the French Legislature the famous *Loi de sûreté générale*. He then became senator. He was killed at Magenta.

ESPINEL, a'spé'nál', VICENTE MARTÍNEZ (1551-1624). A Spanish poet, novelist, and musician, born at Ronda, Andalusia. After studying at the University of Salamanca, from which he was expelled in 1572, he served as a soldier in Italy and Flanders and upon his return to Spain, about 1584, prepared to enter the church, taking orders in 1587 and becoming chaplain of Ronda in 1591. For absenting himself from his living without permission he lost his cure. Later he was made choirmaster of Plasencia. He revived a form of poetry known as *décimas*—stanzas of 10 octosyllabic verses—which came thereafter to be called *espinelas*. He was credited by his contemporaries (*inter alios* Lope de Vega) with having added a fifth string to the guitar. This is now disputed on evidence tending to prove that at earlier dates there were guitars with five, and even with six, strings. His most important work is a romance, *Relaciones de la vida del escudero Marcos de Obregón* (1618), which is largely an auto-

biography with embellishments. For many years Lesage was accused of having ruthlessly pillaged *Marcos de Obregón* for his *Gil Blas*. The matter has been thoroughly cleared up, and it is shown that Lesage's total borrowings from French and Italian sources, as well as from this and other Spanish sources, represent only about one-fifth of the bulk of *Gil Blas*. Espinel also wrote a translation of Horace and lyrical poems, *Diversas rimas de Vicente Espinel* (1591). He left in manuscript many poems which have remained inedited because of their licentiousness. Consult Pedro Salvá y Mallén, *Catálogo de la biblioteca de Salvá* (Valencia, 1872), for some previously unpublished poems. Consult also J. Pérez de Guzmán's edition of *Marcos de Obregón* (Barcelona, 1881) with introduction, and Leo Claretie, *Lesage romancier* (Paris, 1890).

ESPINOSA, á-spé-nó'sú, GASPAB DE (?1484-1537). A Spanish lawyer and soldier, born at Medina del Campo. In 1514 he accompanied Pedrarias Dávila to America and became chief justice of the colony at Darien. He was judge of the tribunal which condemned to death Balboa, Dávila's predecessor as Governor, but refused to pass sentence upon the famous explorer until ordered to do so by the Governor. He abandoned his judicial position and was the leader of several expeditions against the Indians, whom he treated with great cruelty. In 1518 he founded Panama and several years later returned to Spain, where he was rewarded by the Emperor Charles V and was appointed a crown officer in Santo Domingo. He returned to Panama, and when Pizarro fitted out his second Peruvian expedition became one of his financial backers. He tried also to bring about an understanding between Almagro and Pizarro, but died in Cuzco without fulfilling his desire.

ESPIRITO SANTO, á-spé-ré-tu sin'tu (Portug.). A maritime state of Brazil, bounded by the state of Bahia on the north, the Atlantic Ocean on the east, the state of Rio de Janeiro on the south, and Minas Geraes on the west (Map: Brazil, N., J 7). Its area is 17,310 square miles. The Sierra dos Aimorés marks the western border. The coast is generally swampy, but to the south there are precipitous cliffs. The interior is generally mountainous, with elevations reaching 7000 feet. The main river is the navigable Rio Doce, which divides the state into two equal parts. All the streams are well supplied with fish. There is but one good harbor, that of Espirito Santo. The tropical climate is tempered by the proximity of the sea, the mountains, and the extensive forests.

The soil is very fertile. Sugar cane and coffee are chiefly grown, cotton and rice receiving some attention. There is one cotton mill in the state. The principal export is coffee, which is all shipped from Victoria (q.v.), the capital and practically the only port. The forests furnish costly woods and rare drugs. There are wild stretches of land, lying for the most part in the north, little explored as yet, and inhabited by Indians. Fishing is a leading occupation. Deposits of marble and lime have been found, but there is no mining. Stock raising is neglected. Espirito Santo has four representatives in the national Chamber of Deputies. There are in the state about 50 miles of railway.

Pop., 1890, 135,997; 1900, 209,783; 1913, 430,000. There are several German settlements. Though the state is liberal in its supply of funds for public schools, the percentage of chil-

dren receiving instruction is low, and the inhabitants have little education. The shores of Espirito Santo were first visited by the Portuguese in 1535.

ESPOUS'AL (OF. *espousailles*, Fr. *épousailles*, from Lat. *sponsalia*, betrothal, pl. of *sponsalis*, bridal, from *sponsa*, bride, from *spondere*, to pledge). A ceremony of betrothal preparatory to marriage. 1. Among the Jews the first advances suggesting betrothal or engagement were generally on the part of the young man's parents (Gen. xxxiv. 6, 24); sometimes, however, the young man himself suggested the union (Judg. xiv. 2). The proposition was accompanied by the giving of gifts, and, when both parties agreed, the groom's parents gave a dowry to the bride's family. Originally this was the property of the family, but later it became the property of the bride to provide for her future in case of forced divorce or the death of her husband. From the time of betrothal any breach of chastity on the part of the bride meant death, and in general the same rules applied as if the marriage had already been celebrated. There was no definite period after betrothal when the marriage took place. In later times the right of choosing was given to the individuals concerned in the marriage, but even then the form of betrothal was still binding. 2. In the early Christian Church also a ceremony of espousal preceded marriage. The preliminaries consisted in a mutual agreement between the parties that the marriage should take place within a limited time, confirmed by certain donations as the earnest of marriage, and attested by a sufficient number of witnesses. The free consent of parties contracting marriage was required by the old Roman law and by the Code of Justinian. The gifts bestowed were publicly recorded. The dowry settled on the bride was stipulated in public instruments under hand and seal. The ring was given at the betrothal rather than at the actual marriage. The use of the marriage ring dates from very early times, and its recognized place was then as now on the woman's fourth finger. The witnesses present, friends of both parties, were usually 10 in number. The espousal, as incorporated with the wedding rite, is plainly traceable in the usage of the Roman, Anglican, and other churches of the present day. Consult Mielziner, *The Jewish Law of Marriage and Divorce* (Cincinnati, 1884).

ESPRIT DES LOIS, á'spré' dá lwá. See MONTESQUIEU.

ESPRITS FORTS, á'spré' fôr (Fr., bold spirits). The name assumed by the French school of writers termed freethinkers (q.v.) in England and including Voltaire, Diderot, Helvétius, D'Alembert, and their contemporaries. While the English freethinkers aimed at securing merely freedom of religious speculation, and did not seek the violent substitution of a system based upon their own views for the existing order, the French *esprits forts* held a distinctly aggressive position outside of all religious confessions, vigorously opposed the despotism of church as well as of state, and were propagandists of the most radical sort. Skeptical of the value of human feeling as a guide, they desired the authority of pure reason alone to be recognized and the supremacy of the intellect to be everywhere acknowledged. Their influence was extensively felt, and many of the doctrines which they inculcated bore both good and evil fruit in the following century.

ESPRONCEDA Y LARA, ás'prón-thá'dá & lá'rã, JOSÉ IGNACIO JAVIER ORIOL ENCARNA-CIÓN DE (1808-42). A Spanish poet, born at, or near, Almendralejo, Estremadura. At 14, Espronceda was already noted for his verses and had joined a secret society; and shortly thereafter he was sent to the Franciscan convent at Guadalajara for five years of seclusion as a revolutionist. He fought in Paris in the revolution of 1830 and afterward in the struggle for Polish liberty. Taking advantage of the amnesty of 1833, he returned to Spain, obtained a commission in the Queen's Guards, was sent to The Hague in 1840 as Secretary of Legation, and in 1842 was elected deputy from Almería; but he was frequently in political and official disfavor, for his republican spirit kept him involved in plots, only ceasing with his early death. Espronceda is called the Spanish Byron, and he has also been compared to Victor Hugo, but has neither his force nor originality. He stood for the ardent, eager, revolutionary young Spain of his day, and his odes reflect that spirit. No lyric poet of his country has surpassed him in these. While in seclusion at Guadalajara, he began his epic poem *El Pelayo*. Later he wrote a part of another narrative poem, *El diablo mundo* (1841), dealing with the Faust legend; a novel, *Don Sancho Saldaña* (1834); and a fantastic romance, *El estudiante de Salamanca*, a variation of the Don Juan legend. A complete edition of his works, *Obras poéticas y escritos en prosa*, was prepared in 1884 by his daughter, Doña Blanca de Espronceda de Esco-sura, with much material hitherto unedited. The second volume has not been published. Consult also: E. Rodríguez Solís, *Espronceda: su tiempo, su vida, y sus obras* (Madrid, 1883); the excellent works by Philip H. Churchman, "Espronceda's Blanca de Borbón" and "More Inedita," in the *Revue Hispanique*, vol. xvii, pp. 549-777 (1907), "An Espronceda Bibliography," in the *Revue Hispanique*, vol. xviii, pp. 741-773 (1907), and "Byron and Espronceda," in the *Revue Hispanique*, vol. xx, pp. 1-210 (1909); A. Bonilla y San Martín, "El Pensamiento de Espronceda," in the *España Moderna*, vol. cccxiv, pp. 69-101 (1908); J. Fitzmaurice-Kelly, in the *Modern Language Review*, vol. iv, pp. 20-39 (1908); J. Cascales y Múñoz, "Apuntes y materiales para la biografía de Espronceda," in the *Revue Hispanique*, vol. xxiii, pp. 1-108 (1910).

ESPY, JAMES POLLARD (1785-1860). An American meteorologist, the founder of modern physical or theoretical meteorology. He was born in Westmoreland Co., Pa., graduated in 1808 at the Transylvania University, Lexington, Ky., studied law at Xenia, Ohio, and was principal of the academy at Cumberland, Md., from 1812 to 1817. He then became professor of languages in the classical department of the Franklin Institute of Philadelphia, where he remained until about 1853, when he resigned in order to devote himself wholly to meteorological lectures and investigations. His memoir of 1836 on the theory of storms gained for him the Magellanic prize. In 1840 he visited England and France and discussed his theories in person before the British Association and the French Academy of Sciences. Espy's convection theory was based on sound physical principles, but his ideas on the mechanics of storms are not borne out by observed facts. Redfield supported the now generally accepted rotary theory of the

mechanism sometimes set in action by convection. In 1841 Espy returned and published his *Philosophy of Storms*. In 1842 the United States Congress appointed him meteorologist to the War Department, where he established a service of daily weather observations, compiled daily weather maps, traced the progress and development of storms, and submitted, in October, 1843, a first annual report containing a great body of facts. He was subsequently appointed meteorologist to the Navy Department. In 1852 he was ordered by Congress to continue his researches in connection with the Smithsonian Institution, which had already undertaken the collection of meteorological data. To Espy are due the stimulus and the knowledge that made the present United States Weather Bureau a possibility. An appreciative sketch will be found in *Appleton's Popular Science Monthly* for April, 1889. Consult also *Monthly Weather Review*, vol. xxxv (Washington, 1907).

ESQUILACHE, á'ské-lá'chá, DON FRANCISCO DE BORJA Y ARAGÓN, PRÍNCIPE DE (c.1581-1658); known also as FRANCISCO DE BORJA Y ACEVEDO. A Spanish poet, born in Madrid. He was Viceroy of Peru from 1614 until 1621, and the remainder of his life was spent at the court of Madrid. He is the author of the sacred poem *La pasión de Nuestro Señor* (1638); an epic poem in honor of the conquest of Naples, *Nápoles recuperada* (Saragossa, 1651); and a translation of Thomas à Kempis (Brussels, 1661). Several editions of his poems have been published under the title *Obras en verso* (1639-48, 1654-63). Selections of his works are to be found in the *Biblioteca de Autores Españoles*, vols. xvi, xxix, xlii, and lxi.

ESQUILINE HILL (Lat. *Esquilinus Mons*). The highest of the seven hills of Rome (246 feet), standing between the Viminal and the Caelian and east of the Palatine. It has two spurs, Mons Oppius and Mons Cispius, on the former of which stands the church of San Pietro in Vincoli, on the latter Santa Maria Maggiore. Its unsanitary condition in early times was remedied under Augustus by Mæcenas, who buried a whole section under a layer of fresh earth 25 feet deep and laid out on it the pleasure grounds known as the Gardens of Mæcenas (q.v.). The Esquiline under the Empire became a fashionable residence section. On it stood the houses of Vergil, Horace, Mæcenas, and Propertius, and also the baths of Titus. Nero's Golden House covered much of the Esquiline. Many ruins of ancient edifices have been uncovered, but at once destroyed, in the course of modern building operations, and the district now forms an entirely new quarter of the city. Consult Platner, *The Topography and Monuments of Ancient Rome* (2d ed., New York, 1911).

ESQUILINUS MONS. See ESQUILINE HILL.

ESQUIMALT, és-kwí'mált. A naval and military station near Victoria, B. C., Canada, on Vancouver Island and the Strait of San Juan de Fuca (Map: British Columbia, D 5), and on the Esquimalt and Nanaimo Railway. The industries include a salmon cannery, shipbuilding, a limekiln, oyster beds, a barrel factory, and a tile and sewer-pipe factory. Esquimalt has an excellent harbor and was for a time the headquarters of the British Pacific squadron; it also has a navy yard, graving dock, barracks, arsenal, meteorological station, and hospital. It is connected with Victoria by an electric railway. It has strong fortifications, manned by Canadian

troops, the British garrison having been withdrawn in 1906. In 1910 the dry dock was transferred by the British Admiralty to the Canadian government. Four warships were stationed here, also a school of coast-defense artillery. Pop., 1914, about 250, exclusive of military and naval forces.

ESQUIMAUX. See **ESKIMO**.

ESQUIRE (OF. *escuyer*, Sp. *scudero*, It. *scudiero*, ML. *scutarius*, shield bearer, from Lat. *scutum*, shield). In chivalry, the shield bearer or armor bearer of the knight to whom he was an apprentice while learning the use of arms. (See **CHIVALRY**.) The title is at present given, in England and in some parts of the United States, to all persons supposed to be in easy circumstances, excluding manual laborers and small shopkeepers. Although the title of esquire is now used with little discrimination, the following seem to be those whose claim to it stands on the ground either of legal right or of long-established courtesy: esquires by birth—(1) all the untitled sons of noblemen; (2) the eldest sons of knights and baronets; (3) the sons of the younger sons of dukes and marquises, and their eldest sons. There are also esquires by profession, whose rank does not descend to their children; and esquires by office, e.g., justices of the peace, who enjoy the title only during their tenure of office. The creation of esquires by letters patent or investiture long ago ceased.

ESQUIROL, à'skè'ròl', JEAN ETIENNE DOMINIQUE (1772-1840). A celebrated French alienist, born at Toulouse. He served in the military lazaretto at Narbonne in 1794, obtained his degree of M.D. in 1805, and was appointed physician to the Salpêtrière at Paris in 1811. After 1817 he delivered clinical lectures on the diseases affecting the mind and their cures; in 1818 he secured the appointment of a commission, of which he became a member, for the remedy of abuses in insane asylums; in 1823 he became inspector general of the University, and in 1825 first physician to the Maison des Aliénés. He was at the same time principal physician of the private insane asylum at Charenton, which he had organized. During the July revolution he lost all his public offices and withdrew into private life. By his humane treatment of the insane he often effected cures. His writings embrace all the questions connected with the treatment of insanity. Esquirol paid great attention to the construction of suitable buildings for the insane; and most of the modern insane asylums in France, such as those of Rouen and Montpellier, have been built according to his directions. His most important works are *Des illusions chez les aliénés* (1832; Eng. trans. by Liddell, 1833) and *Des maladies mentales considérées sous les rapports médical, hygiénique, et médico-légal* (1838).

ESQUIROS, à'skè'ròs', ALPHONSE HENRI (1812-76). A French poet, romancer, radical politician, and anti-Catholic agitator, born in Paris. He was imprisoned and confined for his *Evangile du peuple* (1840) and exiled for his political activity after Napoleon's coup d'état (1851). He was one of the few legislators who dared to vote against the war with Germany (1870). He held office under the Government of National Defense (1870), was suspended by Gambetta, elected deputy in 1871, and senator in 1876, as *démocrate-socialiste*. His political works are: *Paris, ou les sciences, les institu-*

tions, et les mœurs au XIXe siècle (1847); *Histoire des Montagnards* (1847); *L'Angleterre et la vie anglaise* (1859-70); *La Néerlande et la vie hollandaise* (1859). In English he published *Religious Life in England* (1867). His poetry appeared under the titles *Les hirondelles* (1834); *Chants d'un prisonnier* (1841). To fiction he contributed *Le magicien* (1837) and *Charlotte Corday* (1840). Socialistically ethical are *La vie future au point de vue socialiste* (1857) and *La morale universelle* (1859).

ESQUIVEL, à'skè-vèl', JUAN DE (c.1470-c.1510). A Spanish soldier. In 1502 he accompanied the expedition of Ovando, who was appointed to succeed Bobadilla as Governor of Hispaniola. He was sent by Ovando in 1504 to subjugate the Indians of the Province of Higüey, then led in revolt by the cacique Cotabanamá. In 1509 he was dispatched by Diego Columbus to conquer the island of Jamaica and establish a colony there. He soon accomplished the subjugation of the Indians and founded the town of Sevilla Nueva. During his few years of rule the colony, through his wisdom and moderation, attained to great prosperity.

ESS, ès, VAN. The name of two Benedictine monks, cousins, distinguished as Roman Catholics of the Liberal school.—The elder, **KARL VAN ESS** (1770-1824), was born at Warburg, Westphalia, Sept. 25, 1770. He entered the Benedictine monastery of Huysburg, near Halberstadt, in 1788, became prior of the cloister in 1801, and episcopal commissary in 1811. He died Oct. 22, 1824. With his cousin he prepared a German translation of the Bible and made a revision of the Osnabrück song book. He advocated the use of the German language in the liturgy.—**JOHANN HEINRICH VAN ESS**, better known by his romantic name of **LEANDER** (1772-1847), was born at Warburg, Feb. 15, 1772. He was educated at the Dominican gymnasium of Warburg, and joined the Benedictine monastery of Marienmünster at Paderborn in 1790. He was ordained priest in 1796, was pastor at Schwabenburg till 1812, and professor of theology in the Marburg Seminary until 1822. He then retired to private life and devoted himself to the translation of the Bible and the circulation of the Scriptures in the vernacular. His work was disapproved by the Catholic authorities, and he defended himself in several publications. He was for a time connected with the Catholic Bible Society of Regensburg, then was agent of the British Bible Society. In 1807 he published a German translation of the New Testament, the circulation of which was forbidden by the Pope. It is the version now circulated by the Württemberg Bible Society among Roman Catholics. His translation of the entire Bible was completed in 1840. He also prepared editions of the Septuagint and the Vulgate and the Greek New Testament. He died at Affolderbach, in the Odenwald, Oct. 13, 1847. Van Ess possessed a valuable library, which was purchased after his death for the Union Theological Seminary of New York.

ESSAAD EFFENDI, ès'siud èf-fèn'dè, **MOHAMMED** (1790-1848). A Turkish historian, born in Constantinople in 1790. He was surnamed *Sahaf-Zadeh*, 'son of the bookbinder,' from his father's occupation. He was historiographer of the Ottoman Empire, superintendent of the official journal of the Empire, and Ambassador to Persia. A portion of one of his works has been translated into French and edited by Caussin de

Perceval under the title *Précis historique de la destruction du corps des Janissaires* (Paris, 1833).

ESSAD TOPTANI, *ës'sád tóp-tá'né*, PASHA (c.1863-1920). An Albanian soldier and national leader, a member of the Toptani family of Tirana, near Durazzo. He was trained for the army, served in the garrisons of Macedonia and Anatolia, and finally commanded the gendarmerie at Constantinople. For his services in the war against Greece in 1897 he was granted the title of Pasha. Although he killed the agent who had been directed by Sultan Abdul Hamid to murder his brother, Ghani Toptani, his influence was so great that Abdul Hamid dared not punish him. Instead, he was transferred to Janina, where he commanded the local gendarmerie and was even raised to the rank of general. Out of hatred for Abdul Hamid, Essad joined the Young Turk movement in 1908, marched with the Saloniki troops to vindicate the constitution, and was head of the deputation that bore the news of his deposition to Abdul Hamid. During the Balkan War, Essad participated in the defense of Scutari against the Montenegrins in 1912; and when the Powers declared in favor of the autonomy of Albania, he raised the Albanian flag over his troops. Shortly after this incident the Turkish commander, Hassan Riza Pasha, was murdered, thus leaving Essad in full command at Scutari. In 1913 he was a member of the provisional Albanian government, and in 1914 he was appointed Minister of War and of the Interior. While on a visit to Italy and Austria in 1914, he was honored with the cross of the Order of the Crown of Italy and the grand cross of the Order of Francis Joseph.

ESSAY. Unlike other literary forms, as the epic, the novel, and the drama, the essay was the invention of an individual, not the climax of a long process of growth and development. It sprang complete from the pen of Montaigne in the sixteenth century; and Montaigne still remains the most illustrious of essayists. Passages in classical literature may be cited which bear a certain relation to this form, and Bacon called the epistles of Seneca "essays," but none of these writings were in any real sense related ancestrally to the modern essay. As contrasted, e.g., with the novel, the essay according to Montaigne is brief and structurally free in form or formless. The name originally chosen for it suggests certain characteristics which distinguish it now as clearly as they did in the day of its origin. As the word "essay"—from the French *essai*, experiment; the Latin, *exagium*, a weighing, from *exigere*, to examine—indicates, this form was a new literary experiment; it approached its theme tentatively rather than in the manner of sustained argument and final exposition; it was a sally into, rather than a complete conquest of, the chosen subject. In Montaigne's hands it was chatty, informal, intimately personal, rambling, familiar, presupposing a single friendly listener. It was, too, the flower of ripe culture and experience; it left behind it a sense of overflow, as from deep springs of humane wisdom. Such was the familiar essay as practiced by Montaigne, and such substantially, in both form and manner, it remains to-day, at least in one of its two developments.

France was late in producing successors to Montaigne. The second practitioner of this literary form was an Englishman, Francis

Bacon, after Montaigne perhaps the greatest of essayists. His essays first appeared in 1597, 17 years after the appearance of the *Essais* of the great Frenchman. In Bacon the characteristics of the new literary genre are substantially the same as in Montaigne; his essays are brief and formless and informal—pithy jottings drawn about a topic as steel fragments about a magnet; without unity, the end forgetting the beginning; confidential and intimate, though with a grave confidence and a stately intimacy; suggestive beyond anything in modern literature, yet without pretext of organic structure or the orderly conduct of thought to a logical conclusion. If Bacon's essays lack the grace, abandon, flow, and perfect ease of their predecessors, they still conform essentially to the Montaigne type.

After Bacon the seventeenth century saw little or nothing of the true essay. The form was often approached, though rarely achieved, in tracts, news-letters, pamphlets, and the like. In 1600, however, William Cornwallis published papers which, however negligible from the literary point of view, were still in kind essays, and in 1668 Abraham Cowley, beloved of Charles Lamb, put forth *Several Discourses by Way of Essays* which are truly akin to the essays of Montaigne. In the year just named also appeared Dryden's *Essay on Dramatic Poesy*, which, in dialogue though it be, may be taken as typical of a kind of writing different enough from the essays of the first French and English practitioners of the art, and yet retaining traits in common with them. Dryden's *Essay* is longer than the pioneers in this genre were wont to make theirs. In place of formlessness there is careful and logical structure, while the confidential manner that engaged, flattered, and held the attention of the reader gives place to the literary tone and deportment proper to an academic forum. On the other hand, Dryden's *Essay* is brief as compared with dissertation or treatise; it absolves itself from the duty of full and exhaustive demonstration; and, however carefully and logically composed, it insists upon maintaining a modest, unpretentious, and tentative air. Thus, early in its history, the word "essay" was accepted—and still is—as referring ambiguously and indifferently either to the familiar essay as practiced by Montaigne and those in his tradition—the brief, formless, personal, intimate essay; or to the longer, more logical, less personal, and more formal type, of which Dryden's *Essay on Dramatic Poesy* is representative. After Dryden there is little to detain the student of the essay until he reaches the opening years of the eighteenth century, a period voluminous in this kind of literature. In the first decade of that century Addison and Steele began to offer a world that has never yet tired of them their delightful papers, ingratiatingly confidential, familiar but well bred, and full of pleasantness and humor. In this light, debonair, and graceful form the essays of the *Tatler* and the *Spectator* gathered up the floating talk and gossip of society, the clubs, and the coffeehouses; moralized the material; and offered it again to the public fresher and more entertaining than at first, and a most wholesome and grateful literary diet for the classes to whom it appealed. Of the unnumbered essays of the time—some 200 periodicals chiefly composed of essays are said to have sprung up—comparatively few survived. Conspicuous among these are many essays of Swift, which live with a

vitality that time will hardly sap, and are published afresh for each succeeding generation. After the *Tailor* and the *Spectator*, however, the essay tended to become heavily moral and dully didactic. But the second half of the eighteenth century was to introduce one worthy successor to the *Spectator* writers in Oliver Goldsmith, whose miscellanies offer many charming essays, essentially of the familiar type. Contemporary with Goldsmith was Dr. Johnson, who in the *Rambler* and elsewhere wrote heavy-handed imitations of the successes of an earlier generation. By the end of the eighteenth century the essay was practically dead.

In the early nineteenth century came Charles Lamb to breathe a new life into the form and to win for himself a place as a prince of essayists, in some respects quite unsurpassed in the history of the art. He tossed aside the pomposity and the complacent grandiosity of Dr. Johnson, and therewith every shred of classical stiffness that may have clung about Addison, and stood forth a familiar essayist par excellence; free to be his whimsical self; culling from the English literature of the preclassical period whatever in diction, phrase, or imagery struck him as quaint, piquant, and racy; formless in his writings as he chose to be, yet binding, as by some invisible chain of mood or sentiment, seemingly rambling essays into a satisfying unity and harmony. Once more in his work the essay justifies itself as for certain types of mind an incomparable vehicle of self-expression. While Lamb was writing, essays with a distinctive charm and flavor were coming from the pen of a lesser literary light, Leigh Hunt.

With the first quarter of the nineteenth century, there came, too, a remarkable development of the formal essay, literary and other. *The Edinburgh Review*, *Blackwood's*, and *Fraser's* assembled a notable group of essayists. At this time, Hazlitt, Jeffrey, and De Quincey were active, and in 1825 Macaulay published his earliest essay, "Milton." Then, too, began to appear the masterly essays of Carlyle. With these men and others the formal essay reached its full bloom, becoming more varied and elaborate than ever before—critical, controversial, contentious, philosophical, or scientific, and yet retaining such distinctive traits of the form as comparative brevity, a tentative and suggestive, rather than a complete and final, aim, and an air more freely personal, whimsical, and idiosyncratic than would have become more extended and pretentious works. The growing vogue of periodical literature at this time insured the essayist a wide hearing and opened a market for him; and the essay forthwith became increasingly a favorite form for independent thinkers who desired to offer experimentally new theories or to present some observation in art, literature, history, or science, dealing thus at first cursorily and suggestively with data to be embodied later, perhaps, in bulky tomes of sustained logic and masses of ordered facts—witness Spencer's *Synthetic Philosophy* or Darwin's *Origin of Species*. From the days of Charles Lamb to the present, English literature has never lacked distinguished practitioners of the art of essay writing in its two branches of the familiar and the formal essay, as the names of Arnold, Pater, Lang, Stevenson, Dobson, Gosse, Saintsbury, and Arthur Christopher Benson variously and sufficiently attest.

American writers, as essayists, hold an honor-

able place, with the mellow and genial essays of Washington Irving initiating the familiar, and those of Poe early representing the more formal, type. To Emerson's genius the form was precisely suited, and he produced a body of writing in this kind highly distinguished by originality, richness of thought, and a serene and lofty temper. Lowell blended the two types in work likely long to prove informing and, thanks to the robust and attractive personality that is a part of it, delightful. And so, on to this day of William Dean Howells, George Edward Woodberry, and Paul Elmer More, the essay stands a substantial asset to the credit of American literature.

In the country of its origin the essay was, as has been said, long a well-nigh unpracticed form. Certain writings of Voltaire, of Diderot, and of others might pass on the whole as essays, Voltaire, indeed, making free of the word in entitling his *Essai sur les mœurs*; but Voltaire surely would not have claimed, nor would Locke in the case of his *Essay Concerning Human Understanding*, that the work in question had anything in common with the essay proper save in its tentative and experimental nature. There appeared, however, about the middle of the nineteenth century, a great French essayist who produced through a prolific literary career an imposing array of essays of prime quality. The reference is of course to Sainte-Beuve. This accomplished writer knew how to blend the appealing personal note of the intimate essay with a wealth of ordered thought and a scholar's store of precise knowledge, which, together with a wonderful literary faculty, resulted in his splendid series of studies and portraits, warmed as if by the spirit of life itself, and of the most varied and alluring interest. From Sainte-Beuve's day, uncounted French essayists, many of them artists, scholars, and thinkers, and some of them all three in one, have brought forth unceasingly works in this kind which are part of the literary glory of France and a perennial delight to readers the world over. The tradition of the French essay was ably upheld to the end of the last century and beyond by such men as Gautier, Brunetière, Anatole France, Jules Lemaitre, and Émile Faguet.

ESSAY CONCERNING HUMAN UNDERSTANDING. A famous philosophical work by John Locke (1690).

ESSAY ON CRITICISM, AN. A didactic poem by Alexander Pope (1711), laying down the canons of poetic taste and verse structure. The poem abounds in passages which have become familiar quotations.

ESSAY ON MAN, AN. A noted philosophical and deistic poem by Alexander Pope, in four parts, which appeared from 1732 to 1734, inspired by the metaphysical vagaries of Bolingbroke.

ESSAYS AND REVIEWS. The title of a volume of essays published in 1860, by six clergymen and one layman of the Church of England—Dr. Frederick Temple, Dr. Rowland Williams, Prof. Baden Powell, H. B. Wilson, Mark Pattison, Prof. B. Jowett, and C. W. Goodwin. The book, which was severely censured for heterodox views by nearly all the bishops and many of the clergy, was condemned by convocation in 1864. The ecclesiastical courts sentenced Dr. Williams and Mr. Wilson to suspension for one year; but on appeal the sentence was reversed by the Privy Council.

The most remarkable among the works put forth in opposition were the *Lids to Faith*, edited by Bishop Thomson, and *Replies to Essays and Replies*, edited by Bishop Wilberforce.

ESSEG. See **ESZÉK.**

ESSEN, *ēs'sen*. A town in the Prussian Rhine Province, situated between the Ruhr and the Emscher, 20 miles northeast of Düsseldorf (Map: Prussia, B 3). The town is substantially built, with clean, well-laid-out streets. The cathedral, founded in 873, is one of the oldest churches in Germany. Its treasury contains some valuable works of art. Among modern secular buildings are the Gothic Rathaus, in front of which stands a statue of Alfred Krupp, the new courthouse, and the Municipal Theatre. The town's affairs are administered by a municipal council of 36 and an executive board of eight members. It has a modern sewage system, an excellent water supply, municipal gas works, and an abattoir. Its educational institutions include a gymnasium, a high school for girls, several mechanical and industrial schools, a school of mines, and a royal agricultural school. Situated in the centre of one of the richest coal and iron regions of Germany, Essen has excellent facilities for an extensive iron industry. First among the industrial establishments are the famous Krupp steel and iron works, which employ more than 43,000 men. There are also a number of smelters, boiler works, manufacturing of walking sticks, dyestuffs, bricks, and liqueurs. In 1911 the chambers of commerce of Essen and Mulheim-Oberhausen were united in a single body with headquarters at Essen. Essen has good railway facilities and an electric street railway. It is the seat of a United States consular agency. The borough of Rüttenschied was taken into the city limits in 1905, and the commune Huttrop in 1908. Pop., 1900, 118,863; 1910, 294,653. Although the industrial activity of Essen is only of recent growth, the town itself is very old, tracing its origin to the famous Benedictine nunnery of the same name, founded in 873 A.D. In the tenth century it was given municipal privileges by the Abbess Hagona. It was taken by the Spanish and the Dutch in the seventeenth century, and was annexed to Prussia in 1813. Consult Kellen, *Die Industriestadt Essen in Wort und Bild* (Essen, 1902), and Zweigert, *Die Verwaltung der Stadt Essen im 19. Jahrhundert* (Essen, 1902).

ESSEN, **HANS HENRIK**, COUNT (1755-1824). A Swedish statesman, born at Kaiås, West Gotland. He was educated in the State University at Upsala, then entered the army, becoming a cornet at 18, and accompanied Gustavus III in his travels and campaigns. He became Governor of Stockholm in 1795, and Governor-General of Swedish Pomerania and Rügen in 1800, and in 1807, as commander of the Pomeranian army, distinguished himself by his defense of Stralsund against the French. Upon the revolution of 1809 he received the title of count and a place in the Council of State. In 1810 he was sent as Ambassador to Paris by Charles XIII, and his negotiations with Napoleon's ministers restored Pomerania to Sweden. He was promoted field marshal in 1811; was sent against Norway (1813) and was Governor of that country (1814-16) after its union with Sweden, and in 1817 became Governor-General of Skåne, an old province in southern Sweden. Consult the biography (Malmö, 1855) by Wieselgren.

ESSENCE (Lat. *essentia*, existence, from *esse*, to be). In logic, that which is included in the logical definition (q.v.) and is opposed to accidents. But as definitions are based upon classifications into genus and species, and as there is no single absolute objective classification, but all our classifications are controlled by some prevailing interest, which selects what is relevant to its purpose, it follows that what is essence according to one classification is accident according to another. The essential in logic as in life is what a particular purpose demands. In metaphysics essence is sometimes used as equivalent to substance (q.v.). In theology, Athanasius and other Greek writers distinguish *ousia*, *ousia* (essence or substance), denoting what is common to the Father, Son, and Holy Spirit, from *hypostasis* (person), denoting what is individual, distinctive, and peculiar to each person.

ESSENCE DE PETIT GRAIN, *ēs'sāns' de pe-tē' grān* (Fr., essence of small grain). A perfume obtained by the distillation of small, unripe oranges, about the size of a cherry.

ESSENCES. See **SPIRITS.**

ESSENES, *ēs-sēnz'*. A Jewish brotherhood, whose origin can be traced back to the second century B.C., and which ceased to exist in the second century A.D. They first appear in history during the early period of the Maccabean uprising and were doubtless an expression of the general tendency towards religious separatism characteristic of that time. The derivation of the name is doubtful. Its source may perhaps lie in the Aramic *ḥesē*, through the plural absolute *ḥesēm*, or the emphatic *ḥesayyā* (pious) which would correspond to the two Greek names most largely used to designate the order, *Ἐσσηνοί*, *Ἐσσηνοί*, and *Ἐσσαῖοι*, *Ἐσσαῖοι*. As an organization it was confined to Palestine, having its chief, if not its only, settlements on the shores of the Dead Sea, though it represented tendencies of thought and life which were generally prevalent in that time and consequently manifested themselves in many regions, especially where Judaism was present. Many of the order resided in the villages and even in the larger towns and cities of Palestine, which was not inconsistent with their principles, though seclusion was more congenial to their manner of life.

Information regarding the order is meagre, being practically confined to that received from the elder Pliny, Josephus, and Philo, who alone speak of the Essenes from personal knowledge. No mention is made of them in the Bible or in Rabbinical literature. From these sources we learn that their most distinctive features were the strictness of their organization, their intense regard for ceremonial purity, including hyper-Sabbatarianism, and their practice of the community of goods. A probation of one year was required before the novice could be admitted to the lustrations, and a further probation of two years before he could obtain entrance to the common meal and take the oath of full membership. This oath demanded absolute obedience and secrecy, and when broken was punished by an expulsion that, because of the continuance of the binding requirement that no food should be taken which was ceremonially unclean, was equivalent to death by starvation. As regards their ceremonial purity, the special points of insistence were abstinence from sexual intercourse,—though there were some, constitut-

ing, according to Josephus (*Wars*, II, viii, 13), a different order within the society who married—innumerable washings, scrupulous bodily cleanliness, the avoidance of contact with lower orders in the brotherhood, the exclusive wearing of white raiment, and particularly the peculiar ceremonial requirements of their common meal, to which none but full members of the order were admitted, the food of which was specially prepared by their priests, and the whole conduct of which partook of the nature of a sacrificial feast. As communists, all possessions and all rewards of labor were held in common and distributed according to need. The chief employment of the brotherhood was agriculture, though handicrafts of all kinds were carried on—the only prohibition being trading, as leading to covetousness, and the manufacture of weapons and instruments which might injure men, as being against their fundamental principle of peace, though some members of the order were found among the leaders and the fanatic followers in the Jewish War. As a society they were the first in history to condemn slavery, in practice as well as in theory, as violating the brotherhood of man.

The order had its chief roots in Judaism, its struggle after ceremonial purity showing it to be a refinement of Pharisaism. At the same time it had elements so strongly at variance with Judaism in general, and Pharisaism in particular, as to suggest influences foreign to Palestine. These elements were especially the rejection of animal sacrifices, by which its members were excluded from the temple worship; the peculiar attention to the sun, which was considered as representing the divine brightness, the members praying towards it at its rising and avoiding all uncovering of themselves before it; and especially the view entertained regarding the origin, present state, and future destiny of the soul, which was held to be pre-existent, being entrapped in the body as in a prison and having before it, as a reward of righteousness, a blessed paradise in the farthest west, and, as a penalty of iniquity, a dark and gloomy cavern full of unending punishments. As to what these foreign influences were, there is considerable discussion, in which perhaps no conclusions can be reached beyond the general one that they were Oriental, rather than Greek, gathering around an essential dualism whose influence can be traced in other peculiarities of the order's belief and custom. This is confirmed by the fact that Oriental influences were prevalent in the West from the third century B.C. to the third century A.D., within which time Essenism flourished.

It is an interesting question as to how much Christianity owed to Essenism. It would seem that there was room for definite contact between John the Baptist and this brotherhood. His time of preparation was spent in the wilderness near the Dead Sea; his preaching of righteousness towards God, and justice towards one's fellowmen, was in agreement with the propaganda of Essenism; while his insistence on baptism was in accord with the Essenic emphasis on lustrations. But the Baptist was much more of an ascetic than an Essene would have needed to be, and had a Messianic outlook, which does not seem to have entered into the Essenic belief. Doubtless the fundamental teachings of Essenism—love to God, to virtue, and to fellowmen—which also existed in Judaism outside Essenic

circles, had vital agreement with the precepts of Christianity; so that from this element in Judaism in general Christianity may have taken many of its earlier converts, while it is more than probable that Christianity's world-wide development of these common ideals did as much as anything to prepare Essenism for its final disappearance as a distinctive organization.

Bibliography. A large literature has been produced on this subject. Among the later books, consult: Lightfoot, "Excursus," in *Commentary on Colossians and Philemon* (3d ed., London, 1879); Schürer, *Geschichte des Jüdischen Volkes zur Zeit Jesu* (3d ed., 3 vols., Leipzig, 1898-1901); Friedländer, *Die Religiösen Bewegungen Innerhalb des Judenthums im Zeitalter Jesu* (Berlin, 1905); Bousset, *Religion des Judenthums* (2te Aufl., Berlin, 1906); Pfeiderer, *Primitive Christianity* (Eng. trans., New York, 1906); Fairweather, *The Background of the Gospels* (ib., 1908). Also the article by Moffatt, in *Encycl. of Religion and Ethics* (New York, 1912), which quotes at length the original sources. See JEWISH SECTS and its bibliography.

ESSENTIAL OIL. See OILS.

ESSENTUKI, or **ESSENTUKSKAYA**. A watering resort in the Territory of Terek, in the Northern Caucasus, Russia, about 10 miles northwest of Pyatigorsk (Map: Russia, F 6). It is situated at an altitude of about 2000 feet and is much frequented during the summer months because of its cold alkaline springs. Pop. (est.), 8000.

ESSEQUIBO, *ēs'se-kē'bō* (native name *Dis-sequebe*). The largest river of British Guiana, rising about 1° north of the equator on the north slope of the Akarai Mountains, which separate its valley from that of the Amazon River (Map: Guiana, F 3). It flows in a northerly direction, emptying into the Atlantic west of Georgetown, after a course of over 600 miles. At its mouth, an estuary about 20 miles wide is formed, containing numerous islets. Its course is very tortuous and interrupted by numerous cataracts, while its mouth is closed by bars which can be passed by deep-draft vessels only during high tide. It is navigated for a considerable distance, and even heavy vessels can ascend for a distance of about 40 miles from its mouth. Its chief tributaries are the Rupununi, Potaro, and the Cuyuni-Mazaruni, all from the west. On the banks are forests of locust tree, ironwood, ebony, greenheart, and other fine timber trees. The region adjoining the river was the subject of conflicting claims between the British and Venezuelan governments, which led to the Arbitration Treaty of Feb. 2, 1897. The award was made Oct. 3, 1899. See VENEZUELA, *History*.

ESS/ES, **COLLAR OF**. A collar composed of a series of the letter S. See SS, **COLLAR OF**.

ESSEX (AS. *East-Saxa*, East Saxons). A maritime county in southeastern England, bounded on the north by Cambridge and Suffolk, on the east by the North Sea, on the west by the County of London and Hertford, and divided from Kent on the south by the Thames estuary (Map: England, G 5). It has 85 miles of coast line, and an area of 1530.5 square miles. On the coast the surface is low-lying and marshy, but from the centre to the north is undulating and well wooded. The chief rivers are the Lea, Roding, Roach, Blackwater, and Colne. Chalk, brick, clay, and sea salt are the chief mineral

products. Wheat of excellent quality and barley are largely grown, and stock is raised for market purposes. About four-fifths of the area of the county is under cultivation. There are extensive manufactures of chemicals, railroad machinery and agricultural implements, powder, lime, silks, etc., and valuable brewing, fishing, and oyster industries. Capital, Chelmsford. Pop. (with associated county borough), 1901, 1,083,998; 1911, 1,350,881.

Essex figured prominently in early English history. At the time of Cæsar's invasion it was inhabited by the Trinobantes, of whose advanced civilization much numismatic evidence remains. The Romans thoroughly colonized the country, as is shown by relics dug up at Colchester, as well as by the Roman military road which crosses the country. When the Roman power declined the Saxons made Essex the object of their raids, finally overrunning the land and incorporating it with the domain of the Count of the Saxon Shore. After the withdrawal of the Romans, it was occupied by the East Saxons, whence its name, and became a member of the Saxon heptarchy. The East Saxons continued to be ruled by a separate dynasty until about 823, when they were absorbed by the West Saxons, which became the ruling power in England. During the struggles of Alfred the Great with the Danes, Essex was the scene of many fierce conflicts, till, by the Peace of Wedmore (879 A.D.), it was recognized by Alfred as part of the Danish territory of Guthrum. Later the Danes were driven out by Alfred's son, Edward the Elder. In 1045 Essex became part of the earldom of Harold, but at the time of the Norman Conquest it had passed into the domain of the family of Swene. Beginning with the Norman kings, and continuing to the present time, it has constituted an earldom of the crown, and has passed through several family histories.

ESSEX. A town and railway junction of Essex County, Ontario, Canada, 15 miles southeast of Windsor, on the Michigan Central Railroad (Map: Ontario, B 9). It has electric railway connection with Kingsville, Windsor, and Leamington. The manufacturing industries include flour and planing mills, a canning factory, and brick and tile works. Natural gas is found in the vicinity. Pop., 1901, 1391; 1911, 1353.

ESSEX. A town in Middlesex Co., Conn., 31 miles (direct) southeast of Hartford, on the Connecticut River, and on the New York, New Haven and Hartford Railroad (Map: Connecticut, F 4). The town contains a public library. It has a large piano factory and a bit factory. Pop., 1900, 2530; 1910, 2745.

ESSEX. A town in Chittenden Co., Vt., 12 miles northeast of Burlington, on the Central Vermont Railroad (Map: Vermont, B 3). It contains the Essex Classical Institute. The town is situated in a purely agricultural and dairying region. Pop., 1900, 2203; 1910, 2714.

ESSEX, ARTHUR CAPEL, first EARL OF (in the Capel line) (1632-83). An English statesman. Charles II sent him to Denmark in 1659 as Ambassador in order to be rid of his opposition at home; but his conduct while there so pleased the King that upon his return in 1671 he was made Privy Councillor and in 1672 Lord Lieutenant of Ireland. He gave that country a remarkably efficient, liberal, and honest government until 1677 when, owing to the intrigues of his enemies, he was recalled. He joined the

country party in England under the leadership of Halifax and in 1679 was Commissioner of the Treasury. In the following year he became a member of Shaftesbury's party which urged the exclusion of James from succession to the throne. Although he did not approve of the extreme measures of this faction he was arrested and imprisoned in 1683 in the Tower, where he was shortly afterward found with his throat cut. Consult his *Letters* with an account of his life (London, 1770; 2d ed., 1783), and *Selections from the Correspondence of Arthur Capel* (London, 1913).

ESSEX, ROBERT DEVEREUX, second EARL OF (1567-1601). An English court favorite and statesman. He was born at Netherwood, Herefordshire. Entering Trinity College, Cambridge, in 1579, he was given the degree of M.A. in 1581, and three years afterward his guardian, Lord Burghley, introduced him at court, where he became a favorite of Elizabeth. Accompanying his stepfather, the Earl of Leicester, to Holland, he distinguished himself at the battle of Zutphen. After the death of Leicester, Essex continued to rise in the favor of Elizabeth, who loaded him with honors. She gave him command of the forces sent in 1591 to assist Henry IV of France against the Spaniards; and five years afterward she appointed him joint commander with Lord Howard in the expedition against Spain. Though Essex displayed exceptional courage at the taking of Cadiz, the expedition was fruitless, so that on his return he had to defend himself against various accusations. In 1597, however, he was made Earl Marshal of England, and when Burghley died, Essex succeeded him as Chancellor of Cambridge. At the outbreak of the rebellion in 1599 he went to Ireland as Lord Lieutenant; but his government was ill-advised and ineffective, and after a few trivial undertakings he concluded with the rebels a truce for which he was regarded at court with grave misgivings. Contrary to the Queen's express commands, he hastened back to London to confront his enemies, and without changing his travel-stained garments he forcibly effected an interview with the Queen in her bedchamber. She received him kindly; but in June, 1600, he was brought to trial before a special court consisting of the principal officers of state and the judges, on charges of contempt and disobedience, and sentenced to dismissal from all offices of state and to imprisonment in his own house during the Queen's pleasure. Through the intercession of Francis Bacon his liberty was soon restored. But when he foolishly tried to excite an insurrection in London to compel Elizabeth to remove his enemies from the council, he was imprisoned, tried, and condemned to death. Elizabeth delayed signing the warrant for his execution in the hope that he would implore her pardon. He was beheaded Feb. 25, 1601, after defending himself with pride and dignity. Consult: Bacon, *Declaration of the Practises and Treasons . . . Committed by Robert, Late Earl of Essex* (London, 1601); Spedding, Bacon, i (ib., 1881), chief authority, should be read with the following: Abbott, *Bacon and Essex* (ib., 1877), more favorable than Spedding; Barrow, "Earl of Essex," in his *Memoirs of the Naval Worthies of Queen Elizabeth's Reign*, pp. 333-376 (ib., 1845); Birch, *Memoirs of the Reign of Queen Elizabeth* (ib., 1754); Bruce, *Correspondence of King James VI of Scotland with Sir Robert Cecil, etc.* (Westminster, 1861);

Lohmann, *Essex-Trauerspiel* (Leipzig, 1856); Croxall, *Memoirs of the Unhappy Favorite* (London, 1729); Wotton, *Characters of Robert Devereux . . . and George Villiers, etc.* (Lee Priory, 1814); Cooper, *Athenæ Cantabrigienses* (2 vols., Cambridge, 1858), for his writings.

ESSEX, ROBERT DEVEREUX, third EARL OF (1591-1646). An English general and politician. He was the son of Robert Devereux, second Earl of Essex, and in 1604 regained possession of his father's titles, which had been attainted in 1601. He was educated at Eton and Merton College, Oxford, and after the accession of James I was one of the companions of the Prince of Wales, afterward Charles I. In 1606 he was married to Frances Howard, daughter of the Duke of Suffolk, but the marriage was a loveless one, and was annulled in 1613. A second marriage was equally unfortunate. In 1621 he saw some service in the Palatinate, and two years later was vice admiral in a naval expedition against Cadiz. In 1626 he refused payment of the forced loan and joined the parliamentary opposition to Charles I, and remained faithful to the cause of popular government in spite of the many favors heaped upon him by the King, who hoped to win him over to his side. In 1639 he was lieutenant general in the army sent against the Scottish Covenanters. Three years later, after the open breach between Parliament and the King, he was made commander of the parliamentary forces. He fought the indecisive battle of Edgehill in 1642, captured Reading in the following year, and relieved Gloucester, which was besieged by Charles I. On his march from Gloucester to London he was intercepted by the royal army and fought the first battle of Newbury. In 1644 he invaded Cornwall, but met with ill success, and, owing, it is said, to his unwillingness to fight against the King in person, the greater part of his army was forced to capitulate at Lostwithiel. Before this he had become embroiled with the House of Commons, because of the appointment of other generals to independent commands in the parliamentary army, and in 1645 he took advantage of the passing of the Self-denying Ordinance to resign his commission.

ESSEX, THE. A United States frigate of 860 tons, in service during the War of 1812 under the command of David Porter. Farragut was a midshipman on the ship on her first expedition. She captured the *Alert* in 1812, and after operations in the Pacific surrendered to the *Phæbe* and *Cherub* in Valparaíso harbor on March 28, 1814.

ESSEX, THOMAS CROMWELL, EARL OF. See CROMWELL, THOMAS.

ESSEX, WALTER DEVEREUX, first EARL OF (in the Devereux line) (1541-76). An English adventurer. He assisted in suppressing the northern rebellion under the earls of Northumberland and Westmoreland and in 1572 was made a knight of the Garter and Earl of Essex. In the following year Queen Elizabeth accepted his offer to subdue and colonize the Province of Ulster in Ireland. After landing in that country his forces were diminished by sickness, death, and desertion to about 200 men, and he was obliged to confine his efforts to petty raids—burning the corn stacks and fields of the O'Neill clan. In 1574 he captured by treachery Sir Brian MacPhelim, leader of the O'Neills, and executed him, his wife, and his brother at Dublin. He also massacred several hundred fol-

lowers, chiefly women and children, of Sorley Boy McDonnell on the Isle of Rathlin. He was recalled in 1575, but returned to Ireland in the following year as Earl Marshal.

ESSEX HOG. See Hog and Plate of Hogs.

ESSEX JUNCTION. A village in Chittenden Co., Vt., 8 miles east of Burlington, on the Central Vermont Railroad (Map: Vermont, B 3). The village contains a United States government post and Fort Ethan Allen. It is situated in a rich farming region and has a corn-canning factory, brickyards, grain and lumber mills, and a butter factory. The water works are owned by the municipality. Pop., 1900, 1141; 1910, 1245.

ESSEX JUNTO. A term used for the first time by a Colonial governor of Massachusetts to designate a body of men from Essex County, who had arrayed themselves against his policy. It was next employed by Governor Hancock in 1781, against the chief supporters of James Bowdoin, nominated for Governor as the representative of the traditional, as opposed to the popular, politics of the day. The term entered national politics about 1798, as applied opprobriously to the Federalist leaders in Massachusetts, who opposed Adams and his policy towards France. Among these were Timothy Pickering, Theophilus Parsons, Fisher Ames, George Cabot, Stephen Higginson, and the Lowells, mostly Essex County men. Adams charged that they were allied with England, but the combination seems not to have had any treasonable intent. Later these same men were prominent in opposition to the Embargo and to the War of 1812, were party chiefs of the extreme Federalists, and were prime movers of the measures which culminated in the Hartford Convention (q.v.), so that the name became a synonym for New England Federalism. Consult Lodge, *Life and Letters of George Cabot* (Boston, 1878).

ESSEX SKULL. See MAN, ANCIENT TYPES.

ESSIPOFF, ɛs'sə-pōf, ANNETTE (1851-). A Russian pianist, born in St. Petersburg. She was one of Leschetitzky's most brilliant pupils. She made her début in St. Petersburg in 1874; then entered upon artistic travels which brought her in 1876 to the United States, where her playing was greatly admired. In 1880 she married Leschetitzky, but they were divorced. From 1893 to 1908 she was professor of pianoforte at the St. Petersburg Conservatory.

ESSLING, or **ESSLINGEN**. A village in Lower Austria, 7 miles east of Vienna. Between it and the village of Aspern a bloody battle was fought between the French and the Austrians on May 21-22, 1809. This engagement is generally known as the battle of Aspern and Essling. See ASPERN.

ESSLINGEN, ɛs'lng-en. A town in the Kingdom of Württemberg, Germany, situated on the Neckar, in the centre of a fertile district, 7 miles east-southeast of Stuttgart (Map: Germany, C 4). The river is here crossed by a bridge constructed in the thirteenth century and restored in 1838. Esslingen consists of several suburbs, and of the inner town, which is partly surrounded by walls, dating from 1216. Three of its churches are worthy of notice: the Liebfrauenkirche, a handsome Gothic structure of the fifteenth century; the church of St. Dionysius, a basilica in the transition style, founded in the eleventh century; and that of St. Paul, in the early Gothic style, dating from 1268. In addition may be mentioned the old and the new

Rathaus and the castle of Perfried. The industries include the largest machine works in Württemberg (employing 2200 men), large railway shops, the manufacture of gold, silver, and plated ware, worsted, lithographed work, gloves, lacquer ware, gelatin, and buttons; it has also cotton mills and beer breweries. Esslingen is famous for its sparkling Neckar wine known as Esslingen champagne. Pop., 1900, 27,197; 1910, 32,364. Esslingen was founded in the eighth century, and originally belonged to the Duchy of Swabia. In 1209 it was made a free Imperial city. The Swabian League was formed at Esslingen in 1488. In 1802 the town came into the possession of Württemberg.

ESS'ON, WILLIAM (1838-1916). A British mathematician, educated at the Inverness Royal Academy and at St. John's College, Oxford (M.A.). From 1860 to 1897 he was a fellow of Merton College, where he served as bursar, and he was also fellow of New College. He was deputy Savilian professor at Oxford University from 1894 to 1897, and thereafter full professor. Elected a fellow of the Royal Society, he published in the society's *Transactions* "The Laws of Connection between the Conditions of Chemical Change and its Amounts" (1864, 1866, and 1895) and "Variations with Temperature of Rate of Chemical Change" (1912).

ESS'ONITE. See GARNET.

ESSONNES, ès-sün'. A town in the Department of Seine-et-Oise, France, a suburban municipality 1 mile southwest of Corbeil, and 10 miles southeast of Paris (Map: France, N., J 3). It has iron foundries, machinery, linen, and notable paper factories. Pop. (commune), 1901, 9374; 1911, 9348.

ESTABLISHMENTS, ECCLESIASTICAL. Those religious bodies which in various countries have definite legal relations to the state, involving special privileges and duties. The origin of such a connection usually dates back to a period when the inhabitants of the country were practically unanimous in their religious views. When a sovereign was moved to take definite steps in support of religion, it could naturally be only of that type of religion which was to him and his subjects the normal and recognized type. In some cases, notably that of England, the idea grew up with the country and antedates any possibility of formal legislation. In England the term "by law established" first occurs in the canons of convocation in 1604, but the relation itself was far earlier. (See ENGLAND, CHURCH OF.) When, at the Reformation, the bulk of the population of any country transferred its allegiance from one religion to another, the privileges of an establishment were usually transferred in the same manner. The case of Ireland was peculiar; the connection of the Protestant church of that country with the Church of England allowed it to maintain its position as a privileged body, though in a hopeless minority, until the Disestablishment Act of 1870 was passed by Mr. Gladstone. The connection between church and state may operate in various ways—by the sovereign assuming to nominate the chief ministers of the religious body (see GALRICAN CHURCH; CONCORDAT); by taxation on the part of the state, or indirectly with its sanction, for the support of the clergy and of public worship; by a regulation of the uses of property devoted to religious purposes and of the procedure and ritual of the church; by the maintenance of ecclesias-

tical courts for the enforcement of canonical laws; by the provision of a system of education under ecclesiastical supervision, and in some cases by the prohibition of dissenting worship. (See TOLERATION; NONCONFORMISTS.) In Protestant countries the sovereign is usually considered the head of the established church; Queen Victoria used punctiliously to mark her sense of the requirements of this position by always attending the services of the Presbyterian church in Scotland and of the Anglican in England. Thus, also, in Russia, the Czar practically occupies a similar position. The restrictions upon ecclesiastical freedom inseparable from such a position have caused many devoted churchmen to feel that the advantages were more than outweighed by the drawbacks; and thus in England such men have been found, in the last 50 years, in the ranks of the advocates of disestablishment. The movement there has, however, been chiefly supported by Non-conformists of a political type, who maintain the view that the modern free state has no right to discriminate in lawful things between various classes of its subjects. The agitation became strong about 1870-80. England, Russia, Greece, Sweden, Norway, Prussia, and some other German states have established churches. (See CIVIL CHURCH LAW, AMERICAN.) For the details of the subject applying to various countries, see the articles on those countries.

ESTAING, ès-tân', CHARLES HECTOR, COUNT D' (1729-94). A French admiral. After serving in India under Lally-Tollendal and suffering imprisonment at the hands of the English, he entered the royal navy and was made lieutenant general in 1763 and vice admiral in 1777. In 1778 he commanded the fleet sent to aid the United States against Great Britain, bringing with him Gérard, the first French Ambassador to the United States. He planned with the American generals a combined land and naval attack on Newport and forced the British to burn a number of vessels in the harbor. Admiral Howe came, with an English fleet, to relieve Newport, and D'Estaing put to sea to engage him. A sudden storm separated the fleets, and D'Estaing put into Boston to repair his shattered ships. In November he sailed to the West Indies, where he captured St. Vincent and Grenada. With 22 ships he coöperated Oct. 9, 1779, in the unsuccessful attack on Savannah and was himself wounded. The following year he returned to France and was in command of the French and Spanish fleet before Cadiz when the treaty of peace was signed in 1783. He was in favor of the principles of the French Revolution in their more moderate form, and was elected to the Assembly of Notables in 1787. In 1789 he commanded the National Guard. In 1792 the Legislative Assembly chose him admiral. In 1793 he bore testimony in favor of Marie Antoinette, but without deserting his constitutional principles. The following year, in spite of his work for the Revolution, he was charged as a noble, tried, condemned, and executed, April 28, 1794. He wrote some poetry, a work on the colonies, and a tragedy, *Les Thermopyles* (1789).

ESTAMPES, a'tânp', or ETAMPES, ANNE DE PISSELEU, DUCHESSE D' (1508-c.1585). A mistress of Francis I of France. She was maid of honor to his mother, Louise of Savoy, and the King fell in love with her upon his return from Spain in 1526. In 1536 she entered into

a formal marriage with Jean de Brosse and was created Duchess of Estampes. She is said to have been beautiful, witty, and highly educated, and to have exercised great influence over the King. She had a rival in Diane de Poitiers (q.v.), mistress of the Dauphin Henry, who succeeded to the throne in 1547. Political parties centred about the persons of the two women till the accession of Henry in 1547, when the Duchess was banished to her estates, became a Protestant, and lent important services to the Huguenot cause. Consult Paulin Paris, *Études sur François Ier* (Paris, 1885).

ESTATE (OF. *estat*, Fr. *état*, from Lat. *status*, state, condition, from *stare*, Gk. *στάω*, *histanai*, Skt. *sthā*, to stand). The technical term of the common law for property interests in land. Land is not, in our legal system, like goods and chattels, capable of absolute ownership by a subject. The feudal system, under whose influence our law of real property was developed, vested the ultimate ownership of all land in the King, all private owners being deemed to be merely tenants, holding their lands in subordination to the paramount rights of the crown. The interest of such a tenant was described as his *estate* in the land, i.e., his *status* with reference to it; and this estate, however complete and unqualified it might be, was always regarded as something less than absolute ownership, and as leaving a reversionary interest in the superior lord, some portion of the ownership undisposed of by him. The term "estate" was originally applied only to those interests in land technically known as freeholds, which were classified as real property; but it has in course of time been extended by analogy to include other interests, such as leaseholds, the interests of mortgages, and certain creditors' rights in land, all of which are in our law classified as personal property. All of these interests have this element in common, that they exist in subordination to a paramount or underlying title, in which they may ultimately be absorbed, and which no act of the "tenant" or temporary owner can effect. This is not true, however, of most forms of personal property, as goods, etc. These are held by the owner absolutely, free from any superior proprietorship or lordship, and accordingly his ownership cannot be described as a tenancy or an estate. Hence the expression "personal estate," sometimes employed by analogy with "real estate," is, strictly speaking, inaccurately used as a substitute for "personal property."

The primary classification of estates, following the line of cleavage above indicated, is into *estates of freehold* and *estates not of freehold*. In the former are included the three great forms of freehold tenure—the fee simple, fee tail, and life estates, the two former of which are further described as estates of inheritance, and the last as an estate not of inheritance. Estates not of freehold are more commonly described simply as tenancies—as tenancies for years (leasehold estates), tenancies at will, and tenancies at sufferance—the term "estate" not being usually applied to the last two of these. Intermediate between the leasehold estate and the tenancy at will there has been developed a new form of tenure known as an estate or tenancy from year to year, which, though usually classified with the latter, shares many of the characteristics of both. All of these forms of estate will be described under their appropriate titles.

The most striking fact in connection with this classification of estates is its definiteness and rigidity. The several varieties of estates are sharply differentiated from one another. Each class has its characteristic features or incidents which mark it off distinctly from every other class, and every tenure or holding of land must conform to one or another of them. There are no intermediate estates, nor can the qualities of one be attached at will to another. No one can create a freehold which is not either a fee simple, a fee tail, or a life estate, and no one can create a fee simple which has the limited heritability of a fee tail, nor an inheritable life estate, nor a leasehold estate which shall descend to the heir instead of passing to the executor or administrator of the owner upon his death. Neither is it possible to attach novel incidents to an estate, nor, usually, to deprive it of those which belong to it. Thus, in a devise or conveyance of land to A and his heirs, a proviso that it shall be inalienable, or that the inheritance shall be confined to male heirs, will be disregarded as incompatible with the nature of a fee simple; and, there being no intermediate estate such as the one described, i.e., an inheritable estate which is inalienable or in which the inheritance is limited to males, the devise is treated as an ordinary fee simple with the usual incidents of such an estate.

Apparent exceptions to this rule are afforded by the fee-tail estate, in which inheritance is confined to the issue of the tenant, and may be still further limited to his male or his female issue, etc., and by the tenancy from year to year. But these are themselves ancient forms of tenure, and not mere variations of the fee simple and the tenancy at will from which they were respectively derived, and have long since crystallized into forms as definite and invariable as those of the older estates. While the incidents of these time-honored forms of landholding have sustained great changes through legislation and the process of judicial decision, no new forms or varieties of estate have come into existence for upward of two and one-half centuries, and no additions to the list seem likely to be made in the near future. The sporadic revival of the ancient qualified or limited fee will be referred to in connection with the fee simple (q.v.). For the employment of the term "estate" in connection with equitable interests in land, see **EQUITABLE ESTATE**. See also **REAL PROPERTY**; **TENURE**; and the authorities there referred to.

ESTATE. In a political sense, a distinct class or order in society. The three estates under the feudal system were the nobles, the clergy, and the commons. The feudal theory was that the basis of all power was property in land, and the clergy held their position in the feudal order by virtue of their landed proprietorship. As the lay rulers grew stronger, the temporal authority of the clergy declined, until at the present time they form a corporation rather than a class. The history of the later Middle Ages is a record of the rise of the third estate. They were the representatives of the merchant class, the *bourgeoisie*. They first arose to prominence in the free cities of Italy and of the Hanseatic League. In Spain and England, especially, the absolute power of the crown was the product of the alliance of the King and the third estate against the nobles. Before the Union. (1707) the term "Estates of the Realm" was used in Scotland

as equivalent to Parliament. The Legislative Assembly of Holland was also known as the States General. The States General of France, composed of the three estates, was first convened at the beginning of the fourteenth century. The last meeting previous to the Revolution of 1789 was in 1614-15. At the outbreak of the Revolution the summoning of this body was resorted to when all other expedients failed. The old established custom was to vote by orders, but as the third estate (*tiers-état*) would thus have been outvoted in the new Assembly, its members determined to introduce the new principle of voting individually. In this they succeeded, and, with their success and the organization of the National Assembly, the French Revolution may be said to have begun. The term "fourth estate" is often applied to the press. Its first use in that sense is attributed by Carlyle to Edmund Burke, who pointed to the reporters' gallery in the House as containing a fourth estate more powerful than the other three.

ESTATE, SEPARATE. See SEPARATE ESTATE.

ESTATE DUTY. See DEATH DUTIES.

ESTE, ɛs'tà (Lat. *Ēste*). A city of Padua, north Italy, 19 miles southwest of Padua (Map: Italy, C 2). The ancient house of Este (q.v.) held control of it from 961 to 1288, followed in turn by the Carrara, Scaliger, and Visconti families. Here are the ruins of the ancestral castle. In the city museum are Roman inscriptions, in the Euganeo Preistorico Museum is an important collection of antiquities. The manufactures are ironware and earthenware and cordage. Pop. (commune), 1901, 10,962; 1911, 11,704. Consult Nuvolato, *Storia d'Este* (Este, 1850).

ESTE, ɛs'tà, HOUSE OF. One of the oldest and most illustrious families of Italy. It owed its origin to one of the petty princes who governed Tuscany in the times of the Carolingians, and who were in all probability of Lombard extraction.—The first whose figure is more than a mere shadow is ADALBERT, or OBERTO, Marquis of Este, one of the Italian nobles who offered the crown of Italy to Otho of Saxony. He is afterward styled *Comes Sacri Palatii* and appears to have been one of the greatest personages in the realm; he married a daughter of Otho, and died about 972 A.D. His family divided at an early period into two branches, the German and the Italian. The former was founded by Welf or Guelfo IV, who received the investiture of the Duchy of Bavaria from the Emperor Henry IV in 1070; the latter by his brother Fulco I (1060-1135). The houses of Brunswick and Hanover, and consequently the present sovereigns of Great Britain, also called Este-Guelphs, are descended from the German branch. (See BRUNSWICK, HOUSE OF.) In the twelfth and thirteenth centuries the history of the Italian family, as heads of the Guelph party, is interwoven with the destinies of the other ruling families and small republics of northern Italy. During this period they gained permanent possession of Ferrara and the March of Ancona (1276) and afterward of Modena and Reggio (1288-90). They were widely celebrated as patrons of art and literature. One of the most illustrious was Azzo VII (1205-64), who encouraged Provençal troubadours to settle at his court at Ferrara and also founded schools in that city.—ALFONSO I (1486-1534) was equally distinguished as a soldier and a statesman and

was celebrated by all the poets of his time, particularly by Ariosto. His second wife was Lucrezia Borgia (q.v.). His quarrel with the Popes Julius II, Leo X, and Clement VII was unfortunate, as an interdict was laid upon him for his adherence to the League of Cambray, and his papal fiefs were declared forfeited. After the capture of Rome, in 1527, the Duke was restored to his former possessions by Charles V.—His successor, ERCOLE II (1508-59), married Renata, daughter of Louis XII of France, and attached himself to Charles V. He and his brother, a dignitary of the Catholic church, were also liberal patrons of art and sciences; the latter erected the magnificent Villa d'Este at Tivoli.—ALFONSO II (died 1597) was fonder of luxury and splendor than of art and literature. He it was who persecuted the poet Tasso. He was also an unsuccessful aspirant for the Polish crown.—ALFONSO IV, who lived in the latter half of the seventeenth century, was a lover of the fine arts, and founded the Este Gallery of Paintings at Modena. His daughter, Mary of Modena, married James II of England.—RINALDO (1655-1737), by his marriage with the daughter of the Duke of Brunswick-Lüneburg, united the German and Italian houses, separated since 1070. Like his predecessors he was a faithful ally of Austria, although his son took the part of Spain against Maria Theresa. The male line of the house of Este in Italy became extinct on the death of his grandson, Ercole III, in 1803, his possessions having been previously seized by the French invaders and annexed to the Cisalpine Republic. His only daughter married the Archduke Ferdinand of Austria and founded the Austrian house of Este which lasted till 1875. Their eldest son, Francis IV, cousin of the Emperor Francis, was placed on the throne of Modena by the Congress of Vienna, 1814, and on his mother's death obtained the duchies of Massa and Carrara. He was succeeded by his son, Francis V, in 1846. The family of Este was pro-Austrian in sympathy, the result of which proved fatal. In 1859 Charles V was forced to resign his territories to Victor Emmanuel. He died in retirement in 1875, the last representative of the Este family, the title passing to the Archduke Francis Ferdinand, heir to the Austrian throne. A *History of the House of Este* was published anonymously in London in 1681. Consult also: Symonds, *The Renaissance in Italy* (London, 1875-86); Browning, *Guelfs and Ghibellines* (ib., 1893); Sismondi, *Italian Republics* (Eng. trans., ib., 1832); Ciscato, *Storia d'Este dalle origini al 1889* (Este, 1890); Campori and Solerti, *Luigi, Lucrezia e Leonora d'Este* (Turin, 1888); Solerti, *Ferrara e la corte estense* (Castello, 1891); Muratori, *Delle antichità estensi ed italiane* (3 vols., Modena, 1717); Gardner, *Princes and Poets of Ferrara* (London, 1904); Noyes, *The Story of Ferrara* (ib., 1904); Litta, *Famiglie Celebri Italiane* (Milan, 1808).

ESTÉBANEZ CALDERÓN, ɛs-tá'bá-náth kál'dá-rón', DON SERAFÍN (1799-1867). A Spanish poet and novelist. He was born in Málaga, studied law at the University of Granada, and in 1822 was made professor of poetry and rhetoric there. In 1830 he went to Madrid, where he published anonymously his only volume of poems under the title *El solitario* (1831). He also wrote several articles on Andalusian manners for the *Cartas Españolas*, the

only literary journal at that period in Spain. In 1834, during the first Carlist War, he was appointed auditor general of the Legitimist army in the north. In 1836 he was appointed *Jefe-Político* of Logroño, but an accident obliged him to return to Madrid, where he devoted himself to collecting manuscripts of the old national literature, to be the basis of a great critical edition of the *Cancioneros* and *Romanceros*. In 1838 he was appointed *Jefe-Político* of Seville. He served repeatedly as deputy and from 1856 was a member of the Council of State. Estébanz Calderón wrote also a fine novel, *Cristianos y Moriscos* (1838). His *Escenas andaluzas* (1847) are a series of lively sketches of Andalusian life and form a trustworthy account of customs that have largely disappeared. At his death he left a work on the *Expediciones y aventuras de los Españoles en Africa*. The Spanish government purchased his valuable library. Consult Cánovas del Castillo, *El solitario y su tiempo*, etc. (2 vols., Madrid, 1883).

ESTELLA, à-stā'lyā. A town in the Province of Navarre, Spain, situated on the Río Ega, about 20 miles southwest of Pamplona (Map: Spain, D 1). It has a picturesque situation and one of considerable military importance, is well built, with fine streets and squares, and contains several interesting churches. The town is surrounded by a fertile region and is a place of some trade and manufactures. Pop., 1900, 5700; 1910, 5658. Estella is a town of great antiquity, perhaps the ancient Gebala. It played a prominent part in the Carlist uprisings. In 1835 the Carlists took possession of the town, and here in 1839 occurred the execution by the Carlist leader Maroto of five brother generals. During 1873-76 Estella was the main stronghold of Don Carlos and was the scene of several conflicts. Its surrender in February, 1876, occasioned a complete downfall of the Pretender's cause.

ESTEPA, à-stā'pā. A town in the Province of Seville, Spain, situated in a hilly region, about 60 miles east of the city of Seville (Map: Spain, C 4). It has broad and level streets and is defended by an old Moorish castle. The parish church of Santa María la Mayor is an imposing structure in Gothic style with three naves. The chief industries are agriculture and stock raising, and the manufacture of oil, soap, etc. There are jasper quarries in the vicinity. Pop., 1900, 8773; 1910, 8234. Estepa is identified with the ancient Astapa, which became celebrated in the Second Punic War. After an heroic resistance against the Roman besiegers its inhabitants chose death by fire rather than surrender. The Romans subsequently colonized the place. In 1240 it was recovered from the Moors by Ferdinand III.

ESTEPONA, à-stā-pō'nā. A maritime town in the Province of Málaga, Spain, on the Mediterranean, about 25 miles northeast of Gibraltar (Map: Spain, C 4). It is laid out with generally wide but sloping streets, and has a parish church, dating from 1474, which is in ruins. The town is in a fertile region, producing grain, wine, fruits, and vegetables, and has considerable coasting trade, though the harbor lacks shipping facilities. There are also fisheries and fish-curing interests, and manufactures of liquors, leather, rope, corks, brick, and tile. A lighthouse stands on the Punta de la Doncella, near by. Population, 1900, 9307; 1910, 9613.

VOL. VIII.—8

ESTERHÁZY, or **ESZTERHÁZY**, ès'tér-hā-zé. The name of an ancient noble Hungarian family which possesses immense domains in Hungary and traces its descent from Paul Estoras, a mythical descendant of Attila, baptized in the tenth century. Two branches of the family, Zerhazy and Illyeshazy, appear as early as 1238. The latter line became extinct in 1838. The titles of baron, count, and prince were conferred in turn upon members of the family. The first Esterhazy to become celebrated was NICHOLAS (1582-1645), Palatine of Hungary, an ardent supporter of the Counter Reformation. Later members of the family are: PAUL IV (1635-1713), Prince Esterhazy of Galánta. As Austrian field marshal, he distinguished himself in the wars against the Turks, especially at St. Gotthard in 1664, Vienna in 1683, and Buda in 1686. He was made Palatine of Hungary in 1681, and had a share in the overthrowing of Tökölyi (q.v.) and the consolidation of the Hapsburg power in Hungary. He died a prince of the Empire. —NICHOLAS JOSEPH (1714-90), Prince Esterhazy of Galánta, Count of Forchtenstein, grandson of Paul IV, was Privy Councillor, field marshal, and several times Ambassador. He fought bravely in Silesia during the Seven Years' War. He was a patron of the arts and sciences and established a famous orchestra at Eisenstadt, among whose members were Pleyel and Haydn. —NICHOLAS IV (1765-1833), Prince Esterhazy of Galánta, grandson of Nicholas Joseph, traveled widely in his youth; then entered the army, rose to the rank of general, and became prominent in diplomatic affairs. Possessed of an inherited love for the arts, he spent an immense fortune on his collections of pictures and engravings, now at the Museum of Vienna. In 1809 Nicholas refused Napoleon's offer of the crown of Hungary. Haydn found in him a most generous patron. —PAUL ANTON (1786-1866), Prince Esterhazy of Galánta, son of Nicholas IV, was Austrian Ambassador at Dresden in 1800, at Rome in 1814, and at London from 1815 to 1842. He was Minister in the Hungarian cabinet of 1848. In 1849 he retired from public life, but was present as Austrian Ambassador at the coronation of Alexander II at Moscow in 1856. Another prominent member of the family was Moritz, Count Esterhazy (1807-90), diplomat and statesman. Consult Count János Esterhazy, *Description of the Esterhazy Family* (Budapest, 1901).

ESTERIFICATION. See **ESTERS**.

ESTERS (arbitrary variant of *ether*), or **ETHEREAL SALTS**, sometimes inaptly spoken of as "compound ethers." A class of carbon compounds formed by the union of acids and alcohols. Thus, when ordinary alcohol and strong hydrochloric acid are mixed together and heated, they combine according to the following equation:

By analogous reactions the ester called *ethyl nitrate* may be obtained from ordinary alcohol and nitric acid; the ester called *ethyl acetate*, from ordinary alcohol and acetic acid, etc.

Another method of preparing esters, often used in the case of organic acids, is to employ not the acid itself, but its chloride. Thus,

ethyl acetic ester (ethyl acetate) may be prepared by the action of ordinary alcohol upon *acetyl chloride*, CH_3COCl , which is the chloride of acetic acid. The reaction is as follows:

Still another important method of making esters consists in causing the silver salts of acids to react with halogen (usually iodine) derivatives of hydrocarbons. Thus, ethyl acetic ester may be prepared from silver acetate and ethyl iodide (the latter itself made from ethyl alcohol), according to the following equation:

The esters of organic acids, such as ethyl acetic ester, are, as a rule, colorless, pleasant-smelling, more or less volatile liquids. Some occur ready formed in the vegetable world, imparting their odor to fruits and flowers. Artificially prepared esters, therefore, serve to flavor candy, pastry, and perfumes, and are sold under the names of pear oil, apple oil, pineapple oil, etc. Other esters occur ready formed, both in the vegetable and in the animal worlds, and are known as oils and fats (q.v.).

By the action of water esters are broken up into their components (i.e., into alcohols and acids)—a reaction which is greatly furthered by the presence of acids. Thus, ethyl acetic ester is broken up into ordinary acetic acid and ethyl alcohol according to the following equation:

Alkalies have the same effect on esters, but much more pronounced. Thus, potassium hydroxide (caustic potash) decomposes ethyl acetic ester as follows:

Esterification and Saponification. The conversion of an acid into an ester is termed *esterification*. The decomposition of an ester into its constituents is sometimes termed *saponification* (the reason for using this term is stated in the article FATS). When the saponification of an ester is effected by water alone, or with the aid of acids, but not of metallic hydroxides, the ester is said to be "hydrolyzed."

The processes of esterification and saponification have furnished a considerable portion of the material upon which certain very important theories of modern chemistry have been tested and verified. The theories themselves are explained in some detail in the article REACTION, CHEMICAL. A brief account of their bearing on the processes of esterification and saponification may, however, not be out of place in the present sketch.

It was stated above that ethyl acetic ester may be formed by the action of ethyl alcohol upon acetic acid. This reaction takes place according to the following equation:

The reaction evidently involves the simultaneous formation of water and of ethyl acetic ester.

On the other hand, it was also stated above that water decomposes ethyl acetic ester into its components. Therefore, even while the ester is being formed from its components, it is broken up again by the action of the water formed along with it. In other words, two opposite reactions take place simultaneously, one being a process of esterification, the other a process of saponification. If the two processes took place with equal rapidity from the very beginning, neither could evidently make any progress; so that, whether we should mix alcohol and acetic acid, or water and ethyl acetic ester, no change at all would ensue. In reality, however, this is not the case, one of the reasons being as follows: All chemical reactions take place according to the law of mass action. By this law, the rapidity with which two given substances react with each other at a given temperature is proportional to the amounts of those substances contained in unit volume. The greater the amounts present, the more rapid the reaction. When alcohol and acetic acid are mixed together, a reaction starts in with considerable rapidity. During the reaction both substances gradually disappear as such. Their amounts present in every unit of volume, therefore, gradually diminish, and hence the reaction (i.e., the esterification) becomes gradually slower and slower. On the other hand, since the reaction produces ester and water, the amounts of these gradually increase, and hence the reaction between them (i.e., the saponification) gradually becomes more and more rapid. The velocities with which the two opposite reactions take place, therefore, tend to become equal, and when this "equilibrium" is finally reached the composition of the mixture ceases to change. Not that all reaction has then entirely ceased. Both of the opposite reactions undoubtedly continue to take place as before. Only for every amount esterified, an exactly equivalent amount is now saponified, and hence no change can be observed. In other words, a "dynamic" (not a "static") equilibrium is established in the mixture, which is now composed of four substances—acid, alcohol, ester, and water. This equilibrium can be reached in two ways: (1) by starting with a mixture of alcohol and acid, or (2) by starting with a mixture of ester and water. Thus, when 46 grams of alcohol are mixed with 60 grams of acetic acid (46 and 60 are the relative reacting weights of alcohol and acetic acid), a process of esterification ensues, and continues until the composition of the mixture becomes as follows: 15½ grams of alcohol, 20 grams of acetic acid, 58½ grams of ethyl acetic ester, and 12 grams of water. In this mixture no further change can take place. But a mixture of precisely the same composition is finally obtained if, to start with, 88 grams of ethyl acetic ester and 18 grams of water (88 and 18 are the relative reacting weights of the ester and of water) have been allowed to react upon each other.

All this holds good, of course, only in case none of the products of the reaction is eliminated. For if, e.g., we were to remove the water produced by the esterification, the counteracting process (i.e., the saponification) could not take place, and hence the esterification would proceed unchecked until all the alcohol and acid had combined. As a matter of fact, this is the case when some dehydrating agent (such as sulphuric acid, zinc chloride, etc.) is added to a

mixture of alcohol and acid, the esterification being then practically complete.

The saponifying action of bases has long been comparatively well understood, at least in a formal, mathematically descriptive way; it is explained by the law of mass action already mentioned in this sketch, with the aid of the theory of electrolytic dissociation. (See DISSOCIATION.) The saponifying action of a base is due to its electro-negative hydroxyl ions (OH^-). Since, according to the law of mass action, the rapidity of any reaction in general depends on the amounts of the active substances contained in unit volume, the rapidity of a saponification must depend on the amount of ester and on the amount of the hydroxyl ions present in every unit of volume. The stronger the base the greater the number of hydroxyl ions in its solution, and hence the greater its saponifying power. If the base is weak (like ammonium hydroxide), its small number of hydroxyl ions is still further (and very considerably) diminished by the presence of one of its salts; hence the presence of such salts has a retarding effect on the process of saponification, especially in case the base is weak. Further, since a salt necessarily forms during the saponification (see, e.g., the equation representing, above, the saponification of ethyl acetic ester by caustic potash), the rate of saponification must be diminished not only by the disappearance of the ester and base as such, but also by the formation of the salt and free alcohol, the products of the reaction. The mathematical application of these principles leads to a method of calculating the rapidity with which a saponification may take place, if the amounts of ester and base and the strength of the latter are given. The results thus obtained on a purely theoretical basis have, in a large number of cases, been verified by actual experiment, and the agreement of the theoretical and experimental figures has been found good throughout.

The hastening (see CATALYSIS) of esterification and of ester hydrolysis by acids has been the subject of numerous investigations; but its mechanism is not yet clearly understood. The "stronger" a given acid is found to be when examined with regard to its power of conducting the electric current in aqueous solution, the greater is also found to be its catalytic effect upon the formation and hydrolysis of esters. From this it has been concluded that it is not the acid as a whole, but its free hydrogen ions that hasten the reaction. But nothing is positively known as to *how* hydrogen ions can hasten a reaction. Furthermore, the intervention of other factors is indicated by the fact that the observed reaction velocity is by no means directly proportional to the number of hydrogen ions present.

The phenomena of so-called "direct esterification" (i.e., esterification as it takes place between an organic acid and an alcohol in the absence of a strong foreign catalyzing acid) have been closely investigated by Rosanoff with several collaborators. Here, too, the reaction is catalyzed, but the catalytic agent is the esterifying acid itself; the absence of a foreign catalyzer simplifies the problem and permits of gaining deeper insight into the mechanism of the reaction. The acid principally employed in these studies was benzoic acid, which was esterified with ethyl alcohol, the reacting mix-

ture being dissolved in acetone and kept for definite periods of time, in sealed tubelets, at the temperature of boiling aniline (183°C). The results have shown that under these conditions *three* molecules take part in the reaction: *two* of the acid and *one* of alcohol. Previous to these investigations it was generally believed that the reaction proper takes place between *one* molecule of alcohol and *one* molecule of acid, as would be indicated by the ordinary chemical equation:

The true equation is:

The "catalyzing" part of the acid thus takes part in the reaction as well as the "esterifying" part, as is shown by the fact that the two parts obey the law of mass action equally well. (See CATALYSIS.) Moreover, Rosanoff and his collaborators have succeeded in showing that the three reacting molecules first form one triple molecule, which subsequently breaks down with formation of single molecules of ester, water, and acid (the three substances shown to the *right* of the equality sign in the last equation above). But the same triple molecule can also be formed by the union of single molecules of ester, water, and acid, and it can also break down into two molecules of acid and one molecule of alcohol (the substances formulated to the *left* of the equality sign in the true equation of the process). Accordingly the reaction takes place in two stages: in the first the triple molecule is formed, in the second it is decomposed; and it is reversible because the intermediate triple molecule can both be formed from, and decomposed into, the two sets of single molecules involved, so that the same state of equilibrium must ultimately be produced whether we start with two molecules of benzoic acid and one of alcohol, or with single molecules of ester, water, and acid.

All the known facts in the case, which space does not permit of discussing in the present article, point to the following formula as representing the structure of the intermediate triple molecule:

The dotted lines here denote *half* valencies, whose rupture constitutes the last stage of the reaction (i.e., the stage following the formation of the complex molecule itself). However, this structural formula, while interesting as a faithful summary of a variety of facts, is nevertheless hypothetical, as such formulæ must remain in the present state of chemical science.

ES/TES, DANA (1840-1909). An American publisher, born at Gorham, Me., and educated in the public schools. He worked several years as a clerk, and served in the Federal army in the Civil War until disabled by wounds. He became a member of the publishing firm of

Degen, Estes & Co., subsequently was with Lee and Shepard, and in 1872 became a partner in the house of Estes and Lauriat. This latter firm was succeeded in 1898 by Dana Estes & Co. As a traveler, Estes was the first American to explore the Nile country to Uganda, and the Congo Free State. He also organized and was first secretary of the International Copyright Association. He compiled *Chimes for Childhood* (1868) and *Spectrum Analysis Explained* (1872) and edited *Half-Hour Recreations in Popular Science* (1874; 2d ed., 1879).

ESTEVAN, ɛs'tɛ-vān. A town in Assiniboia District, Saskatchewan, Canada, on the Souris River, and on the Canadian Pacific Railway, 145 miles southeast (direct) of Moosejaw and about 295 miles southwest (direct) of Winnipeg (Map: Saskatchewan, H 8). Among the manufacturing industries are lumber and brick yards and flour mills. There are grain elevators and implement-distributing warehouses, and a government coal-testing plant. The town is an important shipping centre for coal and brick. There is a municipal electric-light plant. Pop., 1901, 181; 1911, 1981; 1914 (local est.), 4000.

ESTHER, ɛs'tɛr (Heb. *Esther*; cf. Babylonian *Ishtar*, and late Bab. *Ēstrā*), or **HADASSAH** (Heb., myrtle). A biblical character who has given her name to the Book of Esther, which forms part of the collection of the Old Testament. According to this book, Esther is a Jewess of the tribe of Benjamin. She is represented as the daughter of Abihail, orphaned in early life, and brought up by her cousin Mordecai (Esther ii. 7, 15) in Susa, the Persian capital (ii. 5). When the King of Persia, Ahasuerus (Xerxes, 485-465 B.C.), angered at the refusal of his Queen, Vashti, to unveil herself publicly at a banquet, desired a new queen (i-ii. 4), Esther was brought to the palace and was chosen in Vashti's place (ii. 8-20). As Queen, she accomplished that for which she has since been famous—the deliverance of her nation from the cruelty of Haman, the King's vizier, and also brought about the overthrow of Haman himself (iii-ix). In commemoration of this deliverance the Jews celebrate the Feast of Purim. See **PURIM**.

There are several difficulties involved in supposing Esther to have actually been the Queen of Xerxes. Herodotus mentions Amestris as the only Queen of Xerxes, and what we know of her does not at all agree with the story of Esther. Moreover, the Persian kings chose their wives from the principal Persian families or from the daughters of foreign potentates. Hence it has been supposed that Esther was in reality merely the favorite of the King's harem. But even this is unlikely; and many scholars now hold that she is an entirely mythical character, identical with *Ishtar*, the Babylonian goddess. See **ESTHER**, **BOOK OF**.

ESTHER. 1. A drama by Racine, written at the suggestion of Madame de Maintenon, and founded on the life of the Old Testament personage of the same name. It was written for the pupils of Saint-Cyr, and was performed by them before Louis XIV in 1689. 2. An oratorio, the words by Humphreys, based on Racine's play, and the music by Handel. Its first performance took place in 1720.

ESTHER, **BOOK OF**. One of the very latest of the canonical books of the Old Testament, belonging to the third division of the collection known as the *Hagiographa*. It contains the

story of the deliverance of the Jews of Persia from a destruction planned for them by Haman, the Grand Vizier of Ahasuerus (Xerxes, 485-465 B.C.). The heroine of the book is a Jewess whose original name is Hadassah, but who appears as Esther. The scene is laid at the court of Ahasuerus, in Susa. The King, who has deposed his Queen, Vashti, for refusing to obey his orders that she show her beauty to the revelers at the King's banquet, gives direction to seek for a beautiful woman to take Vashti's place. Esther, a Jewess, is selected as the fairest of maidens and meets with the favor of the King. She is the cousin of Mordecai, a Jew of the tribe of Benjamin, by whom she has been brought up; but shortly after Esther's elevation a great disaster threatens her people through the refusal of Mordecai to pay homage to Haman, the Grand Vizier, and who is a descendant of Agag, King of Amalek (1 Sam. xv). Haman in great anger proceeds to Ahasuerus and, accusing all the Jewish subjects of disloyalty, offers to put 10,000 talents of silver into the royal treasury as the proceeds of the permission to pillage the Jews. The King consents and issues an edict for the extermination of the Jews and the confiscation of their property. At this moment Esther, urged on by Mordecai, intervenes. Uninvited, she enters the presence of the King to intercede on behalf of her people. The King receives her graciously and accepts her invitation to dine with her on two consecutive nights. On the night preceding the second banquet, at which Esther intended to make known her request, the King learns from the royal archives of the services rendered by Mordecai in discovering a conspiracy against Ahasuerus' life, for which he had never been rewarded. Haman, too, comes to the banquet, and the King, having in mind Mordecai, asks Haman what should be done with the man whom the King delighteth to honor. Haman replies, and endures the humility of himself leading Mordecai in triumph through the streets. At the second banquet Esther discloses her nationality and exposes the designs of Haman, who is seized and ordered to be executed on a gallows which he had prepared for Mordecai. The latter is raised to the vacant post of honor, and the Jews are given permission to defend themselves against the carrying out of the order for their extermination, which, in accordance with the customs of the Medes and Persians, could not be revoked. A great dread falls upon the people, and on the day set for the extermination of the Jews the latter slay 500 men in Susa, and 75,000 of their enemies in the Persian Empire. Esther then makes a further request that the Jews be permitted to slay their enemies in Susa the following day, and this is granted, 300 more being killed on the 14th of Adar. In commemoration of the deliverance the Feast of Purim was instituted.

The Book of Esther, as is now generally recognized by scholars, is a romance, which may, however, contain an historical kernel, being based on some persecution endured by the Jews of Susa. Mordecai and Haman, as descendants of Benjamin and Agag, typify the old feud between Hebrews and Amalekites. It is also probable that a Babylonian legend or myth has guided the author of the book in some of the situations of the dramatic tale. Mordecai is a derivative of Marduk, the chief god of Babylonia; Esther is a form of the Babylonian goddess *Ishtar*; while Haman and Vashti are names analogous

to those borne by Elamitic deities. The story thus represents the conflict between Babylonian and Elamitic gods. The Feast of Purim also presents analogies to the Babylonian New Year's Festival.

The language of the book, as well as the circumstance that the Persian Empire is treated as a thing of the past, favor a late date for the composition. It was probably written in the second century B.C. The Greek translation was introduced in Egypt in the fourth year of Ptolemy and Cleopatra, probably 114 B.C.; and as its purpose was to urge the Egyptian Jews to observe the Purim festival, the book is not likely to have been written long before this date. It seems to have been written originally as a plea for the general observance of a festival which appears at one time to have been limited to the Jews of Babylonia and Persia. See PURIM.

Consult, besides the commentaries on the Book of Esther by Wildeboer (Freiburg, 1898), Siegfried (Göttingen, 1901), Paton (New York, 1908), the introductions to the Old Testament (see EXEGESIS), and the articles of Toy, "Esther as a Babylonian Goddess," in *The New World*, vol. vi (Boston, 1897); Zimmern, in *Zeitschrift für Alttestamentliche Wissenschaft*, vol. x (Gießen, 1891); Jensen, in *Wiener Zeitschrift für die Kunde des Morgenlandes*, vol. vi (Vienna, 1892); Erbt, *Die Purimsage in der Bibel* (Berlin, 1900); Paul Haupt, in *Beiträge zur Assyriologie* (Leipzig, 1906), and in *American Journal of Semitic Languages and Literatures* (Chicago, 1908).

ESTHER, DEUTEROCANONICAL FRAGMENTS IN BOOK OF. In the Greek translations of the Book of Esther there are seven somewhat extensive passages not found in the Hebrew text. They are regarded by many Roman Catholic scholars as parts of the original text which were removed from the Hebrew, perhaps in order that the name of God—used in these passages, but not in the rest of the book—might not be dishonored when the roll was read during the rather secular festival of Purim. Most Protestant scholars regard them as interpolations, intended to supplement and amplify the story, which became a favorite with the Jews. The late Greek origin of these additions seems to be indicated by such a detail as the representation of Haman as a Macedonian who attempted to transfer the sovereignty from the Persians to the Macedonians, and by the contradictions between them and the Hebrew text. These additions, which are therefore supposed to be the work of Hellenistic writers, were all put by Jerome, in his Latin translation of the Bible, at the end of the book, together with notes to show where other additions to the Hebrew occur in the Greek. This relegation of the additions to an appendix was unfortunate, as it obscured the relation to the chapters in which they were originally inserted. In English versions they are embodied in the Apocrypha under the title "The Rest of the Chapters of the Book of Esther." They consist of (1) Mordecai's dream and the conspiracy of the two eunuchs (precedes Esther i. 1); (2) the King's edict commanding the destruction of the Jews (follows iii. 13); (3) Mordecai's exhortation of Esther (follows iv. 8); (4) prayer of Mordecai and prayer of Esther (follows iv. 17); (5) Esther's appearance before the King (amplification of v. 1, 2); (6) the King's second edict, in favor of the Jews (follows viii. 12); (7) interpretation of Mordecai's dream (follows x. 3). They are

supposed by many scholars to have been written in the first century B.C. In the Aramaic paraphrases of Esther, of which there are two, known as the first and second Targums to Esther, there are similar embellishments, independent of the Greek additions. See DEUTEROCANONICAL BOOKS. ESTHER, QUEEN. An Indian Chieftainess. See MONTOUR.

ESTHERIA (Neo-Lat., anagram of St. Theresa). A bivalve phyllopod crustacean of the order Branchiopoda, found in a fossil state in deposits of fresh and brackish water origin, from the Devonian to the Pleistocene. The animal is not well segmented and is able to withdraw itself wholly within its shell. (For its anatomical characters, see the articles on CRUSTACEA and PHYLLOPODA.) The shell varies in size from $\frac{1}{8}$ to 1 inch in length and is of rounded, flattened form, with moderately prominent beaks near the hinge line. In texture it is thin and membranaceous, and the surface is usually marked by concentric folds or imbricating ridges between which are trellised or anastomosing lines. This latter character serves to distinguish Estheria shells from the shells of small pelecypods such as Posidonomya. One species (*Estheria membranacea*) is found in the Old Red Sandstone of the British Devonian, in equivalent beds of Germany, and in the contemporaneous formations of the Oneonta-Catskill group of New York State. About 24 living species of *Estheria*, and about an equal number of fossil species, are known from widely distributed regions. Allied genera are *Limnadia* and *Limnetis*, each represented by a few species, and the fossil genus *Leaia*, found in the Carboniferous and Permian formations, which differs from *Estheria* in the presence of diagonal ridges that run from the umbones to the ventral margins of the shell.

Consult: Jones, "A Monograph of the Fossil Estheriæ," *Monographs of the Palaeontographical Society* (London, 1862); "On Fossil Estheriæ and their Distribution," *Quarterly Journal of the Geological Society of London*, vol. xix (ib., 1863). See also CRUSTACEA; PHYLLOPODA; and, for illustration, see PLATE of PHYLLOPODA.

ESTHERVILLE, ɛs'tər-vīl. A city and the county seat of Emmet Co., Iowa, about 140 miles (direct) northwest of Des Moines, on the Des Moines River, and on the Chicago, Rock Island and Pacific and the Minneapolis and St. Louis railroads (Map: Iowa, C 1). The city contains a Carnegie library and a fine high-school building. It is situated in an agricultural and stock-raising district and has grain elevators, flouring mills, railroad machine shops, creameries, a tub factory, cement-products works,

musical instrument and cigar factories, etc. The wholesale interests are considerable. The water works and electric-light plant are owned by the municipality. Pop., 1900, 3237; 1910, 3404.

ESTHONIA (Esthonian *Esti-ma*, Esthland). A province of the old Russian Empire which became an independent state on Feb. 2, 1920. Besides the old province of Esthonia it includes the northern part of Livonia, the islands of Moon Sound, and a small part of the government of Petrograd. The estimated area is about 20,000 square miles, and the population 1,600,000, of which more than 90 per cent are Esthonian. The language is Esthonian, but German and Russian are generally spoken and understood. A great majority of the people are Lutherans. Elementary education is compulsory. The University of Dorpat is now under Esthonian auspices. Reval is the chief seaport and capital.

The chief occupation of the people is agriculture. In 1919 a movement was begun to divide up the large estates. The chief crops are rye, oats, barley, and potatoes. In 1920 the yield of potatoes was 21,232,005 bushels, oats 5,319,471, winter rye, 3,788,955, and barley 2,514,555. In the same year there were 155,489 horses, 414,955 cattle, 497,838 sheep, and 244,912 pigs. The live stock decreased largely during the war.

The chief industries are textiles, shipbuilding, metal works, mining, and chemicals. During and after the war (1914-18) the industries almost came to a standstill largely because of inability to get raw materials. Before the war 50,000 people were employed in industry, but after it less than one-fifth that number.

In 1920 the exports amounted to \$17,544,278 and the imports to \$19,931,218. The chief exports were flax, paper, spirits, and timber. The chief imports were coal, fertilizers, fish, salt, and petroleum. The budget expenditures proposed for 1922 were 5,500,000,000 marks. After the war the finances were in a deplorable state. The Esthonian mark greatly depreciated.

The form of government was provided by the constitution which went into effect Dec. 20, 1920. The executive power is vested in a state head and a ministry chosen by the assembly, and the legislative power in an assembly of 100 members elected for three years by universal, direct, equal and secret suffrage, on the basis of proportional representation.

History. After the Russian Revolution in 1917, Esthonia claimed its independence. It was recognized by Great Britain on Feb. 4, 1918. Subsequently other nations recognized it. France and the United States refused to do so on the grounds that it was a part of the old Russian Empire. The Bolsheviks recognized its independence on Feb. 2, 1920. See **RUSSIA** and **VOLUME XXIV**.

ESTHS. See **ESTHONIA**.

ESTIENNE, *ä'tyén'*. See **STEPHANUS**.

ESTIVAL. See **ÆSTIVAL**.

ESTIVATION. See **HIBERNATION** and **ESTIVATION**.

ESTLANDER, *ést'länd-är*, **CARL GUSTAF** (1834-1910). A Finnish writer on art history. He was appointed professor of aesthetics at the University of Helsingfors in 1868. He founded and became editor of the *Finland Review* in 1876 and wrote a number of valuable works which have contributed to the industrial and artistic progress of his country. Among his works are: *The History of the Plastic Arts from the Middle of the Eighteenth Century until our own Time*

(1867); *The Development Past and Future of the Art and Industry of Finland* (1871); *Richard Cœur de Lion in History and Poetry* (1858); *The Robin Hood Ballads* (1889); and some researches into the romance of Tristan, in French (1866).

ESTOC (OF., from OHG., MHG. *stoc*, Ger. *Stock*, Eng. *stock*). A small dagger worn at the girdle and called in Elizabethan times a "tuckler."

ESTOILE, *ès-toil* or *ès-twäl'* (OF., star), or **STAR**. A bearing in heraldry. It differs from the mullet (q.v.) in having six waved rays, the mullet consisting of five plain ones.

ES'TON. A town in the North Riding of Yorkshire, England, about 4 miles east-southeast of Middlesbrough. Its chief industry is the manufacture of steel rails. Pop., 1901, 11,200; 1911, 12,026.

ESTOPPEL (from *estop*, from OF. *estoper*, *estouper*, Fr. *étouper*, from ML. *stoppare*, Lat. *stuppeare*, *stupare*, to stuff with tow, cram, from *stuppe*, *stupa*, (Gk. *στύπη*, *stýppē*, *στύπη*, *stýpē*, oakum). A legal impediment or bar which precludes a person from alleging or denying a fact because of his previous conduct. Estoppels are divided into three classes, which will be considered separately:

1. **By Record.** This class includes not only the formal and final judgment in a judicial proceeding, but the pleadings of the parties and all other papers or orders which go to make up the record of the case. If any mistake has been made in the record, the party injuriously affected by it must obtain relief by an application to the court to correct it or by an appeal to a higher court. When the record is allowed to stand, it is conclusive evidence of its truth. If the judgment is one in rem, i.e., if it is an adjudication as to the status of a person or thing, it is conclusive against the whole world. Every one is estopped from setting up the truth at variance with the judgment. If A is duly adjudged a bankrupt, no one is allowed, while such judgment stands, to dispute his condition of bankruptcy. If the judgment is in personam as a judgment for a sum of money, it is conclusive upon the parties, but not upon strangers.

2. **By Deed.** Where a person has entered into a solemn engagement by deed, i.e., by written instrument under seal, he is not allowed, while the deed remains unimpeached, to deny the truth of any assertion which he has made therein. If the grantor of land recites in his deed that he is the owner of it, he will be precluded from showing that he was not.

3. **In Pais, or by Conduct.** At present, this is by far the most extensive of the three classes of estoppel, although in Lord Coke's time it was limited to estates in land acquired by livery of seisin, by entry, by acceptance of rent, and by acceptance of an estate.

Estoppels by record and estoppels by deed are often spoken of as "odious," because, being of a technical character, they operate harshly at times. Estoppels in pais do not rest upon considerations of general policy, such as have led to the establishment of the other classes, but upon the doctrine that where one by his conduct causes another to believe the existence of a certain state of things, and induces him to act on that belief so as to alter his previous position, the former is precluded from averring, as against the latter, that a different state of things existed at the time in question. These estoppels are treated with favor by the courts,

and their scope is increasing constantly. They are known also as "equitable estoppels" and have their foundation in fraud. But while the conduct which produces an estoppel in pais is generally fraudulent, it is not always nor necessarily of that character. An example is afforded by one who withdraws from a partnership. He must give notice of his withdrawal or he will be estopped from showing that he has ceased to be a member as against one who has become creditor of the firm upon the assumption that he was still a member. Nor will it be any defense that his former partner agreed to give the proper notice of dissolution. It is his duty to be active in the matter; to see that such notice is given as will in the ordinary course of business protect third persons from trusting the firm on the assumption that he is still a partner.

The modern American doctrine of *title by estoppel* has more in common with the estoppel in pais than with that by deed. It arises where an interest in land is purported to be conveyed by deed and the deed contains a covenant of warranty or equivalent covenant of title. Such a deed, though made by one having no estate to convey, vests the title by anticipation in the grantee, which becomes a valid and effectual title if at any time thereafter the land should come to the grantor, no further conveyance being necessary to divest the title of the grantor or to confirm that of the grantee. (See FEOFFMENT; WARRANTY.) Consult: Blackstone, *Commentaries* (London, 1886); Bigelow, *Treatise on the Law of Estoppel* (5th ed., Boston, 1890); Ewart, *An Exposition of the Principles of Estoppel by Misrepresentation* (Toronto, 1900); Black, *Treatise on the Law of Judgments including the Doctrine of Res Adjudicata* (2 ed., St. Paul, 1902).

ESTOURNELLES (ès'tour'nèl') **DE CONSTANT**, PAUL HENRI BENJAMIN, BARON D' (1852-). A French publicist, born in La Flèche, Sarthe. He was a grandnephew of Benjamin Constant and was educated at the Lycée Louis-le-Grand, Paris, and at the School of Oriental Languages. He entered the diplomatic service, was secretary of the commission for the delimitation of Montenegro, and later was chargé d'affaires in Montenegro, and, after service in Tunis, at The Hague and (1890-95) in London. He was a deputy from Sarthe in 1895-1904 and then was elected senator. An ardent advocate of international peace, he was a member of The Hague conferences and of The Hague Court, and did much to calm and check angry feeling between France and Germany. He received the Nobel prize for peace in 1909. He wrote for French, English, and American reviews; published a volume on modern Greece and translations from modern Greek drama; reports of The Hague conferences; papers for the Inter-parliamentary Union and the Universal Races conference; a volume on aviation; *Les congrégations religieuses chez les Arabes* (1887); *La politique française en Tunisie* (1891, winning the Prix Théroutanne); and *Les États Unis d'Amérique* (1913), based on his visits to the United States in 1902, 1907, 1911, and (for the Champlain Celebration) in 1912.

ESTOVER (OF. *estover*, *estouvier*, need, necessity, from *estorer*, *estuvoi*, to furnish). An ancient term of the common law, used originally of any necessary supplies to which a person was entitled out of the estate of another, but now limited to the right of a tenant to take neces-

sary firewood and wood for repairs from the demised premises. In the former sense it was once employed to describe the alimony, or sustenance, to which a woman divorced from her husband *a mensa et thoro* was entitled. In the latter sense it is by English writers more frequently known by the Anglo-Saxon term *bote*, as house bote, a right of wood for fuel and the repair of the house; plow bote, wood for plows and carts; and hay bote, wood for repairing hedges and fences. The right of estover is an incident of the usual forms of subordinate tenancy—for life, for years, from year to year, and at will—and is fully recognized in the United States as well as in England. See LANDLORD AND TENANT; and cf. WASTE.

ESTRADA, ès-trà'dà, LA. A town in the Province of Pontevedra, Spain, 15 miles south by east of Santiago de Compostela on the Río Ulla. It is situated in a populous mountain region and is engaged in farming and stock raising, lumbering, and the manufacture of woolen and linen goods. There are mineral springs here. Pop., 1900 (commune), 26,838; 1910, 27,898.

ESTRADA CABRERA, às-trà'dà kà-brà'rà, MANUEL (1857-). A Central American politician, and a president of Guatemala, born at Quezaltenango. After completing his studies in philosophy and law, he devoted himself to legal practice, rising to be a district judge, and a justice of the Supreme Court; and in 1885 he actively entered politics as a representative in the National Assembly. In 1892 he was appointed Secretary of State; in February, 1898, upon the assassination of President Barrios, he became acting executive; in September of that year he was elected President; and he was re-elected for the term 1905-11. He consistently advocated important measures for the progress of the country: the putting of the currency on a sound basis; the aiding of public works, especially in agricultural and industrial lines; the expansion of the budget for public instruction; in short, anything that would aid the cultural development of the country. Despite all this, he gained bitter enemies, and several attempts were made on his life. In March, 1911, he was again re-elected for the term 1911-17.

ESTRADES, ès'trà'd, GONFROIR, COMTE D' (1007-86). A French soldier, born at Agén. He was a page of Louis XIII, went on a mission to Holland in 1646, became colonel of infantry, and *maréchal de camp* in 1647. In 1661 he was made Ambassador Extraordinary to England, and conducted the negotiations on the cession of Dunkirk to the French. He was Ambassador to Holland in 1646-68, and then in the campaign that followed received the baton of marshal (1675) for gallantry at Wesel, Maestricht, and Liège. He represented his country in the congress that arranged the Peace of Nymwegen (1678). *Lettres, mémoires et négociations* (9 vols., Paris, 1758; and a supplementary vol. in London, 1763) were published posthumously. Consult Philippe Lauzun, *Le Maréchal d'Estrades* (Agén, 1896).

ESTRAY (OF. *estrayer*, *estraier*, to stray, from *estree*, *stree*, Prov. *estrade*, street, from Lat. *strata*, street, from *sternere*, to strow; according to another etymology from ML. *extravagari*, to wander beyond, from Lat. *extra*, beyond + *vagari*, to wander). Any animal, the subject of property and not *feræ naturæ*, or wild, which is found without apparent owner at large in a pub-

lie place or on the land of any one not the owner. If trespassing on private land, an estray may, in England and generally in the United States, be impounded at the cost of the owner reclaiming it, and in some jurisdictions may be distrained *damage feasant*. In England, if found within the limits of the royal demesnes or of a manor where it does not belong, an estray becomes subject to the lordship of the King or lord of the manor, who acquires a qualified property therein. This right of property becomes absolute if the animal be not reclaimed by the owner within a year and a day after due proclamation made by the lord of the manor. This doctrine is a peculiar exception to the general rule of law, which protects the title of the loser of goods until his claim becomes barred by the Statute of Limitations. It does not obtain in the United States, where the status of estrays and the rights of their owners are for the most part regulated by statute. In some States the finder of a strayed animal may, after a reasonable time and due advertisement, sell it at public or private sale and pass a good title to the purchaser. The proceeds of the sale, after paying the reasonable charges of the vendor, are usually paid into the treasury of the town, county, or State. Consult Burn, *Justice of the Peace and Parish Officer* (30th ed., London, 1899), and Scriven, *Treatise on Copyhold, Customary Freehold, etc.* (ib.).

ESTREAT' (OF. *estret*, *estrait*, Fr. *extrait*, extract, from OF. *extraire*, Fr. *extraire*, to draw out, from Lat. *extrahere*, to draw out, from *ex*, out + *trahere*, to draw). In English law, a true extract, copy, or note of some original writing or record, and specially of fines or amercements, as entered in the rolls of a court, to be levied by bailiffs or other officers. When applied to a recognizance (q.v.), it signifies that the recognizance itself is estreated, or taken out from among the other records, and sent to the exchequer for enforcement. If the condition of a recognizance be broken, the recognizance is forfeited; and on its being estreated the parties become debtors to the crown for the sums in which they are bound. Under the present practice in England the King's Remembrancer issues process for the enforcement of estreats, subject to the supervisory power of the King's Bench Division of the High Court of Justice.

ESTRÉES, á'strá', GABRIELLE D' (c.1573-99). The favorite of Henry IV of France. She was the daughter of Marquis Antoine d'Estrées, Governor of the Isle de France. In her father's absence she received Henry IV at her father's castle at Cœuvres in 1590 and inspired him with a violent passion. To avoid scandal, her father forced her to marry M. d'Amerval de Liancourt, but Henry had the marriage dissolved and summoned her to court. She bore Henry several children and was created by him Marchioness of Monceaux and Duchess of Beaufort. Her amiable and sweet disposition endeared her to all. She was shown every mark of favor by the King, was given many rich presents, a splendid domain, and a great income. So great was his infatuation that he stood ready to divorce his wife Marguerite de Valois and to marry Gabrielle, and it was only her sudden death in 1599 that prevented the step. Consult Desclozeaux, *Gabrielle d'Estrées* (Paris, 1889), and Loiseleur, *Questions historiques du XVII^e siècle*.

ESTRELLA DE SEVILLA, á-strá'lyá dâ sâ-vê'lyá, LA. A comedy by Lope de Vega, abound-

ing in strong situations, and considered by many to be Lope's masterpiece.

ESTREMADURA, ês'trâ-mâ-dôô'râ. A province of Portugal bounded by Beira on the north, by Alemtejo on the east and south, and by the Atlantic Ocean on the west (Map: Portugal, A 3). Area, 6711 square miles. The surface is generally mountainous except in the south. The chief river is the Tagus, which divides the province into two parts. The climate is temperate and healthful; earthquakes occasionally occur. There are extensive forests, and the soil in certain sections yields good crops of grain and fruit. The population is sparse, and the province is in a generally backward condition. For administrative purposes Estremadura is divided into the three districts of Lisbon, Leiria, and Santarem. Pop., 1890, 1,083,290; 1900, 1,231,418; 1911, 1,438,726.

ESTREMADURA, ês'trâ-mâ-dôô'râ. 'An old province of Spain, situated in the southwestern part of the country, and bounded on the north by León, on the south by Andalusia, on the west by Portugal, and on the east by New Castile (Map: Spain, B 3). It is divided into the two provinces of Badajoz and Cáceres. Area, 16,162 square miles. Although a continuation of the high table-land of New Castile, Estremadura differs somewhat in the formation of its surface. Its northern part is occupied by the lofty and well-wooded Sierra de Gredos and Sierra de Gata. The Sierra de Guadalupe forms the watershed between the Tagus and Guadiana, the chief rivers of Estremadura. It is less elevated and has a sandy soil. South of the Guadiana the country becomes more sterile and contains little agricultural land. But even in the fertile portion of Upper Estremadura agriculture is in a state of neglect, more attention being paid to the breeding of domestic animals. Estremeño pork, bacon, and hams vie in celebrity and flavor with those of Westphalia. Copper, lead, silver, and coal are found, but are only slightly exploited. The chief articles of commerce are animal products, which are largely smuggled into Portugal. Pop., 1887, 821,300; 1897, 853,438; 1900, 882,410; 1910, 990,990. The inhabitants are poor and illiterate and from want of roads are isolated from the rest of Spain. They make excellent soldiers, however, having produced a series of *conquistadores* and generals, e.g., Cortés and Pizarro, to mention only the two who were most celebrated.

ESTREMOZ, ês'trâ-mô's'. A town in the Province of Alemtejo, Portugal, situated about 32 miles by rail northeast of Evora (Map: Portugal, B 3). It is built at an altitude of over 1500 feet and is defended by two half-ruined forts. Estremoz is famous for its earthenware of porous clay, which is in use all over the peninsula. In the neighborhood is quarried marble of different colors, and the town exports fine wool. Pop., 1890, 7107; 1900, 7857.

ESTREPEMENT (OF. *estrepement*, from *estreper*, to waste, from Lat. *extirpare*, to uproot, from *ex*, out + *stirps*, trunk of a tree). 1. Waste or spoliation of lands, committed by a tenant for life or years. Used in this sense, the term has become obsolete, having been supplanted by the term "waste" (q.v.). 2. An ancient writ or process of the common law instituted to restrain or prevent the commission of waste. With the development of the jurisdiction of courts of equity in the prevention of waste, the common-law remedy has become

obsolete. In Pennsylvania, where there are no courts of equity, the writ of *estrepement* is still in use for the purpose of preventing waste.

ESTRUP, JACOB BRÖNNUM (1825-1913). A Danish statesman, born at Sorø. He took his seat in the Landsting in 1864, was leader of the Agrarians, and active in the revision of the constitution in 1866. As Minister of the Interior in 1865-69, he furthered the railway service of the kingdom. In 1875 he became President of the Council and Minister of Finance. He was continually involved in difficulties with the Folkething, which disapproved the conservative policy of strengthening the defenses of Copenhagen. Estrup made use of the royal power of issuing provisional acts, even finance acts after 1877, and from 1885 to 1894 carried on the government by a provisional budget. His resignation in 1894 marked the transfer of power from the crown and the Landsting to the Folkething. He opposed the sale of the Danish West Indies in 1902, but afterward had little influence except with a small part of the Right; and in 1908 his opposition to the electoral and tax reforms was unsuccessful.

ESTUARY (from Lat. *æstuarium*, estuary, from *æstus*, tide). The widened channel at the mouth of a river, in which there is marked tidal action. An estuary is usually formed by submergence or "drowning" of the river valley, which then is subjected to the erosive action of tides and waves. The channels of estuaries are generally shoal and are obstructed by shifting bars. During the flow of the tide the sand and mud brought down by the river is carried up the estuary and partially deposited, while a portion is borne down again by the ebb. This continual oscillation of sediment is evidenced by the turbidity of the waters. In many estuaries the tides rise very rapidly, advancing against the river current in the form of a huge wave, a phenomenon commonly called "bore" (q.v.). Good examples of estuaries are found at the mouth of the Delaware, St. Lawrence, La Plata; the Thames and Severn in England; the Elbe in Germany; and the Gironde in France. See RIVER.

ESZÉK, észák (Ger. *Esseg*, Croat. *Osijek*). A royal free city of Croatia-Slavonia, Kingdom of Hungary, the chief industrial and commercial centre of Slavonia, capital of the County of Virovitica (Map: Hungary, F 4). It is situated on the Drave, which is navigable to the Danube. The city consists of the fortress, the upper town, the lower town, and the new town. Its chief public edifices are the residence of the commandant of the fort, the town hall, the county building, a Capuchin and a Franciscan monastery, and the casino with theatre. It has a gymnasium and two teachers' colleges. The manufactures include notably flour, leather, silk goods, and glassware. It has a large river trade in grain, meat, wood, oak, staves, fruit, honey. Eszék was the Mursa or Mursia of the Romans. During the Hungarian revolution the town was at first held by Count Batthyányi, but shortly capitulated to the Austrian general, Baron Treubersberg. Population, mostly Germans, 1900, 24,930; 1910, 31,388.

ESZTERGOM, észter-góm, or **GRÁN**, grán (Hung. *Esztergom*, Lat. *Strigonium*). A royal free town of Hungary and capital of the county of the same name, on the right bank of the Danube, 25 miles northwest of Budapest (Map: Hungary, F 3). It consists of the town proper,

the archiepiscopal or "water" town, and two suburbs; and is the seat of the Prince Primate of Hungary and an archbishop. The most striking building is the large cathedral (1821-56), in the Italian Renaissance style, with an imposing dome like that of St. Peter's in Rome. The church is 348 feet long, and is the most beautiful in the kingdom. The centre is arched over by a dome 230 feet high, supported by 24 pillars. The interior is adorned with fine paintings, monuments, and chapels, and contains a fine organ by Moser. There are also the church of St. Anne, the old and the new archiepiscopal palaces of the Primate; the seminary for priests, the museum, gymnasium, Catholic girls' school, the county building, and the town hall. The cathedral has a library of 113,000 volumes and many valuable manuscripts. The suburbs are attractively laid out, and have handsome residences. Agriculture is the chief industry, and wine the principal article of commerce. Iron-ware and bricks are manufactured. Several warm saline and sulphur springs afford medicinal baths. Pop., 1900, 17,909; 1910, 17,881. Esztergom, which is one of the oldest towns of Hungary, was the residence of the Hungarian Prince Gejza; and here was born his son, St. Stephen, first King of Hungary, who was converted to Christianity in 1000, and established the see of Esztergom in 1001. The town was a great commercial centre, but was destroyed by the Tatars in 1241 and never regained its former importance. Between 1543 and 1683 it was held by the Turks.

ESZTERHÁZY. See **ESTERHÁZY**.

ETA, a'tá. See **ÆTA**.

ÉTAMPES, a'tānp' (Lat. *Stampæ*). The capital of an arrondissement in the Department of Seine-et-Oise, France, 32 miles south-southwest of Paris (Map: France, N., H 4). It contains a number of churches dating from the twelfth and sixteenth centuries, the ruins of a mediæval castle, and an old town hall. It has a college, manufactures woolen fabrics, leather, machinery, and embroidery, and carries on a considerable trade in grain and garden produce. Pop. (commune), 1901, 9001; 1911, 9454.

ÉTAMPES, ANNE DE PISSELEU, DUCHESSE D'. See **ESTAMPES**.

ÉTANG DE BERRE, a'tān' de bār. A salt lagoon, or étang, on the south coast of France, situated in the Department of Bouches-du-Rhône, and communicating with the Mediterranean through the Gulf de Foz by a narrow channel, called the Passe des Martigues. It covers an area of about 80 square miles, and its depth varies from 10 to 30 feet. It has important salt works and is of strategic value.

ETAWAH, e-tā'wā. The capital of the district of the same name in the United Provinces, British India, on the left bank of the Jumna, 70 miles below Agra (Map: India, D 3). It is picturesquely situated in a well-wooded district and has some fine streets, a handsome public square, and remains of the Jama Masjid (great mosque), several ghats, or flights of stairs, down to the river for sacred ablution, a great mound, and a ruined fort. It has small manufactures of cotton cloth. It carries on an important trade in ghi, grain, cotton, and oilseed, and owes its prosperity chiefly to its position at the junction of the two roads which lead to Agra from Cawnpore and Kalpi. Pop., 1901, 42,570; 1911, 45,350.

ETCHEMIN, *Fr. pron. ach'mân'*. See **MALE-CITE**.

ETCH'ING (from *etch*, from Dutch *etsen*, from Ger. *ätzen*, to etch, from MHG. *etsen*, OHG. *ezzen*, to give to eat, from *ezan*, Ger. *essen*, Goth. *itan*, AS. *etan*, Eng. *eat*; connected with Ir. *ith*, OChurch Slav. *yani*, I eat, Lat. *edere*, Gk. *ēdeinai*, *edesthai*, Skt. *ad*, to eat). The art and the process of engraving by means of acid which eats lines in the surface. Etching may be on glass, in which case the line is hard and invariable, and this process is used chiefly by artists who seek character drawing or book illustration in which but little light and shade is desired. It may be done on zinc, which is thought to give a peculiarly rich "color"—i.e., a black and white effect of unusual brilliancy—and for this purpose it is preferred by some modern etchers of landscape subjects. Etchings are known to have been made by Albert Dürer and others on iron, and in modern times on steel, but by far the greater number of plates etched for printing are of copper.

In order that the acid may attack only the parts desired, something which resists the action of the acid must be spread over the plate at the beginning. This is called *the ground*; it is usually varnish of some kind, laid on in a coat thick enough to guarantee its uniformity, so that no small openings will allow a little of the acid to pass through and permit a dot or small blur on the surface. Many special grounds have been used, and one recommended by Hamerton is made of wax, gum mastic, and asphaltum. It is customary then to smoke the surface of this ground, but this is unessential, as its purpose is merely to aid the etcher by allowing him to see his lines as he cuts them, by the contrast of the brilliant metal against the dead black ground of the smoked varnish. The tool by which the lines are drawn may be anything with a reasonably sharp point. J. M. W. Turner used a prong of an old steel fork, which he claimed was as good a tool as any. By far the most usual form of etching needle, however, is a steel bar weighing from one to three ounces, of which the point is made sharp; sometimes both ends are sharpened to points of different fineness. It is to be noted, however, that the needle does not cut the metal at all, but merely scratches through the surface of the varnish so as to expose the metal.

The drawing once made in this manner, the plate is plunged into the acid bath, usually made with nitric acid, diluted by about its own volume of water. The action of this acid is very rapid; it eats the copper away on either side of the line drawn through the ground by the needle, and even hollows out the metal below the surface, leaving sharp, thin edges which break down with great facility. To prevent this and to keep the lines of the width desired, what is called the Dutch mordant was introduced about 1870 and strongly advocated by Hamerton and others. This mordant is composed of chlorate of potash 20 grams, hydrochloric acid 100 grams, water 180 grams. The universal testimony of practitioners is that the bath should be large and deep and contain a considerable quantity of the mordant. Before the plate is put into the mordant it should be brushed with a feather or something of the kind, to clear away from the lines little scraps of the varnish which may have collected there. When it has been laid in the bath, it must still be watched, as bubbles arise that must be removed by a feather or similar

means, because they may prevent the free access of the acid to the metal. If, now, it is desired to have a line bitten much deeper than others, it must be exposed for a greater length of time to the acid. For this purpose the process of *stopping out* is employed. The plate is withdrawn from the bath and washed. Varnish is then applied with a brush, filling up ("stopping") those lines which have been bitten sufficiently deep, while the others are once more exposed to the acid. In this way a single plate may be withdrawn several times, more and more of the lines stopped out, and those that remain bitten more deeply. It may also be necessary to rebite the whole plate, as when it is thought, or found on actual trial, that the plate is feeble in effect. For this purpose it is necessary to clean the plate thoroughly and then to put the resistant ground on the plate afresh. This must be done with great care, so as not to fill up the lines already cut by the etching, and then careful examination must be made to see that those thin and shallow lines which have received some part of the ground are cleaned before the re-varnished plate is put into the acid bath. Small parts of the plate may, however, be rebitten by the simple means of covering the rest of the plate completely with the ground.

It is not to be forgotten that the dry-point (q.v.) process affords a perfectly ready means of reinforcing the etching without the use of acid. The bur, which is thought to make the special charm of dry point, is not essential, because it can be scraped away with a burnisher so that the lines cut or deepened by the dry point may produce an effect exactly similar to the etched line, and a plate may have been worked all over with the dry point while yet the impressions taken from it do not betray the fact.

When plates are to be finished entirely with etching, or with etching and dry point together, the attention of the artist will be strongly fixed upon the necessity of deepening and strengthening certain parts of his composition. It is for this purpose that stopping out and rebiting and dry-point work are used. When, however, the line engraver uses etching merely as a first preparation for his work, as to lay in the main masses and leading lines of the composition, this etching is usually slight and thin, and as the lines are not intended to show in any published prints, but only in proofs taken for the engraver's use, they may be all of uniform and very slight depth and breadth. The use of etching as a part only of the complete design, the rest being done by the burin, leads to the singularly puzzling style of art which is best seen in the famous plates of Charles Méryon (died 1868)—plates which are usually classed as etchings, but where there are strong evidences of burin work. The recent engravings of the *Chalcographie du Louvre*, reproducing important modern paintings, and such celebrated and admired work as that of Ferdinand Gaillard (died 1887), are instances of work in which the tolerably well-practiced collector can hardly say how much burin work appears.

History. Although etching for purposes of printing appeared in the later fifteenth century, and was practiced by Dürer and others in the sixteenth, it did not attain great importance until the seventeenth. The chief of etchers, so ranked by almost universal admission of those modern artists who have given attention to the matter, is Rembrandt (q.v.). This position he

gains not only by superior skill in the technicalities of the art, but even more by the greatness of his design—a design which is, nevertheless, adapted to the medium employed. Among other Dutch painters distinguished in etching were Adriaen van Ostade, Jacob Ruysdael, and Paul Potter. Among Flemish masters Van Dyck excelled especially in portrait heads. In the German school Wenceslas Hollar is one of the greatest masters in etching of the simplest form, with lines of nearly uniform thickness and laid in the simplest manner. Among French masters of the seventeenth century Claude Lorrain etched masterly landscapes, which had a wide influence upon the art, and Jacques Callot excelled especially in genre subjects. Etching declined from the eighteenth century, and in the early nineteenth its chief use was as an aid to engraving. About the middle of the century the revival began. Societies of artists for the publication of etchings were formed in the principal European cities, and an important activity developed, especially in France and in England. The two greatest etchers of the nineteenth century were probably Charles Méryon, whose romantic rendition of architectural subjects never loses its charm, and J. A. M. Whistler, an American of French training, long resident in London. His work is perhaps as important for the nineteenth century as was Rembrandt's in the seventeenth, and as a master of line he is said even to equal the latter. In Great Britain Sir Francis Seymour Haden, who confined himself to landscapes, and Alphonse Legros, a Frenchman, exercised a wide influence. Other important etchers are Sir Charles Holroyd, William Strang, D. Y. Cameron, Frank Brangwyn, and Muirhead Bone, an artist of great power and originality. The number of practicing etchers in France is much larger than in England. It includes such names as Maxime Lalanne, Jules Jacquemart (died 1880), Adolphe Appian, Charles François Daubigny, Paul Rajon, Felix Bracquemond, Martial (Adolphe Martial Potemont), and Paul Helleu; besides many of the prominent painters like Millet, Jacques Tisot, Besnard, and Raffaelli. In France especially etching was much used in the later nineteenth century for purposes of reproduction, by Flemings and others. Among important modern Belgian etchers was Rops; among Dutch, Gongkind and Storm van's Gravesande. The art also flourishes in Germany and Austria.

In the United States etching has a comparatively recent development. Little was done before the foundation in 1877 of the New York Etching Club, which was followed by similar societies in Cincinnati and Philadelphia in 1880 and in Boston in 1881. A number of the principal painters practiced also as etchers. Owing to the flooding of the market with cheap prints, the interest waned about 1892; but good work continued to be produced, and during the present century there has been a marked revival. Instruction in etching is offered in the principal art schools of the country. The etchers of the Middle West are grouped about the Chicago Society of Etchers. Among the most prominent American etchers are Joseph Pennell, Charles A. Platt, Mrs. Mary Nimmo Moran, Otto Bacher, Herman A. Webster, Ernest P. Roth, Stephen Parrish, and Cadwallader Washburn.

Bibliography. The works of P. G. Hamerton, himself a practical etcher, were of great influence in promoting the art in England; especially his

Etching and Etchers (London, 1868), republished with photogravure illustrations of great merit (ib., 1880), and in a cheaper edition (ib., 1875). Consult also: Lalanne, *Traité de la gravure à l'eau forte* (Paris, 1866); Hamerton, *Etcher's Handbook* (London, 1881); Haden, *About Etching* (ib., 1881); Koehler, *Etching: An Outline of its Processes and History* (New York, 1886); Hitchcock, *Etching in America* (ib., 1886); Herkomer, *Etching and Mezzotint Engraving* (ib., 1892); Lützow, *Die vervielfältigen Künste der Gegenwart*, vol. iii, *Die Radierung* (Vienna, 1893); Wedmore, *Etching in England* (New York, 1895); Singer and Strang, *Etching, Engraving, and Other Methods of Printing Pictures* (ib., 1897); Holme, *Modern Etching and Engraving* (London, 1902); Roller, *Die Technik der Radierkunst* (Vienna, 1903); Singer, *Der Kupferstich* (Bielefeld, 1904); Struck, *Die Kunst des Radierens* (Berlin, 1908); Preissig, *Zur Technik der farbigen Radierung und des Farben-Kupferstichs* (Leipzig, 1909); Wedmore, *Etchings* (London, 1911). The subject is also treated, sometimes at length, in the general treatises cited in the bibliography of ENGRAVING. See SOFT-GROUND ETCHING.

ETCHMIADZIN, êch'mê-âd-zên'. A famous Armenian monastery, situated in the District of Etchmiadzin in the Transcaucasian Province of Erivan, 12 miles west of Erivan, adjacent to the village of Vagarshapat (Vagharshapat). It consists of a number of buildings, divided into three parts, each surrounded by a strong brick wall, which gives them the appearance of fortresses. The church of Shoghakath, whose foundation is attributed to St. Gregory, is a cruciform edifice, with a Byzantine cupola and mural decorations in Persian style. Other noteworthy churches are those of St. Ripsime and St. Gaine. Besides the churches there are attached to the monastery a theological academy, a printing press, and a library with valuable Armenian manuscripts.

The monastery has been the seat of the Armenian Primate since 1441, and is now also the seat of the Armenian Holy Synod organized since the Russian occupation. The site of Vagarshapat was occupied by the famous town of Etchmiadzin, founded, according to local tradition, by King Eruand I in the sixth century B.C. It was fortified by King Vagharsh in the second century A.D. and became the capital of a province. The monastery was founded in the sixth century; the church of Shoghakath, however, dates from the fourth century. In 1827, during the Russo-Persian War, the monastery was occupied by the Russians, and by the Treaty of Turkmanchai (1828) it was formally ceded to Russia.

ETE'OCLES and **POL'YNICES** (Lat., from Gk. Ἐτεοκλῆς, of true fame, from ἐτεός, *eteos*, true + -κλῆς, *-klês*, from κλέος, *fame*; Πολυνέκης, of much strife, from πολὺς, *polys*, much + νεῖκος, *neikos*, strife). Sons of Œdipus (q.v.) and Jocaste. Cursed by their father for unfilial conduct, they quarreled over the inheritance, and Eteocles drove Polynices from Thebes. According to one version they agreed to reign in alternate years, but at the end of the first year Eteocles refused to resign his power. Polynices, resolved on revenge, fled to the court of Adrastus, King of Argos, whose daughter he married, and whom he induced to join him in a war against Thebes. The war that followed is known as that of the "Seven against Thebes" and played a

part in the early Greek epic second only to that played by the Siege of Troy. The names of the "Seven" were Adrastus, Amphiaraus, Tydeus, Parthenopæus, Capaneus, Polynices, and either Mecisteus or Hippomedon. In the battle before Thebes the brothers met and killed each other. Eteocles was buried with honor, but Polynices' body was left unburied until the last rites were performed by his sister Antigone (q.v.). The story forms the basis of *The Seven against Thebes* by Æschylus and of the *Phœnissæ* by Euripides. It is also noticed in the *Œdipus at Colonus* of Sophocles and in the *Suppliants* of Euripides. Consult Bethe, *Thebanische Heldenlieder* (Leipzig, 1891). See also AMPHIAURAUS; EPIGONI.

ETERNAL CITY, THE. A term applied to Rome, which was known even in antiquity as *Roma Immortalis*. Also the title of a novel by Hall Caine (1901). Consult F. G. Moore, "On *Urbs æterna* and *Urbs sacra*," in *Transactions American Philosophical Association*, vol. xxv (1894).

ETERNAL PUNISHMENT. See HELL.

ETERNITY, CAPE. See CAPE ETERNITY.

ETESIAN (ê-tê'zhan) **WINDS** (Gk. *êrhios*, *etêsios*, annual, from *êros*, *etos*, year, Lat. *vetus*, old, Skt. *vatsara*, year). The north and north-east winds that prevail in southern Europe in the summer season, apparently due principally to an indraft towards the heated portion of the African Sahara. They extend across the Mediterranean towards North Africa and are strongest in July and August.

ÉTEx, à'têks', ANTOINE (1808-88). A French sculptor and painter, born in Paris. He studied painting under Ingres, sculpture under Dupaty and Pradier, and architecture under Duban. After exhibiting in 1839 the remarkable group "Cain and his Race Cursed by God" (now in Lyons), which excels his later works in boldness and simplicity, he received the order for the two groups of "Peace" and "Resistance" on the Arc de l'Étoile. Though his versatility led him into other lines of art, he gained celebrity only as a sculptor. His works, which are in the classical style of David's school, are bold and startling in composition, but lacking in harmony, exaggerated in action. The best-known paintings are "Eurydice," which was in the Luxembourg Gallery, and "The Glory of the United States," in the City Hall, New York. The most noted of his funeral monuments is that of the painter Géricault in the cemetery of Père-Lachaise, Paris, which in 1841 brought him the cross of the Legion of Honor. He wrote: *La Grèce tragique* (1847), with 44 etched plates; *Oeuvre élémentaire de dessin* (1855-59), with 50 lithographed plates; and various notices on painters for reviews.

ETHANE, êth'an (from *ether*), C₂H₆. A gaseous compound of carbon and hydrogen, similar to marsh gas. It is one of the constituents of the natural gas rising from the earth in petroleum districts. Like marsh gas, it is colorless and odorless, and insoluble in water. It is found dissolved in crude petroleum. It burns with a pale flame, having greater luminosity, however, than the marsh-gas flame, owing mainly to the fact that ethane contains a greater percentage of carbon than marsh gas. Ethane can be more readily liquefied than marsh gas. A mixture of ethane and air is highly explosive; especially if the amount of air present is just sufficient to burn up all of the organic gas. By

gradually substituting chlorine, bromine, or iodine for the hydrogen of ethane, the so-called halogen derivatives of this hydrocarbon may be obtained. One of these—viz., ethyl iodide (C₂H₅I)—is used for the preparation of pure ethane, according to the following reaction:

Another method of preparing ethane consists in causing metallic sodium to act upon methyl iodide, the products being ethane and sodium iodide.

ETHÉ, à'te (KARL) **HERMANN** (1844-). A German Orientalist, born in Stralsund, grandson of the Pomeranian poet Karl Lappe. He was educated at the universities of Greifswald and Leipzig and became in 1867 privatdocent of Arabic, Turkish, and Persian at Munich. In 1872 he went to Oxford University to catalogue various Oriental manuscripts in the Bodleian Library (first volume published in 1889); and in 1875 he was called to University College, Aberystwyth, Wales, as professor of German and Oriental languages. He catalogued Persian manuscripts in the India office library (vol. i, 1903), edited a critical text of Ferdusi's *Yûsuf and Zulkhâ* (1908), and wrote on Persian literature and related topics for the *Athenæum*, the *Encyclopædia Britannica*, and the Strassburg *Grundriss der iranischen Philologie*.

ETH'ELBALD, or ÆTHELBALD (?-757). King of the Mercians (716-757), a son of Alweo. He succeeded Ceolred in 716, and in 731 was acknowledged as overlord by all the kings and peoples of southern and central England as far as the Humber. He ravaged Northumbria in 740 and waged a successful war against the Welsh in 743, but was defeated by Cuthred, the West Saxon King, at the battle of Burford in 752. He was probably killed by his own guards.

ETHELBALD, or ÆTHELBALD (?-800). A king of the West Saxons. He was the son of Ethelwulf (q.v.) and a brother of Alfred the Great. He is said by Asser to have formed a conspiracy to seize his father's throne in 850 and to have dispossessed him of Wessex. After Ethelwulf's death (858) Ethelbald married his young stepmother, Judith. His reign was peaceful and uneventful. Consult Oman, *England before the Norman Conquest* (New York, 1910).

ETH'ELBERT, or ÆTHELBERHT (c.552-616). King of Kent from 560 to 616. After the death of Ceawlin, King of the West Saxons, in 503, Ethelbert established his supremacy over all the English south of the Humber and was acknowledged as Bretwalda. Ethelbert married Bertha, daughter of Charibert, King of the Franks, who was a Christian, and who stipulated that his daughter should be allowed to practice her own religion. The conversion of Ethelbert was effected by St. Augustine (q.v.) in 597. After his conversion and baptism he founded the bishopric of Rochester, and in concert with his nephew, Sæberht, King of Essex, who also had been converted, erected the church of St. Paul in London. He died Feb. 24, 616. Ethelbert is also known as the author of the first written Saxon laws. Consult: Haddan and Stubbs, *Councils and Ecclesiastical Documents Relating to Great Britain and Ireland*, vol. iii (Oxford, 1871); Oman, *England before the Norman Conquest* (New York, 1910); Hodgkin, *History of England to the Norman Conquest* (ib., 1906).

ÆTHELBERT, or **ÆTHELBERT** (?-866). King of Wessex and of Kent. He was the third son of Ethelwulf, King of the West Saxons, and about 855 became Underking of Kent, succeeding to the throne of Wessex in 860. During Ethelbert's reign the southern coasts of England were ravaged by the Danes and by pirates from Gaul, Winchester being sacked by the former.

ÆTHELFLEDA, æth'el-flē'dā, or **ÆTHELFLEA'D**, æth'el-flād (?-A.D. 917). The eldest daughter of Alfred the Great, called the Lady of the Mercians. She married Ethelred, Earl of Mercia, about 880, and the two exercised almost royal power in their territories. They conducted various expeditions against the Norwegians and other pagans who threatened their realms. After the death of her husband in 911, or 912, she sent an expedition against the Welsh in 916 and captured Derby (917) and Leicester (918) from the Danes. Consult Green, *Conquest of England* (New York, 1884).

ÆTHELRED, or **ÆTHELRED**, I (?-871). A king of the West Saxons and of the men of Kent. He succeeded his brother Ethelbert in 866. His reign was greatly disturbed by the invasions of the Northmen, who now began to found kingdoms instead of making merely piratical forays. Many indecisive battles were fought by Ethelred, aided by his brother Alfred the Great (q.v.).

ÆTHELRED, or **ÆTHELRED**, II (c.968-1016). King of the English from 978 to 1016, known as the Unready. He was the son of Edgar and Elfrida. In the beginning of his reign he showed himself by no means slothful or incapable, the surname "Unready" referring to his lack of *rede*, or counsel. His reign was marked by almost continuous warfare with the Northmen. In 980 the Danes began to plunder the coasts; in 991 they forced Ethelred to purchase peace, and in 994, aided by Olaf, King of Norway, they laid siege to London. The city was saved, however, through the valor of its inhabitants. The Danes then attacked the southern coasts, but they were hindered by the defection of Olaf, who embraced Christianity and became Ethelred's ally. In the last three years of the tenth century the Danes ravaged Kent, Sussex, and Wessex. In 1000 the Anglo-Saxon King invaded Normandy and was disastrously defeated; but he made a treaty with Duke Richard II and married his sister Emma. In the spring he concluded a treaty with the Danes; but, on the pretext that they were plotting treachery, he ordered, in 1002, the murder of all the Danes in England on the same day—November 13. Among the victims was probably Gunhild, sister of Sweyn, King of Denmark. Sweyn was swift in his revenge, and for four years his army ravaged in England almost at pleasure. In 1007 Ethelred bought peace for a large sum of money. In 1009 he collected a large fleet, but it was almost wholly destroyed by a storm; the Danes renewed their ravages, and the English suffered many defeats, until another peace was purchased for money in 1012. The next year Sweyn, with the largest fleet he had ever collected, sailed up the Humber and marched towards London; but he met with such strong resistance that he gave up the plan of attacking the city and turned off to Bath, where he was proclaimed King of England by the people, who were weary of Ethelred's incompetency and exactions. London soon acknowledged Sweyn, and Ethelred fled to Normandy. Sweyn

died in the spring of 1014, and Ethelred was recalled on promising to rule better in the future. In the same year he defeated Canute (q.v.), son of Sweyn, but in 1015 Canute returned from Denmark, ravaged a large territory, and was about to attack London when Ethelred died. Ethelred married Emma, daughter of Richard the Fearless of Normandy; their oldest son was Edward the Confessor. Consult: Freeman, *The Norman Conquest*, vol. i (New York, 1873); Hodgkin, *History of England to the Norman Conquest* (ib., 1906); Oman, *England before the Norman Conquest* (ib., 1910).

ÆTH'ELRE'DA, SAINT, or **ÆTHELTHRYTH** (c.600-679). A princess of East Anglia, canonized for her saintly virtue. She was born at Exning, or Oxning, Suffolk, the daughter of Anna, King of East Anglia. She was twice married, but each time refused to consider the marriage as more than nominal. She finally became a nun and abbess of Ely, where she died June 23, 679. Her name was popularly abbreviated or corrupted into St. Audrey.

ÆTH'ELWULF, or **ÆTHELWULF** (?-858). King of the West Saxons and of the men of Kent. He was the son of Egbert (q.v.), whom he succeeded about 839. During his reign the Danes repeatedly attacked the coasts of Wessex and Kent, but Ethelwulf left the defense usually to his officers. In 855 Ethelwulf made a journey to Rome, where he remained about a year. On his homeward journey he married Judith, daughter of Charles the Bald of France. On arriving in England he found that his son Ethelbald (q.v.) had usurped the throne of Wessex. Ethelwulf made no attempt to recover the crown, but remained content with the kingship of Kent which his son left to him. The youngest of his five children was Alfred the Great (q.v.).

ETHER (Lat. *æther*, Gk. *αἰθήρ*, *aithēr*, upper air, from *αἰθεῖν*, *aithēin*, to glow, Skt. *idh*, to kindle). It may be regarded as proved that the sensation light is due to wave motion, and that all the thermal effects attributed to "radiation" are due to the absorption of waves. A train of waves is the advance into a medium of a periodic disturbance; and therefore a medium is required for the waves which produce luminous and thermal effects. This medium is called the "luminiferous ether," or, more simply, "the ether." The medium which was imagined by Faraday as a necessary part of his theory of electric and magnetic actions has also been identified by Maxwell with the ether. The fact that the ether is distinct from ordinary matter as known to us is shown by the transmission of radiation through interstellar space and through vacua, as well as by the magnitude of the velocity of such waves— 3×10^{10} centimeters, or about 186,000 miles, per second—which is greater than would be possible with any matter of properties comparable with ordinary matter. The ether has inertia, because time is required for the propagation of waves; but there is no evidence that it has weight. In fact, the passage of radiation through all bodies, to a greater or less degree, proves that the ether is a medium permeating all space, and that portions of ordinary matter, i.e., molecules and atoms, are immersed in it, as particles of dust float in the air, or small solid particles exist in water. The lengths of ether waves may be measured by suitable means (see LIGHT); and those that

appeal to physical instruments are found to vary from many miles to less than two-millionths of a millimeter. If waves as short as these last are propagated in a medium, it shows that the structure of that medium must be extremely minute, its portions—if there are any—being much smaller than the smallest wave length known; otherwise waves as short as these could not be produced. Nothing of the actual structure of the ether is known; but from analogy with matter its “elasticity” and “density” are spoken of, simply meaning those properties of restitution and inertia by virtue of which waves may be transmitted. These waves are transverse, meaning that, whatever the disturbance is, it is perpendicular to the direction of propagation. This shows that the ether must have properties analogous to the material properties of an elastic jelly, because the only form of matter which can carry transverse waves is one with rigidity. It should be observed that some forms of matter behave like solids for sudden forces, but like fluids for slow ones; thus, shoemaker's wax is brittle for quick blows, but a piece of lead put on top of the wax will in the course of time pass through, the wax flowing around it.

Waves in the ether are produced by electric oscillations, and they are emitted also by all forms and conditions of matter (see RADIATION); and the statement that these waves have identical properties—except as to wave number—is the so-called “electromagnetic theory” of light. The phenomena of radiation and absorption prove that if a minute portion of matter—an electron—is vibrating extremely rapidly, it produces waves in the ether. This establishes the fact that there is some connection between ether and ordinary matter in this case. Whether a large piece of matter moving with motion of translation drags the ether with it, or simply allows the ether to pass through it—like wind through a tree—is still to a certain extent an open question. There is, however, no decisive experimental fact in favor of the idea that the ether is dragged along, except in the experiments of Michelson and Morley to be referred to later. The accepted theory is that the ether is not affected by the passage of matter through it unless the matter is electrically charged.

It has been shown by Fizeau and by Michelson and Morley that a beam of light is accelerated by its passage through a current of water moving in the direction of the beam and retarded by an opposing current. This can be explained on the hypothesis of Fresnel that, in addition to the free ether which exists equally everywhere, there is in any transparent body an amount of ether $n^2 - 1$ times that of the free ether occupying the same volume, n being the index of refraction, and that this extra amount of ether is attached to the body and moves with it. On this hypothesis the density of the ether in the body is therefore n^2 times that of the ether in free space, meaning by density that property of the medium which measures its inertia. On the other hand, Lorenz has explained the observed facts on a simple theory of a stationary ether.

The phenomena of stellar aberration (q.v.) seem to prove that the ether near the earth must be independent of the earth's motion, or at least that there should not be produced in it what is called in hydrodynamics “rotational” motion. On the other hand, Michelson and Morley have shown that the ether near the sur-

face of the earth moves with at least very nearly the velocity of the earth, assuming that their apparatus is not affected by the motion. Lodge, however, has performed most careful experiments from which he concludes that the velocity of light between two steel plates moving together in their own planes an inch apart is not altered by an appreciable quantity. It is extremely difficult to reconcile these experimental results; and there are many others, equally confusing. Fitzgerald and Lorenz have shown that, in order to explain them, it is necessary to assume that the dimensions of solids change as they move through the ether.

It is thus seen that, in order to connect the phenomena of mechanics, light, and electricity, the assumption of the existence of the ether has been made. Upon this is based the modern mathematical theory of physics; and, combining this with the hypothesis of Fitzgerald and Lorenz referred to above, a system of equations has been deduced which is, on the whole, in wonderful agreement with observed facts. It should be noted, however, that within recent years a school of mathematicians, headed by A. Einstein, has shown that starting with a few hypotheses—not themselves based upon experiments—it is possible to deduce the same, or equivalent, equations which are in accord with actual observations. This theory of “relativity,” as it is called, does not postulate the existence of the ether.

The fundamental differences between the two points of view of nature lies in this: the classical authorities explain phenomena in terms of ideas which are connected with our senses and with our ordinary conception of matter; the followers of Einstein, on the other hand, have developed equations which are founded upon purely mathematical postulates.

Bibliography. The subject of the ether is one that presents many difficulties; and while much has been written in this connection, it is not always in a shape to be of assistance to the average reader. Consult, however: Larmor, *Ether and Matter* (London, 1901); Lodge, “Aberration Problems,” in *Philosophical Transactions* (ib., 1892-93); id., in *Philosophical Transactions* (ib., 1897); Larmor, “Dynamical Theory of the Electric and Luminiferous Ether,” in *Philosophical Transactions* (ib., 1894, 1898); Michelson and Morley, in *Philosophical Magazine*, vol. xxiv (ib., 1887); Lorenz, *Versuch einer Theorie der elektrischen und optischen Erscheinungen in bewegten Körpern* (Leyden, 1873); Wien, *Refcrat, 70. Versammlung deutscher Naturforscher und Aerzte in Düsseldorf* (Düsseldorf, 1898); Mie, *Moleküle, Atome, Weltäther* (Leipzig, 1904); Ames, *The Constitution of Matter*, (Boston, 1913). ETHER, or more properly **Di-ETHYL-ETHER**, $(C_2H_5)_2O$, also called “sulphuric ether.” A substance composed of carbon, hydrogen, and oxygen. At ordinary temperatures it is liquid; if chemically pure, it boils somewhere between 34.4° and 35.0° C. (93.9° and 95.0° F.), and its specific gravity at 0° C. is 0.736. The critical temperature and pressure of ether may be found under **CRITICAL POINT**. Ether is sparingly soluble in water, but mixes in all proportions with alcohol, chloroform, acetone, carbon disulphide, and other organic liquids. It is an excellent solvent for fats, oils, resins, many alkaloids,

and certain organic salts, including mercuric chloride (corrosive sublimate) and the chlorides of iron and copper. The collodion used in photography is a solution of certain nitrates of cellulose in a mixture of alcohol and ether. Ether is also used in the preparation of fats and in determining the amount of fat in samples submitted for analysis (see FATS); it is likewise employed for removing grease spots. Its vapors are extremely inflammable, and therefore it should under no circumstances be used in the neighborhood of artificial lights. It is very volatile and has a characteristic pleasant odor and a burning sweetish taste. Ether is made on a large scale by the action of strong sulphuric acid on ordinary alcohol. The chemical transformation takes place in two steps: first ethyl-hydrogen sulphate, $C_2H_5HSO_4$, is formed:

Ethyl-hydrogen sulphate is then converted into ether by the further action of alcohol, according to the following chemical equation:

Sulphuric acid is evidently regenerated in this transformation, and therefore the addition of acid for the production of a new quantity of ether would seem unnecessary, and ether might be said to be manufactured by a *continuous process*, a given quantity of sulphuric acid being capable of transforming an indefinite amount of alcohol. In reality, however, the acid must be rejected after the operation has been carried on for a certain length of time, owing to the formation of water and sulphurous acid during the process. The distillation is carried out in appropriate apparatus, the distilling reservoir being kept at a temperature of 140° to 150° C. At higher temperatures much ethylene gas is produced, and also, the higher the temperature, the greater the proportion of alcohol altogether carbonized by the sulphuric acid. The crude ether obtained at first contains more or less alcohol and sulphurous acid. It is purified by shaking with a solution of lime in water, the water taking up the alcohol, while the lime combines with the acid impurity. The ether is then dried with anhydrous calcium chloride and redistilled. By the use of metallic sodium, or perhaps preferably of phosphorus pentoxide, ether may be rendered absolutely free from water; sodium frees it also from alcohol. Chemically ether is a rather indifferent compound; with certain substances, however, it reacts very energetically; thus, if brought into contact with chlorine, it is rapidly decomposed with formation of aldehyde, chloral, hydrochloric acid, etc., the ether often taking fire during the reaction.

The ether used for surgical purposes contains a small amount of water and alcohol; its specific gravity varies between 0.725 and 0.728. The preparation known as Hoffmann's anodyne is composed mainly of ether and alcohol. In medicine ether is sometimes used as a local anæsthetic, producing intense cold when evaporated; if injected subcutaneously, it rapidly acts as a stimulant on the heart and respiration, and is therefore highly valuable in fainting. In America it is esteemed a safer general anæsthetic than chloroform and is therefore extensively used in surgery. Its action is similar to that of chloro-

form, the highest functions of the organism being affected first, the lowest last (law of dissolution). The stage of stimulation, however, lasts considerably longer than in chloroform anæsthesia. The administration of ether is somewhat more difficult than that of chloroform, and it is liable to have an irritating effect on the kidneys and to increase bronchitis in patients suffering from it. Within recent years the practice has been introduced of using a certain amount of laughing gas immediately before inducing complete anæsthesia by means of ether. In this manner certain disagreeable after effects of ether anæsthesia may be completely abolished. To make the administration of ether safer and less disagreeable various expedients have been practiced. The quantity necessary for a given anæsthesia can be materially reduced by giving a preliminary hypodermic injection of morphine, or morphine and scopolamine. The nauseating effects of the drug are sometimes lessened by flavoring it with oil of orange or other pleasant-smelling aromatic oil. Another method, more favored by European than American surgeons, is transfusing ether, largely diluted with normal saline solution, directly into the veins. It has also been injected into the muscles. The latest expedient to be tried in this country is the oil and ether rectal method, by which the anæsthetic, mixed with olive oil, is given as a high enema into the lower bowel. Intratracheal insufflation, in which small quantities of ether are sprayed directly into the trachea, is a difficult but useful method. (See ANÆSTHETIC.) On the other hand, the after effects of ether are said not to appear at all, if the anæsthetic is only thoroughly freed from its usual impurities. Ether is the earliest-known anæsthetic and was extensively used in Europe before the introduction of chloroform. It was discovered probably as far back as the thirteenth century. For a long time it was supposed to contain sulphur, and hence the name "sulphuric ether" was applied to it. Its true composition was established by Saussure (1807) and by Gay-Lussac (1815). Later Williamson explained its formation and chemical constitution. Since the middle of the nineteenth century it has, unfortunately, been used in Ireland and elsewhere as an intoxicant. The effects are somewhat similar to those of opium: digestion is impaired, the heart becomes irregular, and gradually nervous exhaustion and general weakness are produced; the weakness of the body is followed by weakness of the will, hallucinations, and mental confusion.

ETHEREAL SALTS. See ESTERS.

ETHEREGE, or **ETHRYGG**, GEORGE. An English classical scholar, born in Oxfordshire. He was educated at Corpus Christi College, Oxford, where he was professor of Greek from 1547 to 1550 and from 1554 to 1559. He also received the title of bachelor of medicine and was licensed to practice, and this profession he followed after the loss of his professorship, due to his Catholic sympathies, soon after the accession of Elizabeth. He was the author of a translation of certain of the works of Justin Martyr, a Greek poem on the deeds of Henry VIII, and a volume of Latin poems; and he set to music the Psalms of David, in the original Hebrew.

ETHEREGE, SIR GEORGE (?1635-c.1691). An English dramatist, born in Oxfordshire. There is some reason to suppose that he spent a short time at Cambridge and traveled subse-

quently on the Continent, where he acquired a gentleman's knowledge of French. His first comedy, *The Comical Revenge, or Love in a Tub*, was produced in 1664, with remarkable success, and gained its author the patronage of the court. In 1667 came *She Would if she Could*, which also achieved success and was followed in 1676 by Etherege's last play, *The Man of Mode, or Sir Fopling Flutter*. The play owed its favorable reception, in the main, to the fact that its characters were faithfully drawn from well-known men of the time. Etherege was one of the best-known libertines of the day and a boon companion of the notorious Sir Charles Sedley. After receiving knighthood he was given a diplomatic charge on the Continent, and in 1685 was English representative at Regensburg, where he aroused intense dissatisfaction by his licentious conduct. He died in Paris. Editions of his plays appeared in 1704, 1715, and 1735. His works were edited, with an introduction, by Verity (1888). Consult an essay by Gosse in *Seventeenth Century Studies* (London, 1895) and *Cambridge History of English Literature* (New York, 1907-13).

ETHERIDGE, JOHN WESLEY (1804-66). An English Wesleyan Methodist clergyman and scholar, born on the Isle of Wight. Entering the ministry in 1827, he occupied Brighton and Cornwall circuits, and for several years was pastor of a church at Boulogne, France. He became a noted Hebrew and Syriac scholar. His works include: *The Apostolic Ministry and the Question of its Restoration Considered* (1836); *Misericordia, or Contemplations of the Mercy of God* (1842); *Horæ Aramaicæ* (1843); *The Syrian Churches: Their Early History, Liturgies, and Literature* (1846); *The Apostolical Acts and Epistles from the Peschitto, or Ancient Syriac, to which are Added the Remaining Epistles and Book of Revelation from a Later Syriac Text* (1849); *Jerusalem and Tiberias; Sora and Cordova: A Survey of the Religious and Scholastic Learning of the Jews* (1856); *The Life of Thomas Coke, D.C.L.* (1860); *The Targums of Onkelos and Jonathan ben Uzziel on the Pentateuch; with the Fragments of the Jerusalem Targum* (2 vols., 1862, 1863); *The Life of the Rev. Adam Clarke* (1858). Consult the *Memoir* by Thornley Smith (London, 1871).

ETHERIDGE, ROBERT (1819-1903). An English paleontologist, born at Ross, Herefordshire. In 1850 he was appointed curator of the museum of the Bristol Philosophical Institution. He became assistant paleontologist in 1857 and paleontologist in 1863 of the Geological Survey. From 1881 to 1891 he was assistant keeper in geology of the British Museum, and from 1865 to his death he was an assistant editor of the *Geological Magazine*. He became a fellow of the Royal Society in 1871 and served as president of the Geological Society in 1881-82. Besides publishing several important essays and a *Catalogue of Fossils in the Museum of Practical Geology*, with Huxley (1865), and revising the second edition of part ii of Philip's *Manual of Geology* (1887), he prepared an elaborate catalogue of the *Fossils of the British Islands, Stratigraphically and Zoologically Arranged*, of which only vol. i was published (1888).

ETHERS. An important class of carbon compounds related to the alcohols (q.v.). Their relation to the alcohols is analogous to the rela-

tion of the metallic oxides (like K_2O) to the metallic hydroxides (like KOH). Thus, while the composition of ordinary ether (the liquid used for anaesthesia during surgical operations) is represented by the formula $(C_2H_5)_2O$, the composition of ordinary alcohol is C_2H_5OH . While, therefore, an alcohol may be defined as a hydroxide of a hydrocarbon radicle (like methyl, CH_3 , or ethyl, C_2H_5), an ether may be defined as an oxide of such radicles. The close relationship existing between ethers and alcohols is shown by the readiness with which the former may be prepared from the latter. Thus, ordinary ether is usually made by the action of sulphuric acid upon alcohol. (See ETHER.) Another method by which ethers may be prepared is very ingenious and serves to demonstrate clearly their chemical constitution. It consists in treating a halogen derivative of a hydrocarbon, such as ethyl chloride, ethyl bromide, or ethyl iodide, with the sodium compound of an alcohol. Ethyl iodide is represented by the formula C_2H_5I ; sodium alcoholate, by the formula $NaOC_2H_5$. Since sodium (Na) has a great affinity for iodine (I), the iodide and the alcoholate will, on being mixed, readily enter into chemical reaction, by virtue of which a transformation will take place that can be represented only by the following scheme, which leaves no doubt as to the constitution of the ether molecule:

Ethers are usually subdivided into *simple* and *mixed*. The two hydrocarbon radicles in a simple ether are identical; in a mixed ether they are different. Thus, ordinary ether is a simple ether, its formula being $(C_2H_5)_2O$. On the contrary, methyl-ethyl ether, represented by the formula $CH_3 \cdot O \cdot C_2H_5$, is a mixed ether. Mixed ethers may be prepared by the same methods as simple ethers. Thus, methyl-ethyl ether may be obtained either by treating a mixture of methyl alcohol (wood alcohol) and ordinary (ethyl) alcohol with sulphuric acid, or, preferably, by treating sodium methylate ($NaOCH_3$) with ethyl iodide (C_2H_5I).

The ethers are, as a rule, very stable compounds, not readily affected either by dilute alkalis or acids. Most of them are light, volatile, inflammable liquids, insoluble in water, but readily soluble in the alcohols. The most typical and useful compound of the class is ordinary ether. The chemical constitution of the ethers was first elucidated by Williamson in 1855.

The term *compound ethers* is sometimes applied to another class of compounds, which are, however, at present usually termed esters, or ethereal salts. See ESTERS.

ETHICAL CULTURE SOCIETY. See SOCIETIES FOR ETHICAL CULTURE.

ETHICS (Gk. τὰ ἠθικά, *ta êthika*, or ἡ ἠθική, *hê êthikê*, ethical science, from ἦθος, *êthos*, custom, habit). The science of morality. The term "ethics" is frequently used in popular speech as the synonym of morality or of a particular moral code current in some circle or profession, as when we speak of medical ethics. But it is preferable to confine the term "ethics" to the description of a theory of morality. Morality is an art; i.e., it is a way of living and of doing. Ethics is the attempt scientifically to understand this way of living and acting. In

the definition given above the subject matter of ethics is stated to be morality. It is important to notice that ethics does not presume to construct morality out of whole cloth. Like any other science, it deals with actual phenomena that exist before the science comes into being. If there were no such thing as morality in the world, if men had not a consciousness of obligation, did not feel the attractive power of moral ideals, and did not find satisfaction in the realization of these ideals, there would be no ethics, any more than there would be mineralogy in a nonmineral world. But since morality is as indubitable a fact as crystallization, it piques curiosity to the comprehension of it. Among the questions that arise are the following: What is morality? Is it explicable as a result of evolution? When thoroughly understood in its fundamental features and in its historical development, is it seen to be a reasonable fact, or is it a prejudice to be outgrown or an infantile way of behaving, to be put away with many other childish things, when once we arrive at the age of discretion? If it is something of permanent value, is there any way in which its value may be enhanced?

It is necessary to be on our guard when we come to ask what morality is. The question is often confused with that other question, What ought morality to be? This latter question, however, cannot be answered till the former is answered, any more than the question what ought a healthy man to be can be answered till we know what actual health really is. The morality of a certain man, or of a certain people, or of a certain time, is itself amenable to a higher standard of morality only in the sense that actual empirical healthfulness is amenable to a higher standard, idealized from experienced health. But what is that standard? Here we come to a point concerning which there is a fundamental difference of opinion. Some say the standard is God's will (theological voluntarism); some that it is pure reason (rationalism); some that it is pleasure, either of the individual or of a community of individuals (hedonism, egoistic and universalistic); some that it is perfect biological adaptation to the environment (biologism); some that it is perfection, variously defined, of the individual or of the race (perfectionism, the ethics of self-realization). In view of this difference of opinion, it seems impossible to answer offhand the question what morality ought to be. But the question what morality is and has been is more hopeful. Although the moral consciousness is anything but simple, still it is open to study and description.

In the first place, the form or type of moral consciousness we are best acquainted with is one that is capable of appreciating an antagonism between two or more motives. If there were never a competing desire standing out against the course eventually adopted, or, to use the language of religious experience, if there were no temptations, there would be no morality such as we know. This feature will be discussed below.

The second characteristic of mature moral consciousness is that without the capacity for self-consciousness it could not exist. The motives in the moral consciousness are not merely desires for this and that object, but desires which may be considered by the agent as indicating his own character. The significance of

this feature of morality can be brought out better by comparing the consciousness of a presumably nonmoral being with that of a moral being. A cat may desire a warm berth on a bed and may be averse to the slapping that comes to her when caught on the bed. But, so far as we know, while the cat has desires and aversions, she does not think of *herself* as a being whose conduct can be discriminated from that of other beings. Her attention is turned upon the things she wants; it is not directed upon herself as wanting these things. Though she has a distinctive nature, for herself this nature is not an object of contemplation, as man's own nature becomes for him at times a character reflected upon.

A third characteristic of moral consciousness is that the idea of self as doing or being has an emotional and motive value. It attracts or repels. Not only does the moral agent have at times the idea of himself as doing this thing or not doing it, but he likes or dislikes himself when he thinks of himself as doing or not doing some particular thing. Such an idea of self which attracts the agent to realize it in act is called an ideal self.

The definition of a moral agent, as an agent with an ideal self as an end which excites desire, and enters into competition with other ends, leaves out of account the social nature of morality, the fourth characteristic to be mentioned. The ideal, to be ethical, must be a social ideal. That is, the idea of self which is the end of action is in morality and immorality the idea of a self in essential relation to other selves. Man, as Aristotle wisely observed, is by nature a social animal, and human morality is social to the core. Whether any other morality is possible is not here in question. In all probability self-consciousness develops only as a reflection from the consciousness that others have of us. Our attention is directed to ourselves only after we have observed others paying attention to us. And the self we thus reflect upon takes its emotional coloring and motive value from the attitude our fellows take towards us. Because, then, the moral agent is a self-conscious being in a social environment, morality is social; and when we say that it is social, we say that it is not a matter of the individual's arbitrary construction. He does not choose his ideal entirely at his good pleasure. He finds a general ideal in the society into which he is born and in which he is reared, and this ideal forms at least the point of departure for his own mature ideal. There are certain things expected of a member of society, and this expectation forms a nucleus around which the individual ethical development proceeds. The moral man does not break away completely from these traditions. The moral man is one who is "centred in the sphere of common duties."

Another feature of morality needing mention is that these common duties have in most cases a real or assumed reference to the welfare of the community. The obvious reason for the condemnation of murder, adultery, rape, theft, lying, cowardice, and intemperance, to mention some of the most prominent objects of moral judgment, is that these acts are injurious to society. The murderer, the adulterer, the ravisher, the thief, the liar, the coward, and the intemperate are common enemies, and the disapproval they receive is, at least in part, the

natural reaction of society against its foes. That in great measure morality is action really or supposedly conducive to social welfare, and immorality is action really or supposedly conducive to social degeneration, is proved by the fact that actions once regarded as ethically indifferent come to be regarded as moral or immoral when the general opinion comes to regard them as socially beneficial or injurious. The gradual change in the moral status of slavery, of concubinage, of general sexual laxity in men, of the duel and the vendetta, is historically traceable to growing insight into the social consequences of these practices. The process of the moralization of formerly ethically indifferent acts is observable in our own day. In many places lynching is morally justified by the community at large. The mob law exercised on some dastardly criminal is considered moral because it not only "serves him right," but also is supposed to protect society against future outrages. But when it is seen that such protection does not protect, but tends to undermine the very foundation of law and thus render society insecure, a sentiment grows that lynching is morally wrong. The sentiment lags behind the insight, but it follows it, even though at some distance. Not only is it true that obviously injurious actions are morally condemned, but supposedly injurious actions are likewise condemned. It is thus patent that real or presumed relation to social welfare is a constituent element in morality. It should be remarked here that nothing has been said of the size of the community with whose welfare morality is bound up. In primitive communities moral obligation has no reference to anything outside of the family, the clan, or the tribe. Even at the present day many a man who would not think of swindling a neighbor may have no scruples when it comes to taking advantage of a foreigner, especially if the foreigner be of a nationality utterly alien to his own. But the community within which moral relations are recognized need not be in any sense one of blood relationship. It may be one of trade or calling, or it may be some quite artificial fraternity. All this goes to show that actual morality is not catholic and cosmopolitan, but is apt to be cliquish and clannish, and the size of the community involved is determined by various causes. But these facts do not make against the statement that moral consciousness, wherever found, is the consciousness of social import, or of an ideal self who takes delight in and works for the welfare of some fellow beings organized together in some way.

We have as yet left out of account what probably many would regard as the most distinctive feature of morality—the consciousness of *obligation*. Thus, it is alleged, however erratic from our point of view modes of conduct approved in foreign lands and in past ages may be, some definite course of conduct has always been regarded as binding. The fact of the obligation of some act or another, it is asserted, is, and has always been, recognized by every human being. There is the *form* of imperative-ness, so the contention runs, in all human consciousness; this constitutes the framework of morality. The content, the matter, of morality varies indefinitely; the form is immutable. Some such thought as this controlled the mind of Socrates in his attempt to disprove the doc-

trine of relativity (q.v.), as applied by the Sophists (q.v.) to the ethical life. Plato hypostatized this immutable essence of morality into the eternal supreme "form of the good," the authoritative pontiff, as it were, within a hierarchy of ideal essences. Aristotle, doing justice to another type of moral experience, found morality to consist in certain obligations imposed by the desire to secure certain ends. Christian theology, following St. Paul, construes it as God's law of righteousness—"that which may be known of God" and "is manifest even in the Gentiles, for God manifested it unto them" (Rom. i). "For when the Gentiles, which have not the law, do by nature the things contained in the law, these having not the law are a law unto themselves; which shew the work of the law written in their hearts, their conscience also bearing witness, and their thoughts the meanwhile accusing or else excusing one another" (Rom. ii. 14, 15). Ethical intuitionism (q.v.) takes its cue from traditional theology, and finds a "faculty" of conscience in every man; a faculty which may become atrophied in those who stiff-neckedly refuse to give it play, but which is an always present element in the original equipment of faculties possessed by every man. Ethical rationalists (see RATIONALISM), of whom Kant is the great protagonist, ascribe to pure reason an invariable mandatory activity, which operates in every rational being to the production of a recognized obligation to do certain things and to leave certain things undone, just because this doing and this leaving undone is pure reasonableness. In Kant this demand of pure reason is formulated in the principle, "Act only on that maxim whereby thou canst at the same time will that it should become a universal law." This he calls the "one categorical imperative." This "law contains no conditions restricting it," it "is objectively necessary in itself without reference to any purpose." It has its seat and origin completely a priori (q.v.) in the reason, and that, moreover, in the commonest reason just as truly as in that which is in the highest degree speculative; "it is just the purity of" its "origin that makes" it "worthy to serve as our supreme practical principle." "There is no genuine supreme principle of morality but" this which rests "simply on pure reason, independent of all experience." Hedonism (q.v.) roots the universal, unvarying form of morality in the desire of every sentient being to secure pleasure. In what is called the psychological form of hedonism the view is held that "on the occasion of every act he exercises, every human being is led to pursue that line of conduct which, according to his view of the case, taken by him at the moment, will be in the highest degree contributory to his own greatest happiness." (Bentham.) In the ethical form of hedonism it is conceded that "men often, from infirmity of character, make their election for the nearer good, though they know it to be the less valuable; and this no less when the choice is between two bodily pleasures than when it is between bodily and mental. But while men thus do choose the less valuable pleasure, "it may be questioned whether any one who has remained equally susceptible to both classes of pleasure ever knowingly and calmly preferred the lower." Happiness is "the rational purpose of human life and action." (J. S. Mill.) The happiness which reason

prescribes as the proper end of life may be conceived as one's own happiness (egoistic ethical hedonism), or it may be the happiness of all sentient creatures (universalistic ethical hedonism), or it may be something intermediate. But however narrowly or broadly conceived, reason is said to demand an effort to secure it and thus to impose an obligation. Perfectionists claim that what is demanded is not happiness, but the full, harmonious development of one's nature and of the nature of one's fellows, until we all attain unto the stature of the perfect man. Certain evolutionists consider the supreme end which imposes obligation to consist in improvement of "the social tissue." (Leslie Stephen.) In all these views it will be seen there is an insistence upon the fact that obligatoriness is an essential mark of morality. Though they differ widely as to the source of obligation, they all agree that coextensive with morality is the phenomenon of obligation.

On the other hand, we find some writers who maintain that obligation is only an accident of morality. Herbert Spencer, in his *Data of Ethics*, comes to the "conclusion, which will be to most very startling, that the sense of duty or moral obligation is transitory and will diminish as fast as moralization increases." "With complete adaptation to the social state, that element in the moral consciousness which is expressed by the word 'obligation' will disappear. The higher actions, required for the harmonious carrying on of life, will be as much matters of course as are these lower actions which the simple desires prompt. In their proper times and places and proportions the moral sentiments will guide men just as spontaneously and adequately as now do the sensations." Among the poets this view is by no means rare.

These two opposing interpretations of morality—the one that regards the consciousness of obligation as indispensable to morality, and the one that regards it as a transitory feature which will be outlived—are each in part true and in part false. The facts warrant us in saying that it is not necessary to the morality of an act that the agent should regard it as obligatory. Many actions which, except upon some preconceived theory, no one would hesitate to pronounce moral, are spontaneous or habitual. A cup of cold water, even when not given "in the name of a disciple," or of the giver's or the recipient's "pleasure," or of "the greatest happiness of the greatest number," or of "the social tissue," or of somebody's "perfection," or of "the moral sense," or of "a universal law of Nature," may yet change hands in an unquestionably moral act. What is required to make the gift moral is that it should be made by one who is *capable* of the consciousness of obligation, and that it should not be regarded by him as a contravention of moral obligation. Not necessarily the presence of the consciousness of moral obligation in each moral act, nor even the absence of the consciousness of disloyalty to a moral obligation, but the susceptibility of the agent to a feeling of obligation, is a universal feature of moral conduct. While susceptibility to obligation marks the moral agent as distinguished from the *nonmoral* doer of acts, a moral act as distinguished from an *immoral* act may be performed against a felt obligation. [The uneasy consciousness of disloyalty to a traditionally recognized moral ob-

ligation is compatible with morality, provided the agent has come to recognize an obligation superior to the traditional; for his habitual reverence for the old law and the knowledge that he is drawing on himself the opprobrium of its adherents may fill him with vague misgivings at the very time when his conduct is prompted by fealty to the new order. He acts against the *feeling*, while acting in harmony with the *knowledge*, of moral obligation. Such action, instead of being immoral, or even *nonmoral*, is a supreme instance of moral heroism. But when the path of duty has been worn smooth by habit, the wayfarer thereon is none the less moral because for the most part he forgets the manner of path he is treading. In the soldier who has been through severe discipline habituated to obedience, the sense of coerciveness has disappeared. The soldier may no longer be explicitly conscious that some other person exacts of him a certain mode of behavior. In general, he may no longer exact this of himself. It has become his nature to do this, and that is all there is to it. But often, again, that is not all. There come times when his nature does not prompt him without hesitation. Then the question arises, "What ought I to do?" This need not mean, "What must I do to escape the guardhouse?" There may no longer be a consciousness of subordination to some external authority, in the sense of some person or some organization that actually demands compliance with certain rules. And yet there is not the sense of license to do anything one may like. Something still *ought* to be done, and something *ought not* to be done. If, however, habit should have altogether become blind second nature, if the agent should have outlived the ability to think in terms of obligation, his action would have lost that one distinguishing mark which differentiates morality from what appears to be the nonbenevolent coöperative beneficence of ants. If morality is to be a term having any specific meaning, it must be saved from application to a condition of affairs in which an idea of obligation is never present any more than are "the evils of starvation at a time when a healthy appetite is being satisfied by a meal." (Spencer.) Our conclusion, therefore, is that acts not recognized as obligatory may be moral if performed by beings capable, on due occasion, of recognizing them as obligatory.

But what is the consciousness of obligation? In how many forms does the consciousness of obligation appear? What gives rise to these various forms? How does moral obligation differ from other obligations? All these questions demand answer in a systematic ethical discussion.

Let us answer the first question by saying that no single definition can be given of obligation. Rather is it true that there are at least two quite different types of the consciousness of obligation, each of which must be described in its own way. Following Kant, we may call these two types the categorical and the hypothetical. In the latter case a person is conscious that he ought to do a thing if he wants to secure a certain end; in the other he judges that he ought to do a thing, without being able to assign any end, as the necessary means of obtaining which the action is obligatory.

Taking up first the consciousness of conditional obligation, which is called the hypothetical imperative, we find that the experience in

which it appears can be described as follows: "I want a certain result; and a certain act is indispensable if I am to secure that result. Therefore in so far as I am motivated by the desire and directed by my judgment I must in consistency perform the act." The fact that when a certain desire and a certain judgment respecting the means of satisfying this desire are present in experience a certain act is felt to be required for consistency's sake, is the fact of hypothetical or teleological obligation. When I experience that requirement in my consciousness, I say that I ought to do that act. Man as desiring and as not doing what he knows to be necessary to secure a certain object is man at odds with himself. He is inconsistent. His action does not comport with his desire, and because he knows that there is incompatibility his action does not comport with his knowledge. It is unintelligent and irrational. The irrationality of the act is concrete and not abstract. It consists in incongruousness with a known definite situation. Vary the situation, and the demand of reason or the obligation varies likewise. The obligation is contingent, because reason itself alone cannot create it. But given a desire and a knowledge of some means to gratify it, there always is in a thinking being, just so far as he reflects, the consciousness of the incompatibility between the existence of the desire and a failure to perform the act known to be a necessary means of satisfying the desire. In case there are two desires, and the necessary measures to be taken to appease them cannot both be taken, there arises a conflict of obligation. This conflict is adjusted only when one desire has become a preference. Then its corresponding obligation overrides the other. "Practical reason" is just the acquiescence in the ascendancy of this desire, and the decision in favor of that conduct which this desire imposes. Often the part played by "reason" in the conflict of obligations is different, for it often happens that the relative strength of a desire is modified by knowledge of the results that follow its gratification. The gaining of this knowledge introduces a new situation, and the desiderative attitude taken towards the foreseen consequences modifies the previous desire, strengthening, diminishing, or counteracting it as the case may be. The former object may still appeal, but its appeal is overborne. In such a case we are said to do what we reasonably ought to do. The teleological obligation is, then, the control of present conduct by an idea of a future good as opposed to the solicitation of some more immediate good.

But there are obligations which are categorical. Often we do not say to ourselves, "Do this because you want that," but merely, "Do this." There arises in consciousness a command saying "Thou shalt" or "Thou shalt not," and often this commandment is recognized as having rightful authority. How does this command arise?

To some extent, without question, it arises by reason of an economical tendency to abbreviation, characteristic of all mental processes. We begin by saying to ourselves, "Do this because you want that," and we end by saying shortly, "Do this." And not only may we fail to give a reason, but, as often happens in other reasoned processes, we may come to forget that we have had a reason. Then the command appears as

self-evidently reasonable. That this process actually takes place cannot be denied. But it is perhaps not the strongest influence at work in producing categorical imperatives. For this we must perhaps look to another principle well recognized in psychology, though not often applied to explain the consciousness of unconditional obligation.

The principle in its simplest form appears in hypnotism (q.v.). It is well known that a hypnotic subject feels constrained to follow almost all the commands of his hypnotizer. Ordinarily he unhesitatingly obeys, and does not question the latter's right to issue orders. He may begin to do something else, but feels a restraining force. If he stops short of full performance, he will say to himself, as one of Ochorowicz's patients is recorded to have said, "I have something yet to do." (Ochorowicz, *Mental Suggestion*, Eng. trans., p. 63, New York, 1891.) This susceptibility to the word of command is not peculiar to hypnosis. We all know how strong is often the impulsion to do what a man with "strong personality" orders us to do. We say he has "personal magnetism" and can make everybody do what he wants. We are also coming to say sometimes that he hypnotizes us.

Now, if we reflect that there are certain commands that have been issued to us from our infancy up, by those who in our childhood imposed themselves upon our will; if we remember that every time we were caught disobeying them we were made to feel the inexorable resolution in all our friends to hold us up to the law laid down; if we consider how our countertendencies were sternly checked while the "suggestive" force of the command was allowed free swing—can we wonder that, in presence of such a constant, uninterrupted imposition of commands upon us, even the most stubborn of us have come to feel, when we fail to live up to those laws, as the hypnotic subject above alluded to felt—that we "have something yet to do"? Gradually the very thought of acts contrary to these commands calls up in our consciousness the momentous words "Thou shalt not," and the long habit of acknowledging their authority accords them, when thus revived, the same recognition of rightful claim over us as they had when enforced by parent and teacher and preacher and exacting neighbor. The outer law of man becomes now the inner law of "conscience," and under the influence of current conceptions may be referred to some *daimon*, as by Socrates, or to some ministering angel, or to God's voice in man's soul. All these explanations are but attempts to explain the fact, easily explicable by psychological laws, that "when Duty whispers low 'Thou must,' Duty is only a reverberating echo of old commands indelibly inculcated on us by all the personal agencies that have taken part in our moral education. Reason may have no part to play in this process. The most absurd commands may be imposed and be loyally accepted as unconditionally binding, as the history of morals shows.

But a time comes in the history of some individuals when the spell of the word of command is broken. They begin to ask, "Why must I be moral?" They challenge the authority of arbitrary demands and seek a reason for the moral law. This is a critical moment, big with possibilities of progress or downfall. In default of wide experience a man may at such a juncture devote himself to what he calls pleasure seeking.

If, however, it can be shown him that the law did not enter that offense might abound, but, in large measure, that invaluable human ends might be realized, the desire he may naturally have for these ends may turn into conditional, teleological imperatives the obligations heretofore blindly accepted but now questioned. Open-eyed submission may take the place of the blind hypnotic control, now spurned; and "in the confidence of reason" he may come to yield himself a loyal subject to the law as a law of liberty. Categorical morality, the morality of code, gives place to reasonable morality, a moral of insight into values. Law as a rule-of-thumb gives place to law as an intelligent principle of conduct.

When the change takes place, it must be expected that the contents of the law will not remain wholly unchanged. Of the many exactions made in the name of morality, it would be strange if some are not found useless or even mischievous. In the nature of the case this discovery can never in its completeness be the work of any one man or age. The problem is too complex, and the complexity is increased by a constant shifting of values. (Nietzsche's *Umwertung*.) A teleological morality is that system of conduct that most completely meets human needs and realizes human aspirations. As needs and aspirations vary, so teleological morality must vary. Thus, the partial solution of the moral problem of one age means a change in the terms of the problem for the next; for every partial solution creates a new situation giving a new outlook, and the exact attitude of new beings to a new situation with a new outlook can never be foretold by human prophecy. This, however, is no reason for despair; for only those who look forward with ecstasy to stagnation could wish to have the problem of morality definitely solved with one flash of insight. But while the problem is never solved definitely, it is progressively solved. Modifying Hegel's famous dictum, we may say, *Die Sittengeschichte ist das Sittengericht* (the history of morals is the judgment of morals). But whatever may be the form which the solution takes at any particular time, this form is now imposed categorically upon the young and immature, so that what is teleologically obligatory for the man of insight becomes categorically obligatory for the unsophisticated.

We thus see that moral obligation can be described in terms of neither the categorical form alone nor of the hypothetical form alone, but these two forms of obligation represent different stages of morality. Teleological ethics and duty ethics each leaves, therefore, out of account a large part of the moral phenomena. The rival schools ought to join hands in recognizing that each is true to certain facts of the moral life, while neglecting others upon which its rival has concentrated its attention. But it is not enough to know that morality tends to become teleological, as men become more intelligent. Men have desired to know what end it comes to recognize as imposing the obligation to be moral. Is there any single object the desire for which is supreme in all human beings who know what they are about?

Hedonism (q.v.) attempts to furnish an answer to the question. It maintains that we ought to be moral, i.e., to do the acts and have the dispositions ordinarily described as moral, because we desire to obtain the greatest amount of pleasure possible or the least possible amount

of pain, whether the pleasure and pain be the agent's or some one else's, and because morality is the course which we must pursue in order to obtain this end, which for brevity we shall call the hedonic end. For the hedonist moral actions are obligatory because the plan of human lives, as involving the pursuit of a maximum of pleasure or a minimum of pain, imposes this obligation as a means to the realization of the hedonic plan. But questions arise now as to the hedonic plan on which morality as an obligation is said to rest. Is this plan an actual plan in all rational human lives? If not, are those who do not adopt it exempt from morality? If they are not exempt, is this because they ought to adopt the hedonic plan? If they ought to adopt it, what imposes *this* obligation? On these points hedonists differ, and it cannot be said that any answers given are satisfactory. Bentham and others maintain that the hedonic end is the actual end of every human being, and for this reason it *ought* so to be. This doctrine is called psychological hedonism. But Sidgwick (q.v.), another hedonist, says with point that if an end is an actual end of conduct in every case, there is no propriety in saying that it ought to be; and that the hedonic plan is not the actual plan of all, or even of most, human lives. Most persons pursue such ends as the acquisition of wealth, of knowledge, of reputation; they do not seek pleasure pure and simple. Nor is it true that they seek wealth, knowledge, and reputation merely because they regard these as means to future pleasure, any more than the normal man eats merely or predominantly for the sake of the pleasure that comes from the stimulation of his palate by food or from a full stomach. The ordinary man eats his three meals a day, for the most part, either because he is hungry or because he has a three-meal habit; it is true that the expectation of pleasure from his meal often has a part to play in the matter; but careful introspection will perhaps show that it is not often a very influential factor in determining his eating.

Most of the things we do are not done, then, for the sake of the pleasure we expect to get from the doing. If, now, it is the hedonic plan that imposes moral obligation, what about the large number of persons to whom the hedonic end is not a supreme end? Are they exempt from moral obligation? It would be a rash hedonist who should say Yes, in face of the fact that these very persons who do not pursue a hedonic end yet admit moral obligation. Many hedonists, therefore, prefer to say that the pursuit of pleasure is not always, but always ought to be, the supreme end of life. This doctrine is called ethical hedonism. But if it ought to be, what imposes the obligation? The answer given by ethical hedonists is that the obligation is self-evident: every reasonable man will upon reflection recognize that pleasure is the only end worth striving for. But unfortunately such a statement is not true; too many intelligent persons who have understood clearly the terms of the proposition have denied it point-blank; and a proposition denied by an expert may indeed be true, but it is not *self-evident*. How, then, prove that every one ought to pursue pleasure? What plan of life is there that can impose such an obligation? To this question several answers have been given. Just one answer need be cited here. Some say that *reason* requires that one should pursue pleasure. Thus, Sidgwick in the last

insensible to the ordinary moral ideas of the time, because these ideas are incompatible with ideas they have long held. Perhaps the insensibility has become chronic; perhaps it is still remediable. Only experiment can determine. These persons are not moral idiots, i.e., not non-moral. They are moral unfortunates; they may not even be seriously immoral in the sense of coming far short of meeting such moral obligations as they have come to recognize. Still other persons have begun life with the normal ideals, but for one reason or another they have not lived up to these ideals, and have gone so far as to give up the ideals entirely. All these differences must be taken into consideration when one is asking whether a particular departure from ordinarily recognized morality means immorality or nonmorality. It is immorality only when the moral obligation, practically ignored, is still recognized as binding.

But this leads to other questions. Of two different moral standards, can one be said to be more moral than the other? Is there a standard for testing the relative excellence of actual moral standards? Is the actually existent morality subject to evaluation by comparison with a morality which ought to be? If so, what is this standard? How is it ascertained? What imposes it as a standard upon actual morality? These questions have often been thought to be absolutely unanswerable by any science of ethics, for it has been said that science describes, but does not prescribe; that a science of ethics, in the sense of a systematic presentation of actual moral judgments, can indeed be constructed, but not a science which shall criticize actual morality and suggest improvements. Such a statement as to the limitations of science is inadequate. It is perfectly true that no science directly prescribes. The science of geometry does not prescribe surveying, nor does the science of electricity prescribe electric lighting. What a science can do is to describe the conditions which must be met before a given aim can be attained; and among several means to the attainment of an end, it can point out that which involves the least effort or that which is the best under given circumstances. Every so-called practical science is a more or less systematic knowledge of the conditions which must be met before a certain result can be obtained; but it cannot be accurately said to prescribe the result. The result is prescribed by some need and the means to its attainment is described by the science. Now, ethics is a practical science. It makes no absolute prescriptions. All it does is to study the facts of the moral life, and as a result it may be more or less able to describe the conditions that must be fulfilled before any accepted end of the moral life can be realized. This study does reveal many imperfections in actual morality, but these imperfections which we now have to mend are imperfections of means and not of ultimate end. This discussion will enable us to answer the questions placed at the beginning of the paragraph. Of two moral standards, in the sense of moral rules prescribed for the attainment of a certain accepted moral end, one may be more moral than another, in the sense of being better adapted to attain the moral end. The standard by which two such differing moral standards may be tested is that of conduciveness to the moral end. The existing morality, in so far as it consists of such rules, may easily be defective,

and a more adequate knowledge of all the pertinent facts may result in the discovery of a morality that ought to replace the actual morality. This discovery is the business of science; the acceptance of the obligation to forsake actually observed rules and to adopt the newly discovered rules of action is the work of the moral agent as a person with a supreme plan reasonably pursued. Thus, it appears that while ethics is concerned with the morality that is, it may also discover conditions formerly unknown; and this discovery may react on the morality that is, making it more like what it ought to be: i.e., it may make moral action more commensurate with the moral end.

Scientific ethics might conceivably do even more. Supposing for the present that actual moralities have had no single ultimate end consciously arrived at, but different ends set up in different communities and at different times, ethics might also discover how it came about that there was thus a multiplicity of ends, and it might even discover that there was a way of harmonizing these various ends. It might be able to describe an end which, if realized, would include the realization of all, or of the larger number, of these historical ends. But here, again, a science could not as a science prescribe this inclusive end. Unless the end, as inclusive, appealed to men, ethics could not force it on them. It would occupy a position similar to the science of telegraphy. When it was discovered that it was possible to send a message over long distances with great rapidity, this bit of scientific knowledge did not prescribe to men the adoption of the means of transmission. It was only human needs that imposed the obligation to adopt telegraphy. This inability of science to impose new ends constitutes part of the tragedy of scientific inventions. Many a man has devoted his life to making possible the attainment of a new end, only to find when his labors were done that the end was not desired by mankind at large.

Now, as a matter of fact, it can be said that ethics has discovered a multiplicity of ends among men. As we have seen, sometimes it is social welfare, sometimes it is individual welfare, that men make their supreme end. Again, both social and individual welfare are very differently conceived in different times and places. Sometimes social welfare is thought to consist in military strength; sometimes in economic conditions; sometimes in artistic productiveness, and so forth. So also individual welfare is sometimes thought to consist in the possession of abundance of means of sensual enjoyment, or in physical prowess, or in intellectual power, or in social prestige, or in religious zeal, or what not. With regard to all these various ends, ethics can discover or attempt to discover, with the help of other sciences, whether when attained they have given permanent satisfaction; whether rather the attainment of many of these ends has not, as a rule, brought in its train misery which could have been avoided had the ends not been sought; whether such disappointment was due to accidental circumstances, or whether, human nature and human environment being what they are, such disappointment was inevitable; whether, if the latter alternative be true, any other end could have been pursued with reasonable chances of better success. But suppose all these questions answered and an end discovered which promises, when attained, to give satisfaction.

Even then it would be only the desire of men for such an end that could impose upon them the obligation to adopt the course of action necessary to attain it. Again, suppose such an end were a social end, and could not be realized within the lifetime of any now living, but could be attained in, say, 500 years. Whether the pursuit of that end would be undertaken or not would depend upon the relative strength of the desire for that future consummation and the desire for other objects that would necessarily be sacrificed in order to work for that consummation.

There is, however, another question that must be answered here: Is there no difference between what is actually desired and what is really desirable? Take the last case supposed. Granting that mankind at large did, when such an end was presented to it, reject it as too remote and too quixotically altruistic, and did set about to realize some other end, could it not be said that, in spite of the fact that the end is not desired, it is desirable? Or shall we have to say, with J. S. Mill, that "the sole evidence it is possible to produce that anything is desirable is that people actually desire it"? In answer it must be said that desired and desirable are different conceptions; that people often actually do desire what is undesirable; so that Mill's statement cannot be accepted as it stands. But there is a profound truth which the statement perhaps attempts, but fails to express. The statement must be amended. Nothing is desirable that is not desired, *or would not be desired if adequately known*. Thus, I may desire a certain fruit I see for the first time. Its color is tempting, its whole appearance makes a strong appeal to me to pluck it and eat it. But in spite of this the fruit may not be desirable. It may be deadly, or it may be extremely sour or astringent; or it may have a nauseating smell, which as yet I have not perceived. It would be desirable if I knew all about it and still desired it. It is a common experience that things eagerly desired are found afterward to be undesirable, and are then judged to have been undesirable all the time we were longing and striving for them. Thus, the measure of desirability is not the strength of the actual desire which persons have, but the desire they *would* have if they only knew the real bearing of these desires upon other things they are interested in.

Among the things that should be adequately known are the character and tendency of our future desires. A blind man may have no desire for fine paintings in his room. But if he knew that within a few years his blindness would be cured, and that then he would crave beautiful objects of sight, the knowledge would tend to make him now desire to have the pictures. Now, apply this answer to the supposed case that called forth the question. The welfare of society 500 years hence would have no value to men who were not genuinely unselfish, i.e., who desired only their own pleasures. But men do actually desire other things than pleasure, even when they know that these things cannot possibly bring them pleasure in the future. Many a disbeliever in immortality has earnestly desired and worked for some end which he knew could not be accomplished until long after his death. It is true that he would not have so worked for it if he had not at the time taken pleasure in the end; but he did not work for the sake of a future pleasure to come from a future realization of his plan. If the welfare

of humanity 500 years hence, when the idea of that welfare is clearly presented to now living men with all its bearings upon all their desires, did not arouse a desire to realize it, that welfare would not be desirable for *these* men. This difference thus described between the desired and the desirable also holds good between the preferred and the preferable. The preferable for any man is what he would prefer if he actually had all the information that was necessary for an intelligent preference. So also, finally, the supreme end, or *summum bonum*, for any man is that end which is for him preferable to any other. The nature of all his desires in their true interrelation and in their relation to the actual world in which he lives, determines the *summum bonum*, but he may not know what that *summum bonum* is, because he may not understand thoroughly either the world in its relations to the system of his desires, or the interrelation of his desires. In the sense that a science of ethics may, conceivably at least, throw light upon these questions, it may discover the *summum bonum*; but it cannot impose upon any man a *summum bonum* which is irrespective of his actual nature as a being with quite definite desires.

If the question is now asked whether ethicists have as yet come to any agreement as to the nature of the *summum bonum*, the answer must be No. However, the following description of the *summum bonum* is given, because it seems to do justice to all the determining factors of the problem. The *summum bonum* of any moral man is not any one single object. It is rather a progression of objects. The *summum bonum* is a serial system of ends which are, each in its turn, the most desirable ends capable of pursuit. An element in its desirability is that it shall fix favorable conditions for further pursuit of further desirable ends as well as give pleasure in the ends already attained. Again, because the normal man is a social man and thus interested in seeing at least some of his fellows obtain what is desirable for them, there is found among the ends included in the *summum bonum* the welfare of these fellowmen. By welfare is meant the progressive realization of the progressive *summum bonum* of each of these fellowmen. Now, the fact that the *summum bonum* of each normal man includes within itself the welfare of some other men constitutes a community of welfare. The question how many persons shall be included in the community of welfare is determined partly by objective conditions and partly by the actual reach of the benevolent emotions: by objective conditions, because no matter what may be my affectional attitude towards another man, it may be the case that unless he has his welfare he will be an impediment to my obtaining my welfare; by the actual reach of the benevolent emotions, as is proved by history, which shows that as men have become larger-hearted, the community of interests is shared in by a larger number of individuals. It must be borne in mind that the *summum bonum* thus described is not imposed upon any individual by any obligation. Unless an individual is so constituted that he finds such an end the most desirable of all ends, it is not his *summum bonum*. All that has been attempted is to describe in very general terms an end that it is believed will be found to be most desirable by normal human beings. Abnormal human beings, who have no liking for their kind,

or who are rabidly monomaniacal, or who in some other essential features vary from the kindly race of men, are not taken into account. Their *summa bona* are radically different, and because this is so there is apparently no possibility of welfare for them consistent with welfare for normal men. They are not included directly in the community of human interests. All that can be demanded for them is so much of welfare as is consistent with the welfare of mankind in general.

But though ethics as a science cannot impose an end on man, man individually and collectively can impose ends upon man to a certain extent. It is a fact, as we have already seen, that what a person shall desire is to a large extent determined by what other persons desire. A community or an individual with a definite conception of a supreme end can do much to influence a child or even an adult to desire that same end; and this makes moral training possible. Moral training and the teaching of ethical science are two quite distinct operations, although they may, and often do, go hand in hand. Moral training consists in an attempt to habituate a person to actions and dispositions such as are desired by the trainer. It is the process of initiating a person into a communion of ends with another person or with a group of persons. Ethical teaching is the process of bringing a person to see and understand the facts of the moral life. The former is an attempt to develop appreciations, the latter to develop insight. An appreciation without insight is blind; insight without appreciation is ineffective.

Moral training, however, is a fact in the moral life, and as such the investigation of it has a place in ethics as a science of the moral life. Ethics studies the facts of moral training and discovers whether the method adopted secures in the most effective way the end desired. It may ascertain, e.g., the fact that an actual particular kind of punishment is evil; that is, that instead of preventing crime it aggravates and multiplies it. Ethics may discover that other methods would avert these evil consequences and produce advantageous results, and it may discover the best means to the securing of these ends. All this is a matter of descriptive science, not in the least directly prescriptive. The beneficial ends are prescribed to men by their desire; the means are discovered by experience and experiment. A study of moral training shows that it is a very complex affair, and into its complexities we cannot here enter. Example and precept, admonition and chastisement, reward and "pious fraud," threats, actual infliction of pain, appeals to nascent desires and aversions, are all employed more or less frequently. All these instruments of moral training have their characteristic effect, and these must be experimentally ascertained. And again, not only moral training, but vengeance, is a phenomenon of the moral life. It aims at the infliction of pain on an offender to appease by his suffering the suffering of his victim or of the sympathizers of his victim. It has its characteristic results. These are studied by ethics. The results of this study may, as a fact do, secure general condemnation of such vengeful punishment; but this, again, is because the outcome of a vengeful policy is undesirable.

But there is a limit to what ethics as a science can do in securing acceptance of a common end. As we have seen, all that science can accom-

plish in this respect is to set forth different ends, the means to their attainment, and the consequences that would come from their attainment. Now, the fact is that different persons react differently to these proposed ends. Some want one realized, and some want another. Consequences that to some are revolting are desired by others. In such a case no amount of knowledge can decide the issue. We have here a conflict of ultimate ideals, and such a conflict can be decided only as all conflicts between unsympathetic interests are decided, viz., by struggle and the eventual victory of one over the other. In such a struggle argument does not play the decisive rôle. The appeal is to another tribunal, the tribunal of force. The force employed is not necessarily physical, although often it culminates in that. In a stable society the conflict is usually carried on by the use of such instrumentalities as persuasion, praise, and blame. Persuasion as opposed to argument is the process of arousing desires which shall supplant previous desires. Our desiderative natures are not something static, something we inherit and keep without change. Our desires are more or less pliable. We are liable to conversion, i.e., to a change in the whole bent of our longings. A powerful personality can incalculably modify the sentiments of a community. Thus, a struggle between antagonistic ideals is often a test of personal strength between its adherents, and more especially between the leaders. The cause that secures a magnetic leader has won half the battle. In persuasion praise and blame are employed. The desire for the approval of some outstanding personality is a mighty force in securing the adoption of a new ideal. The fear of such a man's blame will bring the vacillating into the fold. Once in, the followers become habituated to the new ideal and inculcate it upon their children. In this way, radiating from some one central person, a new ideal may sweep a nation or a continent. Of course, the social and the economic conditions must be ripe for the exercise of this personal influence, but in the last resort it is the personal influence that wins the battle. The moral ideals connected with the great historical religions secured their footing by such a process. Buddhism, Christianity, and Mohammedanism, as moral ideals, owe their ascendancy in large measure to the magnetism of their founders. Their spread was a personal victory.

But often resort is had to physical force. This is clearly instanced in the great change that took place when the practice of blood feud was replaced by the now current dispensation of justice by the state. In England, when the central government first took the control of criminal law into its hands, public sentiment was against the usurpation. The clan system had been in vogue for countless generations, and what thus had the sanction of immemorial usage was naturally regarded as just and moral. The encroachments of the crown were resented as unwarranted interference, and a struggle was precipitated. It was the physical strength of the crown as compared with the growing weakness of the clan that gave victory to the principle of state control. The will of the physically stronger formed the basis of the newer justice. In the course of time the sentiments of the community became adjusted to the new order of things, ideas of what was right came to be molded upon the practice which thus came to

prevail, and what a short time before was fought as an intolerable infringement is now regarded by most people as a self-evidencing right. The might of the state brought about the right of governmental penal control. The course of history is full of instances where victory in war established new moral ideals among the conquered. Even the moral ideals of many of the great religions have used physical force in their propaganda. Mohammedanism and Christianity have spread into many places by the agency of the sword; when established by might, time brought prescription, and subsequent generations accept loyally what their ancestors fought.

It is a great mistake to suppose that morality is a matter of pure intelligence. It is an exceedingly complex interest, and in the making of it all sorts of factors have played their part. For this reason moral history can never be predicted. European moral ideals owe their present existence to numerous battles that once hung in the balance, to economic changes unforeseen, to personal leaders whose advent was unheralded. Might—the might of personality, the might of economic conditions, the might of legions and battalions—has established the ideals which are now current and are regarded by their devotees as the expression of eternal right.

Few would perhaps question that such might has been instrumental in establishing ideals, but a distinction would be urged between the validity and the establishment of an ideal. Validity, it is often argued, is something that has its roots in the ultimate nature of reality, while the establishment of an ideal is a mere matter of history and subject to changing historical conditions. But such a distinction overlooks the fact that an ideal is in its very nature an appeal to inclination, to preferences, to loyalty. And the character of the persons to whom the appeal is made is integral to the constitution of the ideal as ideal. And character is not something that is immutable, but is subject to historical influences, so that the essence of an ideal as ideal is relative to the historical factors that determine character. The validity of an ideal is just its acceptance as an ideal, and its acceptance is its establishment where accepted. The only question, then, as to the validity of an ideal is its generality, i.e., the number of persons whom it engages in its service, and its durability, i.e., the length of time during which it succeeds in securing and keeping the loyalty of adherents.

This view of the relativity of ideals to historical conditions is often objected to on the ground that it is dangerous in practice. It tends, so it is urged, to take away from the moral ideal the stamp of finality, without which it could not pass current. It deprives it of the categorical authoritative character without which it could not maintain itself against personal inclination. The objection would hold good if morality were something independent of human interests, if the moral life were life in accordance with some standard not based on human desires and human satisfaction. The argument, in other words, begs the whole question. Those who hold to the relativity of morality necessarily must regard as humanly moral only what is humanly valuable, and a value does not lose its value for any one because it is recognized as what he with his particular emotional equipment holds dear. The dynamic of values is given to them by the very appeal they make to our interests, and so long as these

interests obtain the values remain values. Ideals would lose their grip on men who believe in the relativity of ideals only when these men also lose their interest in these ideals. So long as interests continue, the ideals that are constructed out of them will attract and control. And when interests die out, the allegation of the independence of an ideal will not bring them to life. The vigor of an ideal is fed, not by a theory of its origin, but by the experience of the effects of its operation or by the authority of those who impose it.

The possibility of the evolution of morality out of nonmoral conditions was some years ago seriously contested on metaphysical and theological grounds. The theological grounds do not concern us. The metaphysical grounds of objection are invalid. The strongest argument of the opponents of evolutionistic ethics is based on the necessity of self-consciousness for morality and on the alleged impossibility of the evolution of self-consciousness. The fallacy of this argument has been often pointed out. The "timelessness" of self-consciousness does not consist in the fact that the self has not a place in time as an event, but in the fact that the objects of that self's knowledge are not confined to the sensations of the present moment. The assertion that a consciousness in time cannot know time is an unfounded dogmatic dictum, and yet only on the supposition that this statement is true can it be maintained that consciousness and self-consciousness are in their nature incapable of explanation by evolution. The exact course taken in the evolution of morality from the nonmoral is still an open question; but the truth of the statement that morality is an evolved product stands or falls with the general truth of the evolution of man from the nonmoral animals.

The only other question that can be discussed here is that of free will in its bearing on morality. Can there be moral responsibility if the will is determined, i.e., if the volitions of man are events which find their complete causal explanations in previous events? In the light of what has been said it must be maintained that, unless human volitions were determined, responsibility would be impossible. Ethical responsibility is primarily the liability of a person to answer for his conduct before the bar of public opinion, whether that opinion be expressed in custom, religion, or law. A man commits an act and is held responsible. This means that he is subject to the demand of his fellows to prove that his act is in accord with the generally accepted plan of life, or that his variant plan is the right plan. Given an accepted plan, intelligent experience can determine the relation of an act to the realization of that plan. A reasonable person who adopts that plan may be constantly called upon to justify the means he takes to realize that end. Condemnation of an act in such a case means that it is recognized as not conducive to that end and that it is disliked as having that tendency. Approval means that it is recognized as conducive to that end and is liked as having that tendency. Or again, instead of raising a question of means to an end, there may be a question about the end. We have seen that, though the actual supreme end pursued is not imposed by reason, yet knowledge of the bearing of the attained end upon actual desires may lead to change of ends. Moral responsibility may mean the liability of a person to justify his supreme end, i.e., to show that it is

desirable as well as desired. Approval or condemnation of the end is a recognition of its desirableness or undesirableness, and the resulting affectional tone. It of course carries with it approval or disapproval of the means leading up to it. In ordinary life the supreme end is unreflectively pursued, and the means to it taken for granted as presented in some moral code. The only function of conscience in such cases is the approval or disapproval of an act as conforming to the moral code. In any case the whole activity of conscience is useless unless the judgments and feelings involved determine future conduct. Not only so, but also the past conduct judged, if conceived as wholly or in part the pure chance product of some blind arbitrary agent called "will," is not a means to any end, and therefore neither approvable nor condemnable as such. Now, free will, either in the sense of a liberty of indifference or a liberty of alternative choice, in so far as it is undetermined, is pure chance, as is conceded by Professor James, one of the most prominent supporters of indeterminism. Responsibility does not therefore presuppose indeterminism of the will, but it does presuppose that the will can be determined either by the knowledge of the conduciveness of a means to an end, or by the knowledge of the adaptedness of an end to satisfy a desire. A person who can by rational means be brought to see the inadequacy of his acts to the supreme moral end, or the inadequacy of his supreme moral end to his whole nature as a being with definite needs, is responsible; i.e., in case his acts or his ends are undesirable, he can be convinced of their undesirability and be led to condemn them. In other words, he has a conscience. When society holds a man responsible, it brings pressure to bear upon him to bring him or to keep him in accord with the socially recognized plan of life. Responsibility is, then, a means employed to maintain an organized society.

But we sometimes speak of a person as holding himself responsible. This happens when a person treats himself as subject to self-condemnation and self-approval. The social restraints and requirements are then not regarded as imposed by others, but rather as accepted loyally by himself, and in the light of this fealty freely given he judges his individual acts as self-justified or self-condemned. To hold oneself responsible is thus the attitude of a man who has risen to the level of freedom in social service. See DETERMINISM; FREE WILL; CUSTOM.

ETHIOPIA (Gk. *Aithiopia*, *Aithiopia*). The name given by the Greeks to a country south of Egypt variously conceived as including only Nubia (*Aithiopia Aegypti*), or Nubia, Sennar, Kordofan, and Abyssinia, or a region extending indefinitely east and west from the upper Nile, but applied after the fall of Meroë more particularly to Abyssinia. The vagueness of the term is largely due to the significance attached to it by the Greeks, who seem to have derived it from *aithēr*, *aithēr*, to burn, and *ōps*, *ōps*, face, and explained it as the country of sunburnt faces. Some scholars regard *Aithiopes* as an original Greek designation of the negroes. Others prefer to look upon it as an attempt by Greek folk etymology to extract a suitable sense from an unintelligible native name. It has been plausibly suggested by Glaser that this name may have been *Atyubyan*, incense gatherers, from *atyib*, pl. *atyub*, aromatics, and that this was the equivalent of *Habashat*, the Egyptian *Hbst*, the modern *Habesh*, or Abyssinia. In common use the name is given to the West African peoples of Nubia and Abyssinia (Ithiopian). Deniker (*Races of Man*, London, 1900) applies it to the third of his 29 human races, including Bejas and Gallas modified by

Arab blood among the Somalis. Abyssinians, etc., and by negro blood among the Zandeh and Fulbé. Keane (*Ethnology*, Cambridge, 1896), while relegating the Ethiopians to their proper place in the Hamitic section of the Caucasian division of man, names the generalized negro *Homo Ethiopius*. At least since the middle of the second millennium B.C. Eretria and the Somali coast were not unknown to the Egyptians. Through the expeditions of Queen Hatshepsut (c.1500 B.C.) down the Red Sea to Punt, the lands on both sides of Bab el Mandeb became more familiar than the territory on the upper Nile. Punt was looked upon as the land of the gods; while the products brought from there caused many a marvelous tale to be told of that country. That the people of Punt were not negroes, but belonged to the Mediterranean race, is quite evident from the pictorial representations. From accounts of them the Greeks may have derived their earliest notions of the men who lived in the farthest south. In the Homeric poems (*Odyssey*, i, 23 et seq.; *Iliad*, i, 423, xxvii, 206) the Ethiopians are represented as dwelling at the utmost limits of the earth and enjoying personal intercourse with the gods. This ideal picture is regarded by some scholars, not as an echo of the popular Egyptian conception of Punt or "the divine land," but as a reflection of the admiration felt in priestly circles in Egypt for the theocratic régime introduced by the Ammon priesthood in Napata during the Twenty-second Dynasty (960-774 B.C.). In Hesiod the term seems to be used vaguely of a territory south of Egypt and Libya. Herodotus (iii, 114) describes the Ethiopians as μακρόβιοι, long-lived, and regards their country as extending to the Southern Sea. This apparently implies that he includes Abyssinia, Eretria, and Somaliland. Later Greek writers use the term sometimes as a designation of Nubia, sometimes in a much wider sense. Historically there are three distinct kingdoms known as Ethiopia—those of Napata, Meroë, and Aksum. There is no definite evidence that either of these included at any time all the territory between the southern border of Egypt and Bab el Mandeb. Only the Kingdom of Aksum seems to have claimed the name Ethiopia; in the case of the others it was apparently a Greek and Roman designation solely.

Kingdom of Napata. For a description of that part of the Nile valley which was ruled from Napata, see NUBIA, and for the city itself, see BARKAL and NAPATA. Already in predynastic times a certain civilization seems to have existed in Nubia. Reisner has recently discovered that the culture of Nagada and Abydos (see EGYPT) extended a considerable distance beyond the First Cataract. The Egyptians of the Old Empire had relations with their southern neighbors. From the forests of Nubia (*Knst*) they obtained a large proportion of their timber, and the city of Yeb (Elephantine) derived its name from the ivory which found its way to this place from the interior of Africa. King Unas (c.3290-3260 B.C.) employed warriors belonging to six Nubian tribes in his war upon the Bedouins. The early pictorial representations of Nubian archers do not suggest that they were negroes. A regular conquest of the country south of Syene (see ASSUAN) apparently was not undertaken until the Twelfth Dynasty (c.2522-2323). The most powerful Nubian people at this time was Kash or Kosh,

the Hebrew Cush (q.v.). The ethnic relations of this people cannot be determined with certainty. But it is probable that the stock was originally Hamitic, though in course of time it absorbed various Negritic tribes. Kosh is first found on a stele of Sesostris I. Sesostris III established his frontier north of the Second Cataract, and built for its protection two forts at Semneh and Kummeh on opposite sides of the river. Whether the Hyksos kings ever held possession of this territory is doubtful. At any rate, it had to be reorganized by Aahmes (1575-53), the founder of the Eighteenth Dynasty, and his successors. Napata probably had been the capital of the independent kingdom, since it was made the residence of the viceroy, entitled "Prince of Kosh," who governed the new Egyptian province. In the time of Ramses II (1310-1244) there may have been an unsuccessful rebellion. The high priest of Ammon-Ré in Thebes, Herihor, in the beginning of the eleventh century, proclaimed himself "King of Upper and Lower Egypt." This his successors in the pontificate were not able to do, but seem to have recognized the Tanitic Dynasty. But a branch of the family established itself at Napata, probably at the end of that dynasty (c.1000). In the Twenty-second Dynasty (960-774) these kings threatened the border of Egypt. One of them, Pianchi I, who seems to have reigned in Napata after 777, availed himself of the weakness of Egypt at the end of the reign of Uasarken III (c.762-756) to make an invasion of Egypt. He defeated 20 petty rulers and made a treaty with Tefnacht of Sais in 756 B.C. After his death (746) Kashta (c.746-734) and Pianchi II (c.734-715) were apparently not capable of maintaining any control of Egypt. But the grandson of Pianchi I, Shabaka (715-703), united all Egypt with Ethiopia under one crown. Whether this King is identical with So, the ally of Hosea of Israel, is still doubtful. His successor, Shabataka (703-691), was dethroned by Taharka (691-664). In his time Esarhaddon of Assyria invaded Egypt in 673 and again in 670, when Memphis was taken. On a stele found at Zenjirli in northern Syria Esarhaddon's triumph over Taharka is represented. Taharka was driven back into Ethiopia. Tandamane, or Tanuat Ammon (664-663), tried in vain to reconquer Egypt, where, on the decline of the Assyrian power, Psammetichus I (663-610) made himself ruler. During the reign of this Egyptian King, Herodotus states, a large number of dissatisfied soldiers emigrated into Ethiopia. The place where they settled cannot be determined with certainty, though it has been suggested that the island of Meroë may have received many of them, and their number (240,000) has, no doubt, been exaggerated by Herodotus (ii, 30). An invasion of Ethiopia was probably made by Psammetichus II (594-588), referred to in the Greek inscriptions of Abu Simbel. From the native inscriptions which are now being deciphered it may be inferred that Tandamane continued to reign in Napata until 650. Later monarchs were Asperta (c.630-600), Panchirer (600-560), Harsiotf (560-525), and Nastasen (525-500). The stele of Harsiotf shows that this King conquered several provinces south of Meroë and built many temples. Cambyses invaded the country in 524; but the stele of Nastasen tells of his destroying Cambyses' fleet. The capital was moved to Meroë, but Napata

continued to be an important religious centre. Many temples have been discovered by recent explorers in the territory of this kingdom. See **SUDAN**.

Kingdom of Meroë. On the capital of the new kingdom that gradually arose in the south, see **MEROË**, and for a description of territories that at one time or another formed a part of it, see **SENNAR** and **KORDOFAN**. The Achæmænian monarchs received tribute from kings who seem to have made Meroë their capital. Some of these kings seem to have been of the old line. It is possible that Nastasen's successors made conquests in northwestern Abyssinia. While the theocratic constitution described by Greek writers no doubt had developed already in Napata, the subordination of the King to the priesthood seems to point to a new régime, in which the King was a mere tool in the hands of the clergy. While the suzerainty of the Ptolemies seems to have been recognized for religious reasons, King Ergamenes, by putting to death the priests who had demanded that he should abdicate in the time of Ptolemy IV Philopator (221-204), paved the way for independence. Ptolemy V Epiphanes (204-181) was able to resist his attack upon Egypt, but not to prevent his assertion of sovereignty in Ethiopia. Queen Candace seems to have extended her power in the north, and 25 provinces are said to have been tributary to her. But her invasion of Egypt was successfully resisted by Caius Petronius in 24 B.C. Napata, that had been rebuilt, was destroyed by the Romans. Another Queen Candace is mentioned in Acts viii. The name of Candace has been found on a pyramid at Meroë. But gradually Meroë itself fell into ruins. To guard against invasion by the Blemmyans, a people akin to the Bugaita, the modern Beja, Diocletian moved the Nobata, negro tribes of the same stock as the population of Kordofan, from the oasis of Khargeh into the Nile valley. In the sixth century A.D. the Christian Kingdom of Dongola (q.v.) was founded. See **NUBIA**.

Kingdom of Aksum. The mountain region of Abyssinia was probably inhabited in very early times by Semites as well as by Hamites. Whether the original home of the former was in Africa or in Arabia (see **SEMITES**), the overflow of population would naturally set in the direction of this Alpine country. As the native name shows, the Semitic Ethiopians were still in the nomadic state when they entered this territory, priding themselves on being "wanderers" roaming freely wherever they liked. (See **GEEZ**.) There were evidently successive waves of immigration. If the Egyptian Hst is of Semitic origin, as can scarcely be doubted, there were apparently kinsmen of the Yemenites in Eretria and on the Somali coast c.1500 B.C. Sabæan inscriptions found in Yeha, the ancient Awa, may be as old as the seventh century B.C. Names of places such as Alwa, Daro, Sant, Harar, Hasak, and Awa are manifestly of South Arabian origin and seem to indicate a trade route between Yemen and Meroë lined with Semitic settlements long before the Christian era. As long as the Ptolemies dominated the Erythrean coast from Adulis, Berenice, and Arsinoë, a strong Abyssinian kingdom could not well develop. But in the reign of Augustus, when the Romans suffered serious reverses in Arabia and were occupied in Africa with Queen Candace, while the Arsacid conquests in eastern Arabia forced the Yemenite states

to seek compensation for their losses elsewhere, the Semitic element in Ethiopia seems to have been reinforced, and the Kingdom of Aksum founded. The *Periplus Maris Erythraei*, possibly written by Basiles between 56 and 67 A.D., refers to a king of Aksum by the name of Zoscales, who controlled the coast from Massowah to Bab el Mandeb and was a friend of Greek culture. It is possible that some of the gold coins with Greek legends that have been preserved should be assigned to the second and third centuries A.D. Ten kings are known through these coins, viz., Aphilas, Bachasa, Gersam, Uzas, Nezana, or Aizana, Ulzeba, Azael, Uchsas, and Esbaal, or Aicb. Those that have the mark of the cross are clearly from the fourth and following centuries, but those without such a mark are probably earlier. On a marble throne in Adulis, Cosmas Indicopleustes in 545 A.D. found and copied an inscription commemorating the power of a great king whose name is not given. He has been supposed by some scholars to be the founder of the Aksumite kingdom, but it is more probable that he reigned at the end of the third century A.D. He possessed a part of southwest Arabia and fought with the Kasa (Cush) and the Buga (Beja). The Γάζα ἔθνη that he mentions as his subjects are probably the Agazi or Geez tribes. King Aizana is known to have reigned in the year 356 A.D. A trilingual inscription (Greek, Sabæan, and Geez) belongs to his pagan period; an inscription in Geez comes from his Christian period. For in his time Frumentius (q.v.) preached Christianity in the country. The political relations that had long existed between Aksum and Rome were such as to favor his mission. Ela Amida, his successor, who reigned before 378, still held control of parts of Yemen. One of the two Rüppell inscriptions written in the peculiar vocalized writing of the Geez (see **ETHIOPIC WRITING**) probably belongs to his reign. In 378 Aksum was reduced to its African territory. The names of some kings of the next century may be represented on the coins. Only a few can be deciphered with any degree of certainty on the copper coins, viz., Mehigsen, King of Aksum; Hatasu, King of Aksum; King Elaats; and King Zwasan. In 525 A.D. Elesbaha, King of Aksum, with the aid of the Sabæan and Hadramautian rulers, made an end to the Himyarite Kingdom of Dhu Nuwas, and Ethiopia again controlled Arabian territory. Before the end of the century, however, the Aksumites were driven back to Africa and never again extended their conquests to Arabia. In the seventh century Abraha gave refuge to the followers of Mohammed; and in 687 there was war between Aksum and Nubia. According to a letter addressed by a king of Aksum to a king of Nubia in the time of the Patriarch Philotheus of Alexandria (980-1002), preserved in a fourteenth-century *Life of the Patriarchs* and in the Ethiopic *Synaxar*, a woman who reigned over the Beni el Hamuna had recently invaded the country, burned churches and monasteries, and driven him from place to place. Marianus Victor (1552) speaks of this woman as the founder of the Zagwe Dynasty and as having married a ruler of the Province of Bugna. Later legends made of her a Jewess. She was probably a queen of the reigning family who married a prince of the Beni el Baguna, a name afterward corrupted into Beni el Zagwe. Eleven kings of the so-called Zagwe Dynasty reigned until 1270.

The most famous of these is Lalibula (c.1200 A.D.). In 1270 Yekuno Amlak restored the old line. Yekuno Amlak removed his residence to Tegalet in Shoa, but Aksum still remained the city where the kings were crowned. His successor was Wedem Raad (1291-1314). Amda Sion (1314-44) was a powerful king who fought bravely with his Muslim neighbors. Saifa Arad (1344-72) carried on a successful war in Upper Egypt against the Sultan on behalf of the Patriarch of Alexandria. His successors were Wedem Asfare (1372-82), and his brother, Dawit I (1382-1411), Teodoros I (1411-15), Yishak (1415-30), Andrias (1430), Takla Maryam (1430-34). Zara Yakob (1434-68) was a brave warrior and an able administrator. He was followed by Baeda Maryam (1468-78) and Eskander, or Alexander (1478-95), in whose time Cavilham visited the country. Amda Sion II (1495) and Naod (1495-1508) were of less importance. But Dawit II, called Lebna Dengel, in his battles with Adal showed himself to be a good soldier. Asnaf Sagad (1540-59) conquered Ahmed Granje, King of Adal, but in his reign the Gallas invaded the country. After the reign of Minas (1559-63) Sarsa Dengel came upon the throne (1563-97). This monarch destroyed Adal and fought successfully with the Gallas. In the time of his successors, Yakob (1597-1603, 1604-07), Za Dengel (1603-04), Susneus (1607-32), and Fasiladas (1632-67), religious difficulties occupied much attention. The power of the following kings was greatly limited by the Galla chiefs that ruled in many districts. They were: Johannes (1667-82), Jasus I (1682-1706), Takla Haimanot I (1706-08), Theophilus (1708-11), Justus (1711-16), Dawit III (1716-21), Bakafa (1721-30), Jasus II (1730-55), Joas (1755-69), Johannes II (1769), Takla Haimanot II (1769-77). On the more recent history see ABYSSINIA.

Ethiopic Language. The earliest monuments of Semitic speech in Ethiopia are the inscriptions found at Yeha. These are written in the consonantal Sabaean script. But while the presence of the article *an* appended to the noun and a final *m* to show indetermination is a sign of close affinity to the Sabaean, both syntax and vocabulary indicate that the writers used the *lesana Geez*, the language of Semitic Ethiopia, possibly as early as the seventh century B.C. The bilingual inscription (Greek and Ethiopic) exhibits essentially the same speech. So far as the language is concerned, there is not much difference between it and the Rüppell inscriptions which are written in the syllabic script characteristic of Ethiopic manuscripts. These Aksum monuments present the same type of language as the literary documents. Geez probably continued to be spoken by the common people until the Zagwe Dynasty came into power. From that time the Amharic probably began to gain upon the classical tongue. Yekuno Amlak, in 1270, made the former the official language, and Geez henceforth became the language of books and of the church, and as such had a second flourishing period. In its general structure and vocabulary Geez is closer to the Sabaean than to classical Arabic, but in some respects it has features that are younger than the latter. Thus the case endings have disappeared; the old passive is lost; aspirated dentals are changed into sibilants. Geez appears to have dropped the article some time before our era. As a substitute anticipating suffixes are used as in Ara-

maic, and also demonstrative pronouns. Of a dual there are only a few remnants. The verb has a simple stem, a causative formed by a prefixed *a*, a second causative in *as*, a reflexive in *ta*, another in *an*, and a third in *tam*, and a causative reflexive in *ast*, each of these permitting five vowel changes to indicate shades of meaning. The indicative and the subjunctive of the imperfect are strictly distinguished. The vocabulary has been greatly enlarged by Hamitic words. There are also some Greek and Aramaic loan words. Geez is to-day represented by two dialects, Tigre and Tigräi, or Tigrina. The latter is spoken in Tigre and has been much influenced by the Amharic; the former is spoken in the districts north and northwest of Tigre and shows greater similarity to the old Geez. Amharic has developed many peculiarities not found in any other Semitic language, but characteristic of the Hamitic languages.

Ethiopic Literature. Reference has already been made to the early inscriptions. On the translation of the Bible, see under BIBLE, the section on *Versions*. The Ethiopic Old Testament contains, in addition to the canonical books, also the Apocrypha (except the Books of Maccabees), and a number of works, such as the Book of Enoch, the Ascension of Isaiah, the Book of Jubilees, and the Apocalypse of Ezra. These additions have all been published; but many of the canonical books are extant only in manuscripts. Several apocryphal books are also appended to the New Testament, among them a *Synodos*, which includes canons of councils, an exposition of the Nicene Creed, apostolic constitutions, and other matter. The remaining literature is mainly theological, and includes translations of Greek fathers, liturgies, lives of saints, monastic rules, hymns, and the like. A so-called *Antiphonary* contains a musical notation. The *Savasev* are very imperfect studies of the language. Catalogues of the principal collections have been published.

ETHIOPIAN CHURCH. See ABYSSINIAN CHURCH.

ETHIOPIANISM. The name given to a movement in South Africa which under the guise of religious teaching preaches the overthrow of white domination, or "Africa for the Africans." It was started about 24 years ago by two native ministers who seceded from the Wesleyan body and started the Church of Ethiopia, exclusively for blacks. One of the two, named Dwane, visited the United States and obtained for his organization the recognition of the powerful African Methodist Episcopal church, the affiliation being confirmed when Bishop Turner visited Africa in 1898 and ordained a large number of Kafir ministers. Dwane subsequently approached the Archbishop of Capetown, seeking some kind of affiliation with the Anglican church, and from this grew an obscure recognition of what is called the Order of Ethiopia. To counteract this schism the African Methodist Episcopal church in America sent out Dr. Levi Coppin, of Philadelphia, as Bishop of its South African branch, which has become firmly established and is absorbing the native converts of the English Methodist missions. In addition the Transvaal mines, in bringing together thousands of native laborers from every part of Africa south of the Zambesi, have served to further the sentiment of a community of interest among the Kafir population. The Herero uprising of 1904 and the Zulu outbreak of 1906 in Natal are supposed to have been influenced by Ethiopian agitators. Since that time, however, little or nothing has been heard from this movement.

ETHIOPIAN PEPPER. See GUINEA PEPPER.

ETHIOPIAN REGION. In zoögeography, Africa south of the Sahara, and including Madagascar, i.e., the Paletropical Region (q.v.). See DISTRIBUTION OF ANIMALS.

ETHIOPIA. See ETHIOPIA; ETHIOPIC LANGUAGE; ETHIOPIC LITERATURE; ETHIOPIC WRITING.

ETHIOPIC VERSION. See BIBLE.

ETHIOPIC WRITING. The language of the Semitic Ethiopians, the *lesana Geez* (see GEEZ), was at first written in the same characters that were used by the Minaeans and Sabaeans. The origin of this South Arabian system of writing is still obscure. While some epigraphists regard it as a modification of the Phœnician alphabet, others are inclined to ascribe to it an independent origin. (See ALPHABET; MINAEANS.) The earliest Ethiopic inscriptions are written *boustrophedon*, i.e., as the ox plows—one line running from right to left, the next from left to right. Later the direction from left to right prevailed, as in the Greek. Probably in the fourth century the Sabæan alphabet was modified by the introduction of a peculiar method of vowel notation. The various long or short vowel sounds were indicated by a lengthening or shortening of certain strokes or the addition of a stroke, a hook, or a circle. The signs thus became designations of syllables, and by 182 characters it was possible to express clearly the

pronunciation of each word. It has been supposed by some scholars that this was an imitation of the Syriac vowel system. But the date of the Rüppell inscriptions renders it more probable that the changes were suggested by missionaries familiar with the Indian *brahma lipi* or *karoshthi* alphabets. Consult Dillmann, *Grammatik der äthiopischen Sprache* (2d ed., by Bezold, Leipzig, 1899).

ETHIOPS (Lat., from Gk. *ἠθίοψ*, *Aithiops*, Ethiopian; so called from the color), or **ÆTHIOPS**. A term applied by alchemists to certain black oxides and sulphides that were used in medicine. *Martial ethiops*, or black oxide, a ferrous and ferric oxide prepared by keeping iron filings under water, was used as a tonic. *Mineral ethiops*, mercuric sulphide with an excess of sulphur, was made by mixing together equal parts of mercury and sulphur in a stone-ware mortar and was used as a vermifuge and alterative. *Ethiops per se* was made by agitating mercury with access to the air. *Teyctable ethiops*, the plant bladder wrack heated in a closed vessel until it became black, was used as a remedy for scrofula and similar diseases.

ETHMOID BONE (Gk. *ἠθμοειδής*, *ēthmoeidēs*, like a sieve, from *ἠθμός*, *ēthmos*, sieve, from *ἔθειν*, *ēthein*, to sift + *εἶδος*, *eîdos*, form). One of the eight bones which collectively form the cavity of the cranium. It is of a somewhat cubical form and is situated between the two orbits of the eyes, at the root of the nose. Its upper surface is perforated by a number of small openings (whence its name), through which the filaments of the olfactory nerve pass downward from the interior of the skull to the upper part of the nose. It consists of two lateral masses, attached on each side of a vertical central plate, or lamella, which articulates with the vomer and with the central fibrocartilage, and thus assists in forming the septum or partition between the two nostrils. Each of the lateral masses is made up of two scrolls (turbينات) and is so planned as to give in a small space a very large amount of surface, on which the filaments of the olfactory nerve are spread. See NOSE; SNAEL.

ETHNIC PSYCHOLOGY. See PSYCHOLOGY, ETHNIC.

ETHNOGRAPHY (from Gk. *ἔθνος*, *ethnos*, people + *-γραφία*, *-graphia*, description, from *γράφειν*, *graphein*, to write). That branch of anthropology which is concerned with the systematic description of races and peoples. SEE ETHNOLOGY.

ETHNOLOGY (from Gk. *ἔθνος*, *ethnos*, people + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). Though formerly ethnology and ethnography were two distinct sciences, the present tendency in America is to use "ethnology" as including all studies of living races, thus making it one of the three main branches of anthropology. "Ethnography" appears in literature at the beginning of the last century as synonymous with a description of nations or peoples. "Ethnology" seems to have first appeared in the title of the Society of Ethnology of Paris in 1839, where it was used to include all studies of living races. Both terms became current in France, England, and Germany, where a distinction was finally made, "ethnography" being used to designate the systematic descriptions of the various groups of nonhistorical peoples, "ethnology" the synthetic and analytic uses of the data so acquired to determine the classification

of peoples, the causes leading to changes of culture, etc. According to this use of the two terms, the physical or anatomical characters as employed in the classification of races fell within the domain of ethnology, as also classification by languages. However, the specialized nature and complexity of problems arising from the study of man's physical characters soon brought about a differentiation which ultimately led to the recognition of physical anthropology as a distinct science. In recent years for similar reasons the study of languages has been recognized as equally distinct. (See ANTHROPOLOGY.) Hence American anthropologists now use the term "ethnology" as the collective name for all studies of living nonhistorical peoples exclusive of language and anatomy. Yet these distinctions are not absolute, for all are but the subdivisions of one science, anthropology.

The ethnology of a tribe should include full descriptive data upon the following:

1. *Habitat*. Location, movements, geographical environment, and history.

2. *Material Culture*. Food, shelter, transportation, dress, manufactures, and industrial arts.

3. *Art*. Graphic art, decorations of all kinds, symbolic interpretation of designs, religious art.

4. *Social and Political Organization*. Marriage customs, social groups, division of labor, property, government, regulation of health, education, social ideals, war, games and amusements, burial customs.

5. *Religion and Ceremonies*. Religious concepts, ideas of the world, assumed supernatural relations, shamanistic practices, enumeration and description of all ceremonies, songs (dancing and music).

6. *Mythology*. Recorded folk tales and sayings.

To this should be added a general comparative statement showing the relation of the tribal culture to the cultures of its neighbors and such conclusions as the data warrant on the origin and historic development of the most important traits.

Certain general problems are the particular concern of ethnologists, though all such are likely to transcend the strict bounds of ethnology and become truly anthropological problems; among these are the significance of clan and other family systems, the existence or nonexistence of important mental differences among the various divisions of mankind, the relation of culture to environment, and the manner in which cultures evolve. See ANTHROPOLOGY; MAN, SCIENCE OF. Consult: E. B. Tylor, *Primitive Culture* (2 vols., New York, 1891); F. Ratzel, *History of Mankind* (3 vols., ib., 1904); J. Deniker, *The Races of Man* (London, 1900); A. H. Keane, *Ethnology* (2d ed., New York, 1906) and *Man Past and Present* (ib., 1900); F. Boas, *The Mind of Primitive Man* (ib., 1911); for an extensive bibliography, see W. I. Thomas, *Source Book for Social Origins* (Chicago, 1909). See the paragraphs *Ethnology* under the names of countries.

ETHNOLOGY, BUREAU OF AMERICAN. See SMITHSONIAN INSTITUTION.

ETHOLOGY. See BIONOMICS.

ETHYL (from *eth-er* + *-yl*), C_2H_5 . A radical, or group of atoms, often found in chemical compounds of carbon, but incapable of independent existence. See CHEMISTRY (section on

the *History of Chemistry*) and CARBON COMPOUNDS.

ETHYLAMINE (from *ethyl* + *-amine*, from *am-mon-ia* + *-ine*), $C_2H_5NH_2$. An organic base produced when a monohalogen substitution product of the hydrocarbon ethane is heated with a solution of ammonia in alcohol. The most convenient method of preparing ethylamine consists in gently warming propionamide ($C_2H_5CONH_2$, the amide of propionic acid) with bromine and an excess of caustic potash, the transformation taking place in two steps, according to the following chemical equations:

Ethylamine is a colorless, inflammable liquid boiling at 18.7° . It resembles ordinary ammonia in odor and in other properties, combines with acids to form crystalline salts, and forms double salts with the chlorides of gold, platinum, etc. When treated with nitrous acid, it is changed to alcohol; and when warmed with chloroform and caustic potash, it is converted into ethyl isocyanide (a carbylamine having the formula C_2H_5NC), which may be readily recognized by its extremely disagreeable odor. See also AMINES.

ETHYLENE (from *ethyl* + *-ene*), or OLEFIANT GAS, C_2H_4 . A gaseous compound of carbon and hydrogen having a peculiar sweetish odor. It is colorless and but sparingly soluble in water. In the presence of "platinum black" (finely divided platinum), it combines with hydrogen to form the hydrocarbon ethane. Ethylene is formed in the dry distillation of coal and is therefore one of the constituents of ordinary illuminating gas, to whose flame it imparts considerable luminosity. It is prepared in chemical laboratories by heating a mixture of strong alcohol and concentrated sulphuric acid, the alcohol being thus broken up into water and ethylene. Senderens showed, in 1910, that the yield of ethylene is materially increased if some aluminium sulphate is added to the sulphuric acid.

Ethylene is one of those carbon compounds that are capable of combining directly with the halogens, forming "additive products": thus, with bromine it forms the compound $C_2H_4Br_2$. It is therefore classed with the so-called unsaturated compounds, of which it is the simplest representative. It similarly combines with hydrobromic acid (especially in the presence of aluminium bromide), forming ethyl bromide, C_2H_5Br , and with hydriodic acid, forming ethyl iodide, C_2H_5I . See DUTCH LIQUID.

ETHYLENE DICHLORIDE. See DUTCH LIQUID.

ETHYL NITRATE. See NITROUS ETHER.

ÉTIENNE, *At'yèn'*. See STEPHANUS.

ÉTIENNE, CHARLES GUILLAUME (1778-1845). A French playwright and journalist, born near Saint-Dizier, Haute Marne, France. During the Revolution he held several municipal offices. As secretary to Hugues Bernard Maret, Duc de Bassano, he participated in Napoleon's campaigns in Italy, Germany, Poland,

and Austria. His comedy *Les deux gendres* (1810) gained his election to the Academy in 1811, but it was also the subject of a bitter controversy, for Étienne was charged with plagiarism. He was editor in chief of the *Journal de l'Empire*. His works include: *Le rêve* (1799); *Histoire du théâtre français* (4 vols., 1802), with Alphonse Dieudonné Martainville; *La jeune femme* (1804); *Brueys et Palaprat* (1807); *Cendrillon* (1810); *L'Intrigante* (1812); *Joconde* (1814).

ÉTIENNE DU MONT, á'tyèn' du môn, SAINT (Fr., St. Stephen of the Mount). One of the most beautiful churches of old Paris, founded in 1220 and rebuilt from 1517, but not completed till 1626. It has a beautiful carved bridgelike choir screen in stone (end of sixteenth century), a feature which is unique in Paris. The church contains the shrine of St. Genevieve, dating from the thirteenth century, and is the burial place of Pascal and Racine.

ETIOLATION (from Fr. *étioier*, to blanch, OF., *estioler*, from *esteole*, stubble, from Lat. *stipula*, straw). The change in appearance and structure of the plant caused by growth in absence of light. Chlorophyll is lacking in etiolated dicotyls and monocotyls, and its absence makes the yellow pigment carotin (q.v.) (formerly called etioline) evident. The structural modifications are of much more significance and are marked by elongation of internodes and petioles, reduction in size and differentiation of the leaf blade, and by lack of development of mechanical tissue. The elongation of the internode more commonly occurs in dicotyls and that of the petiole in monocotyls; hence the two types are termed respectively dicotyledonous and monocotyledonous. Red light, free from blue or violet rays, produces all the etiolation effects except lack of chlorophyll. It is seen, then, that the more refrangible portion of the spectrum is the important portion in determining growth and structural modifications in plants. Etiolation is not limited to monocotyls and dicotyls, but appears in gymnosperms, ferns, mosses, algae, and fungi.

ETIOLIN (from Fr. *étioier*, to blanch). A name formerly given to the carotin (q.v.) appearing in etiolated plant structures.

ETIQUETTE, ét'két (OF. *estiquette*, *etiquette*, Fr. *étiquette*, from OHG. *stehhan*, Ger. *stechen*, to stick). Originally etiquette signified a slip of paper—ticket, label—affixed to a bag or other object to indicate its contents. The word came to possess the secondary meaning which we now attach to it—of "prescribed routine," or the various decorums observed in the intercourse of life, more particularly on state occasions—seemingly from the old custom of delivering such tickets, instructing each person who was to share in a ceremony as to the part he or she was expected to play in it. The cards on which the order of the dances is set forth at balls and evening parties are of this nature. The word is much used in certain professions the members of which are in honor bound to observe particular unwritten codes of conduct upholding the dignity of their respective callings. Thus, we have "medical etiquette," "legal etiquette," etc.

ETIQUETTE, á'té'két', MADAME. The popular name applied to the Duchess de Noailles from her rigid application of formalities as mistress of ceremonies at Marie Antoinette's court.

ETIVE, ét'iv. A sea loch in the north of Argyllshire, Scotland, running inland from the Firth of Lorne (Map: Scotland, C 3). The river Awe, the outlet of Loch Awe, and the small river Etive flow into it. The loch abounds in salmon. The scenery around the upper half of the loch is mountainous and romantic. The ruins of Ardoch Priory and of Dunstaffnage Castle add to its interest.

ET'LAR, CARIT. See BROSBÖLL, JOHAN CARL CHRISTIAN.

ET'NA, or **MONGIBELLO**, môn'jé-bél'lo (Lat. *Ætna*). The largest active volcano in Europe. It is an isolated mountain on the eastern coast of Sicily near the city of Catania. It is cut off from the surrounding mountains on the north by the valley of the Alcantara and on the south and southwest by the valley of the Simento. Its eastern side rises directly from the Mediterranean, which here has a depth of 5000 to 6000 feet. The base of the volcano measures about 90 miles in circumference. The ascent, gradual at first, leads with increasing slope to the summit, about 10,758 feet above the sea. The general appearance of Etna is that of a massive lava cone, whose regularity of outline is broken by fissures and by numerous subsidiary cones. Of the latter there are more than 200 located at irregular intervals on the mountain sides, some reaching a height of 700 feet. The cone occupied by the present principal crater rests upon a terrace which marks the site of an ancient larger cone that was probably destroyed by an explosion. On the eastern slope is a vast amphitheatre called the Val del Bove, with precipitous sides nearly 3000 feet high, which was once the centre of eruption and which affords a remarkable view of the volcano's structure and its development during the repeated eruptions. The summit of Etna, except where covered with snow, presents a dreary waste of dark lava, scoria, and ashes. Lower down there is a stretch of woodland with pine, oak, beech, and poplar. A varying breadth of from 2 to 11 miles of cultivated region surrounds its base, producing grain, oil, wine, fruit, and aromatic herbs. Snow persists throughout the year in the fissures of the summits, and on the exposed portions for about eight months. An observatory and a house for the convenience of travelers have been erected on the terrace just beneath the crater.

The eruptions of Etna are on a grander scale than those of Vesuvius, but they are not of so frequent occurrence. There are records of 11 eruptions previous to the Christian era, the first occurring in 476 or 477 B.C. The most remarkable in later times are the following: the eruption of 1169 A.D., when Catania and 15,000 of its inhabitants were destroyed; that of 1527, when two villages were buried and many human beings perished; that of 1669, when the flow of lava was directed again towards Catania and is said to have killed 20,000 people; and the eruption of 1693, when a still larger number of people are said to have been destroyed. A violent eruption took place in 1852, and immense quantities of volcanic dust fell over the adjacent country. Great torrents of lava also issued from two new fissures on the eastern flank, one of which was nearly 2 miles in length. The next outbreak, in 1864-65, was of trifling importance. That of May, 1879, was much more violent, the clouds of smoke and showers of ashes being followed by the ejection of a stream

of lava which desolated a large tract of highly cultivated land. Eruptions occurred in 1886 and 1892 and a violent outbreak in 1911, when a stream of lava, one-third of a mile wide, flowed down the northeastern slope towards the Alcantara valley. The last eruption was accompanied by the formation of several new craters. See SICILY.

ETNA. A borough in Allegheny Co., Pa., on the Allegheny River, opposite Pittsburgh, and on the Baltimore and Ohio and the Pennsylvania railroads (Map: Pennsylvania, B 6). It is a flourishing industrial centre and has rolling mills, furnaces, steel mills, galvanized-pipe works, and other manufactures. The water works and electric-light plant are owned by the borough. Pop., 1900, 5384; 1910, 5830.

ETON. A town in Buckinghamshire, England, in the parliamentary borough of Windsor, on the left bank of the Thames, 42 miles south-southeast of Buckingham and 22 miles west of London (Map: London, E 1). It lies opposite Windsor in Berkshire, with which it is connected by a bridge over the Thames. Eton chiefly consists of one long, well-paved street, is lighted by electricity, and has a modernized sewerage system. It derives its importance from the ancient and famous Eton College (q.v.). Pop., 1901, 3301, 1911, 3192.

ETON COLLEGE. One of the oldest and most famous public schools in England. It was founded in 1440 by Henry VI as "The College of the Blessed Mary of Eton beside Windsor." The establishment was constituted for a provost, 10 priests, 4 clerks, 6 choristers, 25 poor grammar scholars, a master, and 25 poor infirm men, and was provided for out of the royal demesne lands and the estates of certain alien priories. The whole plan was modeled on that of Winchester and contemplated a connection between Eton and King's College (q.v.), Cambridge, such as existed between Winchester and New College, Oxford. In 1441 a supplementary charter was granted to the new foundation, and the college buildings were begun, but were not entirely finished until 1523. The first head master of the school, later one of its most munificent benefactors, was Bishop Waynflete (q.v.). The college has had a long and honorable history. Its roll of worthies comprises many great names, especially during the eighteenth century. It includes Sir Robert Walpole, Robert Harley (Earl of Oxford), Henry St. John (Viscount Bolingbroke), the elder Pitt, Lord North, Charles James Fox, Horace Walpole, the Duke of Wellington, the poets Gray and Shelley, and Gladstone. The increasing value of the estates of the college, together with additional gifts, has made it very wealthy. By the Public Schools Act of 1868 the original foundation was greatly modified. The governing body now consists of a provost and 10 fellows, nominated by an electorate, which includes such bodies as Oxford and Cambridge universities. There are a number of scholarships besides those on the regular foundation, and the plan of connecting Eton with King's College was so far carried out that a number of scholarships at the Cambridge college are exclusively for Eton men. There are 72 scholars on the foundation. The total number of pupils in the college in 1913 was 1019; the nonscholars, a class admitted very early in the history of the institution, are known as "oppidans," who may, and in a very few cases do, live out of the college. There are

two schools, an upper for the older boys and a lower for the younger, managed by a head master and an assistant, or lower master. The teaching force is large. Here, as at most English public schools, the education is largely classical, though here, as elsewhere, natural science, mathematics, history, the modern languages, and the like made places for themselves in the last half of the nineteenth century. An army class provides special preparation for those who are intending to take the army examinations. The buildings, which are very beautiful, consist of two groups, of which the older, containing the chapel, hall, and library, the apartments of the provost, master, and fellows, incloses two quadrangles. The boys' library and sleeping apartments form the new buildings attached to the northern side of the older group. (Consult Gray, *Ode on a Distant Prospect of Eton College*.) For worthies of Eton, consult Creasy, *Eminent Etonians* (London, 1848), a series of brief biographies of its principal members, with a sketch of the college. For general history of the school, consult Sir H. Maxwell-Lyte, *History of Eton College* (London, 1904), and Cust, *History of Eton College, 1440-1898* (ib., 1899). See also MONTM CUSTOM.

ETOROFU, á-tó'ró-fóo, or **ITURUP**, é'tou-róop'. The largest of the Kurile Islands, belonging to Japan, situated between the islands of Kunashiri and Urupp and crossed by the meridian 148° E. Area, about 1500 square miles. It is of volcanic origin and contains an active volcano. Pop., about 1350.

ETOSA LAKE. See KUNENE.

ÉTOURDI, á'tóor'dé, L' (Fr., The Unmindful One). A five-act comedy by Molière, produced at Lyons in 1653.

ÉTRETAT, á'tre-tá'. A fashionable watering-place in the Department of Seine-Inférieure, France, on the English Channel, 18 miles north-east of Havre (Map: France, N., F 3). It is picturesquely situated at the foot of high cliffs, has a fine beach, casino, and bathing establishment, a Romanesque church, several hotels, and numerous attractive summer cottages. It is a favorite resort for literary men and artists. Pop. (commune), 1901, 1944; 1911, 1973.

ETRURIA. The people called by themselves the Rasena, by ancient writers Tyrrheni and Tusci, and in modern times Etruscans, are among the mysteries of history. Though scattered at one time over a larger part of Italy, the centre of their power was in the region bordered on the north by the valley of the Arno, on the east and south by the Apennines and the Tiber. This was Etruria proper. There were also two other regions colonized by the Etruscans—the valley of the Po in the north and the plains of Campania in the south. They formed the most advanced civilization in central Italy before the dominion of Rome.

Origin and History. Critics do not agree as to the origin of the Etruscans. One school makes them come by land across the Rætian Alps, with their earliest settlement in the north and inland. A second school believes them to have come by sea. Herodotus believed them to be Lydians. Some modern writers connect them with the Pelasgians or Hittites. They certainly appear to have come from Asia Minor. Their own legends place the beginning of their power in Italy in 1044 B.C. The discoveries in the necropolises of Etruria would place the rudest

of the early tombs at a period only slightly subsequent to this date. For several centuries the tribe remained stationary and retired, probably in the region of Monte Amiata and the Ciminian forest, though there may have been other centres as well. Between the eighth and sixth centuries B.C. the tribe embarked on a career of conquest among the earlier nations of central Italy. The earliest cities to be subdued were those along the seaboard, such as Tarquinii and Cære, and only quite late did inland cities like Perugia and Arretium fall into their hands. The Etruscans in many cases appear to have found among the conquered a more advanced civilization, but their superior organization and vigor made them conquerors. They formed probably the governing class, an aristocratic oligarchy. For a time there were three separate Etruscan confederacies, each composed of 12 cities or states. The southern confederacy (Etruria Campaniana) included Capua and Nola; the northern (Etruria Circumpadana) Felsina, Mantua, Ravenna, and Hadria. The central confederacy alone counts in history as important and included many more important cities than the necessary 12: Tarquinii, Cere, Veii, Vulci, Volsinii, Falerii, Nepete, Sutrium, Populonia, Rusellæ, Clusium, Vetulonia, Volaterræ, Perugia, Cortona, Arretium were the largest, and the 12 confederates are probably to be found among them, the list varying at different times. Each separate state was governed by magistrates annually elected, with the titles of Lucumo (Lauchme), Porsena (Purtevana), and Marunuch, chosen from the ranks of the hereditary priestly nobles. In times of war a single supreme chief was chosen—like Porsena of Clusium—and his bodyguard consisted of 12 lictors, one from each city, as symbols of his authority. This is another point of resemblance with the Hittites, whose confederacy was similarly organized. The laws, both religious and civil, were embodied from early times in a triple series of books (*libri discipline*), the first being the *libri haruspiciini*, treating of divination by sacrifice; the second, the *libri fulgurales*, on divination by lightning; the third, the *libri rituales*, of more general import, treating of the founding and consecrating of cities and buildings, of the organization of the people, of the army, and the state in times of peace and war. Etruria was noted as a hotbed of superstition and profligacy even after her downfall.

The Etruscans are closely connected with the earliest history of Rome. According to an ancient tradition they formed the third constituent tribe of Rome, the Luceres; but this is no longer accepted by most authorities. It seems more likely that the tradition of the Tarquin kings represents an Etruscan conquest of Latium and Campania at some time before 800 B.C. After the expulsion of the Tarquins the Etruscans sought to reestablish them by force under the leadership of the Porsena of Clusium (750 B.C.). At this time the Etruscan cities were great commercial centres; those situated at a little distance from the seaboard had their special ports: Cære had Pyrgi, Vetulonia had Telamon, Tarquinii had Gravisæ. Their onward march in companies was shown by their attack on the Greeks of Cumæ in 523 B.C. The keen rivalry for commercial mastery then pending between the waning Phœnicians and the Greeks led Carthage to seek an alliance with the Etruscans, whose fleet must have been powerful

and in control of local commerce. The terms of this treaty gave Corsica to the Etruscans and Sardinia to the Carthaginians. At this time the inland conquests of the Etruscans were substantially completed. Their first great defeat came in 474, when Hiero of Syracuse punished them for assisting the Athenians by practically annihilating their sea power. Between this time and the final destruction of their independence by Rome, at the battle of the Vadimonian Lake in 283 B.C., were two centuries of steady political decay, marked by their defeat by the Gauls, who overran Etruria Circumpadana; by the Umbrians, who attacked on the east; by the Samnites, who subjugated Etruria Campaniana, and by the Romans, whose progressive stages of conquest were marked by the capture of Veii in 396 B.C. after 10 years' siege, and by that of Falerii. But the practical nature of the Etruscans seems to have shown itself by the easy fashion in which they turned their downfall into a further opportunity for a life of ease and luxury without responsibility. But they felt the influence of the far higher civilization of Rome. Certainly up to the time of the Gracchi Rome could not compare in magnificence or wealth with any of the greater Etruscan cities.

Customs and Religion. Judging from the monuments, the Etruscans were a short and thickset people, with heavy features, much given to good living, games, and amusements. Dancing, music, and the theatre flourished; festivals were frequent and sumptuous. There was great love of pomp and ceremony and of rich costumes. The Roman use of the *toga picta* and *palmeta* and of the *corona Etrusca* in the triumph, the lictors, the system of slavery and clientship, the love of theatrical and amphitheatrical shows, the organization into tribes, the system of divination, and many other important customs and beliefs were derived by the Romans from Etruria. The Etruscan pantheon, as we know it, is a late piece of patchwork. The supreme trinity was Tina (Jupiter), Uni (Juno), and Menrfa (Minerva). Other principal deities were Sethlans (Vulcan), Turan (Venus), Phuphlans (Bacchus), and Turms (Mercury). Mantus was the ruler of Hades with his consort Mania, assisted by Charun and the Furæ. These *Dii consentes* had above them a series of nameless deities, inexorable as fate, probably the original Chthonian divinities before Greek influence began.

Language. The obscurity of Etruscan history is due largely to the absence of any literature and to the present inability to decipher the known inscriptions. The Etruscan language is still a mystery. The alphabet is clear. It contains 19 letters, derived from a Græco-Chalcidian prototype, which was first adopted along the southern seaboard. But critics have not yet even determined to what family the language belongs; the two principal theories are that it is Aryan or Semitic. Although about 6000 inscriptions have been found, they are nearly all (four-fifths) sepulchral and so short and largely composed of proper names that only about 200 other words have been detected. Only 15 inscriptions are bilingual, and these are of little use. The longest inscription, on the Perugia Cippus, contains 46 lines. A great deal is expected from the study of the recently discovered linen mummy cloths at Agram, containing over 200 lines of an Etruscan book. It was recognized in 1891 by Professor Krall, of Vienna. In such progress as has been made the stages have been

marked by Lepsius' study of the alphabet, by Corssen's first attempt at laying a scientific basis for linguistic study (*Die Sprache der Etrusker*, Leipzig, 1874), and by the subsequent studies of Pauli and Deecke, who hold opposite theories. A few facts are known. The Etruscan language expresses relationship both by separate words and by suffixes; it possesses gender and enclitics; it does not distinguish accusative from nominative case; but has genitive (-s) and dative (-si or -thi) as well as plural (-r or -l).

Archæology and Art.—Architecture.—It is through archæological excavation that nearly everything known about the Etruscans has been discovered. More is known of Etruscan engineering than of architecture. The cities were carefully laid out on a quadrangular plan, with well-fortified citadels and walls; the walls were strengthened by towers and double gates. The Etruscans themselves used tufa and other stones squared and laid in horizontal courses, but there is some dispute whether the polygonal and irregular cyclopean masonry of some cities in Etruria was built by them or another and earlier race, perhaps the Pelasgians (q.v.). The city of Marzabotto, in the Province of Bologna, is the best instance of an Etruscan colony, laid out in regular streets, with pavements, sidewalks, and drainage. The Servian wall in Rome is of Etruscan construction. On the other hand, Russelle, Cosa, Vetulonia, Veii, and other cities are built in the polygonal style. Almost nothing of Etruscan temple architecture remains. From Vitruvius, and the descriptions of the temple of Jupiter Capitolinus in Rome, from remains at Alatri, Satricum, Segni, Norba, and Falerii, it is evident that the Etruscans, Latins, Volscians, and other tribes adopted their temple from the early Greeks, taking as form the early temple *in antis* (not peristyle), with very deep portico. The usual material was a wooden core, covered with terra cotta, for columns, entablature, gables, etc., while the cella walls were of brick or stone. Hence their easy destruction by fire and disintegration. Nearly all the remains consist of the terra-cotta ornaments, such as antefixes (see ANTEFIX), sculptured friezes, and gable statuary. Marble sculpture, on account of its weight, could never be used in connection with these light wooden structures, but terra-cotta sculpture was carried to great perfection between the fifth and third centuries, as is shown by the remains at Satricum, Falerii, and Luni, which are unique in plastic history and in some cases purely Greek in style. The order employed was a modification of the Doric, called the Tuscan, the proportions of which, owing to the influence of the material, were much lighter; they can best be studied in Vitruvius and in early Roman examples copied from Etruscan buildings. In their tombs the Etruscans showed as much genius as the Greeks. Throughout Etruria there are large and early domical and vaulted tombs for great chiefs, which remind one of the tombs of the Homeric heroes and of the Lydian Alyattes. Such are those at Veii, Vetulonia, Vulii, Clusium, discovered full of antiquities, mostly imported from the East. These all date from the eighth, seventh, and sixth centuries. To another class, and certainly to the Etruscans themselves, belong the flat-roofed tombs imitated from the house, of which fine series exist at Cære and Perugia, dating between the sixth and third centuries B.C. These were often painted like the Egyptian tombs, with frescoes, from which we

gain our principal knowledge, not only of Egyptian funeral rites, but of their beliefs and daily life. No remains of royal palaces or of public buildings have come to light, so that there is but a meagre remnant of Etruscan architecture.

Sculpture.—It is different with sculpture. In character Etruscan sculpture lacks beauty of style, poetry, and imagination. It is essentially utilitarian and material. Stone, bronze, and terra cotta were used at a very early date. It is either in the tombs, as at Vetulonia, or above them that the early stone sculptures are found, in the form of statues or steles carved in relief to mark the site. During this early stage (seventh to sixth century), when Oriental influence dominated, there was a peculiar mixture of realism and archaic style, as shown in the great terra-cotta sarcophagi at the British Museum, the Louvre, and the Papa Giulio Museum in Rome, in which the husband and wife are represented in life-size figures reclining on the funeral couch in conversation, while scenes in low relief are carved on the faces of the sarcophagus. Later, marble came into use for sarcophagi. Sometimes it was painted, as in the wonderful sarcophagus at Florence of the Hellenic period (fourth century); but when the burial after incineration became the rule the small carved ash urns were produced in thousands. The largest collections are in the Vatican, at Perugia, Florence, Corneto, etc. Their scenes are very instructive as to Etruscan mythology, but they show a great and growing dependence on Greek thought. Bronze sculpture was an Etruscan specialty. Even the Greeks recognized this fact and imported the Etruscan works. This was the case not only with statues, like the Mars of Todi and the Orator of Florence, with busts like the Brutus in the Capitol, and with statuettes innumerable, but with articles of furniture and decoration, such as candelabra, jewel cases, the famous *cista*, and mirrors. The Ficoroni *cista*, with its exquisite engraved scenes, belongs to a class not found elsewhere in the artistic world. Many of the mirrors also are beautifully engraved with figured scenes.

Minor Arts.—The Etruscan tombs, beginning in the eighth century, are filled with a wealth of objects unparalleled except in Egypt, and excavations do not seem to exhaust their riches. Their contents, however, do not illustrate merely Etruscan, but ancient Oriental and Greek, art as well, especially in the cities of maritime and southern Etruria. This is the case especially with gold jewelry (q.v.) and vase painting. It is now quite certain that a large part of what has generally been called Etruscan jewelry came to Etruria from Greece, and the great majority of Attic and other Greek vases have been recovered in this way. The tombs of Orvieto (Falerii) are especially rich in Greek vases, many of them signed. It is easy to distinguish the native Etruscan ware; not so easy the jewelry. Of the jewelry, arms, and armor there were two classes—that for use and that made as a votive offering and for burial. The latter class was extremely fragile and light. The Etruscan women were famous for the amount and richness of their jewelry wreaths and coronets, pins, earrings, necklaces, fibulas, breast-plates, armlets, bracelets, and rings. The great use of jewelry, while commencing as early as the seventh century, seems not to have reached its climax until the fourth century. The Vatican has a great deal of the early jewelry. The

Metropolitan Museum in New York has a fair collection of the middle and later periods. But by far the greatest in number and variety of the objects found are the earthenware vases. There is one class essentially Etruscan, with its centre of manufacture at Chiusi (Clusium); it is the black ware with raised ornamentation called *bucchero nero*. There is the greatest and most fantastic variety in form and figured ornament in this class when compared to the sober and limited shapes of painted vases of the Greek class. The Etruscans had tried imitating Egyptian and Phœnician ware, but, with the importation of Corinthian painted vases in the seventh and sixth centuries and of Attic and other vases in the succeeding period, Greek mastery became supreme. The imitation is rarely perfect enough to deceive, but it is even closer than Phœnician imitations. One finds Etruscan echoes of all the Greek periods and schools of vase painting down to the third century, including imitation of the schools of southern Italy. In all their work the Etruscans seem to have followed simply commercial instincts and love of luxury. They had no artistic feeling. Whatever realism occasionally gives interest to their sculpture is due to the same regard for beliefs concerning the future life as are found in Egypt. The Etruscans held the pre-Hellenic attitude towards art as explanatory, decorative, and useful, not serving a higher purpose, or for its own sake as beautiful. Therefore they missed, in their imitations, the true spirit of Greek art. It is certain that Greek artists occasionally worked for and with them. Demaratus, the father of Tarquin, is said to have been a Greek artist from Corinth. Some of the paintings at Caere and Corneto must be by a Greek hand; also some of the terra-cotta temple sculptures. The artistic influence of Etruria upon Rome was paramount from the time of the Tarquins to the rise of Greek influence in the third century B.C. Even after that time it still lingers in the sarcophagus reliefs and statuary.

In two other branches the Etruscans produced imitative works of no higher order—scarabs, gems, and coins. The imitation of Egyptian and Phœnician cut gems began at an early date, but the material (paste, bone, etc.) was cheap and the workmanship poor. During the fifth century, however, archaic Greek gems were fairly well imitated, but after this period little was done. Coinage also, as in all central Italy, was late in reaching the artistic stage. The Greek silver standard (Attic standard of Solon) was adopted late in the sixth century, but the workmanship on the Etruscan coins remained inferior. See EARRING; ROMAN ART.

Bibliography. Dennis, *Cities and Cemeteries of Etruria* (2 vols., London, 1878), gives the best description of the sites and ruins of Etruscan cities and cemeteries. A popular treatment of the same subject is by Seymour, *Up Hill and down Dale in Ancient Etruria* (New York, 1910). For an historical treatment, based on literary authorities alone, consult K. O. Müller, *Die Etrusker* (Stuttgart, 1877), and for a discussion of the subject from an archaeological standpoint, Helbig, *Della provenienza degli Etruschi* (Rome, 1883). The inscriptions are best consulted in Pauli, *Corpus Inscriptionum Etruscarum* (Leipzig, 1893-1902); supplemented by Latte, *Correntoni al Corpus Inscriptionum Etruscarum* (Florence, 1904). Other good treatises are Pauli, *Die Urvölker der Apenninen*

Halbinsel, in Helmolt, *Weltgeschichte*, vol. iv (Leipzig, 1910); Skutsch, "Etruskisch," in Pauly-Wissowa, *Real-Encyclopädie* (Leipzig, 1908). Interesting philological studies are those of Corssen, Deecke, and Pauli. The history of art is treated in Martha, *L'Art étrusque* (Paris, 1889); Seeman, *Die Kunst der Etrusker* (Dresden, 1890); Von Stryk, *Studien über die etruskischen Kammergräber* (Dorpat, 1910). Collections of the sarcophagus reliefs are to be found in Robert, *Die antiken Sarkophagen-Reliefs*, published by the Deutsches Archäologisches Institut (Berlin, 1890-1904); and of the mirrors in Gerhard, *Etruskische Spiegel* (5 vols., Berlin, 1843-67).

ETRURIA, KINGDOM OF. A kingdom established in Italy by Napoleon I in 1801, formed out of the Province of Tuscany and assigned by him to the Bourbons of Parma. In 1808 it became a part of the French Empire, and in 1809 Napoleon's sister, Elise Bacciocchi, was made Grand Duchess of Tuscany. On the overthrow of Napoleon in 1814, Tuscany reverted to Ferdinand III, brother of Francis I of Austria.

ETRUSCAN. See ETRURIA.

ETSCH, êsch. See ADIGE.

ETTINGSHAUSEN, êt'tings-hou'zen, KONSTANTIN, BARON VON (1826-97). An Austrian geologist and botanist. He was born and educated at Vienna and in 1854 was appointed professor of botany and of medical natural history at the Josephsakademie in Vienna, whence in 1871 he was called to Gratz. From 1878 to 1880 he was engaged by the British Museum in researches concerning its collection of fossil plants. To the study of nervation he devoted many of his principal works. Among them are: *Physiotypia Plantarum Austriacarum*, in collaboration with A. Pokorný (2 vols. of text and 10 vols. of copperplate illustrations, 1856-73); *Physiographis der Medicinalpflanzen* (with 294 imprints from nature, 1862); *Beiträge zur Erforschung der Phylogenie der Pflanzenarten* (7 books, 1877-80).

ETTLINGEN, êt'ling-en. A town of the Grand Duchy of Baden, Germany, on the Alb, about 4 miles south of Karlsruhe (Map: Germany, C 4). Its ancient wall and moat is still extant, but its only building of interest is the castle, built about 1730, on the site of an ancient Roman fortress. Educational institutions include a gymnasium and a Catholic teachers' seminary. It has manufactures of machinery, paper, cotton, shirtings, velvet, vinegar, and parchment. Pop., 1900, 8040; 1910, 9407. Ettlingen derives its origin from a Roman settlement. In 1227 it received municipal privileges and came into possession of the margraves of Baden. On July 9 and 10, 1796, it was the scene of the victory of the French under Moreau over Archduke Charles of Austria. The vicinity of Ettlingen is rich in Roman remains.

ETTMÜLLER, êt'mül'lër, ERNST MORITZ LUDWIG (1802-77). A German philologist. He was born at Gersdorf, Saxony, studied at Leipzig from 1823 to 1826, and in 1830 began to lecture at Jena on the German poets of the Middle Ages. In 1833 he was called to the gymnasium at Zurich, and in 1863 to the university there, as professor of German literature. He edited the literary remains of the Middle High German and Old Low German dialects. In 1850 appeared, under his editorship, an Anglo-Saxon chrestomathy, *Engla and Seaxna Scôpas*

and *Bôceras*, and in the following year his *Levi-con Anglo-Saxonium*. He also gave his attention to the old Norse literature, as is shown by an edition of the *Fauluspá* (1830), translations, and a Norse reading book, and wrote several original poems. His *Handbuch der deutschen Literaturgeschichte* (1847) includes treatments of the Anglo-Saxon, the old Scandinavian, and the Low German. Among his other works worthy of mention are: *Altnordischer Sagenschatz in neun Büchern übersetzt und erläutert* (1870); *Herbstabende und Winternächte, Gessprache über deutsche Dichtungen und Dichter* (3 vols., 1865-67); and his translation of *Beowulf* (1840).

ETTOR, JOSEPH J. (1886-). An American leader of the Industrial Workers of the World. He was a leader in labor disputes at Paterson, N. J., Brooklyn, N. Y., McKee's Rocks, Pa., and elsewhere; but he first attracted general attention by his capable leadership in the Lawrence (Mass.) textile mill strike in 1912, and by his subsequent nine months' imprisonment with Arturo M. Giovannitti (q.v.), when they were charged with responsibility for the death of a woman who was shot in a riot on Jan. 29, 1912. He was one of the leaders of the waiters' strike in 1913 and of the barbers' strike in 1914, both in New York City. He became a member of the executive council of the Industrial Workers of the World.

ETTRICK. A valley in the south of Selkirkshire, Scotland, watered by the Ettrick River, which rises near Ettrick Pen, 2223 feet high (Map: Scotland, E 4). The river runs in a northeasterly direction for 32 miles and empties into the Tweed. Its chief affluent is the Yarrow, which runs 25 miles from the west through a beautiful and poetically celebrated vale. Ettrick Forest, a royal hunting tract, swarming with deer till the time of James V, included Selkirkshire and some tracts to the north. In Ettrick Vale, at Tushielaw, dwelt the celebrated freebooter or king of the border, Adam Scott, who was summarily executed by James V in 1530. James Hogg, the Scottish poet, known as "the Ettrick Shepherd," was a shepherd in this part of the country. Consult Craig-Brown, *History of Selkirkshire* (Edinburgh, 1886).

ETTRICK SHEPHERD, THE. See HOGG, JAMES.

"ET TU BRUTE!" (Lat., And thou also, Brutus!). The words commonly believed to have been uttered by Julius Cæsar when struck by the hand of Brutus. There is, however, no ancient Latin authority for attributing them to Cæsar. The strong popular belief in their authenticity is a remarkable tribute to the genius of Shakespeare, who puts them into Cæsar's mouth at the moment of his fall (*Julius Cæsar*, III, i, 77). The words occur in other Elizabethan writers.

ETTWEIN, ét'vin (1721-1802). A Moravian bishop. He was born of Waldensian ancestry at Freudenstadt, Württemberg, June 29, 1721, joined the Moravians in 1739, was ordained in 1746, came to America as a traveling evangelist and missionary to the Indians in 1754, and preached in 11 of the Colonies, traveling to the present State of Ohio, and to 12 Indian tribes. During 1776 and 1777 he was chaplain in the general hospital of the American forces at Bethlehem, Pa. Later he negotiated with Congress in behalf of the Christian Indians and represented the Moravians in dealings with the government. In 1784 he was consecrated a

bishop, with charge of the Moravian churches in America; in 1787 he founded the Society of the United Brethren for Propagating the Gospel among the Heathen, which is still active. He prepared a dictionary and phrase book of the language of the Delaware Indians and published an account of their customs, traditions, etc. He died at Bethlehem, Pa., Jan. 2, 1802.

ETTY, WILLIAM (1787-1849). An English figure and historical painter. He was born at York, March 10, 1787. In accordance with the wishes of his father he served seven years of apprenticeship to a printer of Hull. He was, however, enabled to prosecute his studies in painting through the generosity of his uncle, William Etty, who in 1806 invited him to London. In 1807 he entered the Royal Academy School, studying under Fuseli, and he also studied privately for a year under Sir Thomas Lawrence, whose influence for some time dominated his art. He copied a great deal from the old masters in the National Gallery and was a constant student in the Life School of the Academy, even after he had become an Academician. He paid a brief visit to Paris and Florence in 1816, and in 1822 he took a longer journey to Italy, spending most of his time in Venice. From his studies of the Venetian masters he acquired that excellence in color for which his works are chiefly known. On his return to England, in 1824, his "Pandora Crowned by the Seasons" was much applauded, and he was made a member of the Royal Academy in 1828. From this time he was very successful and amassed a good competence. He resided in London until 1848, but on account of failing health he retired to York, where he died Nov. 13, 1849.

Etty painted very unequally. His work at its best possesses great charm of color, especially in the glowing, but thoroughly realistic, flesh tints. The composition is good, but his drawing is sometimes faulty, and his work usually lacks life and originality. He often endeavored to inculcate moral lessons by his pictures. He himself considered his best works to be "The Combat," the three "Judith" pictures, "Beniah, David's Chief Captain" (all in the National Gallery of Scotland, Edinburgh), "Ulysses and the Sirens" (Manchester Gallery), and the three pictures of "Joan of Arc." He is also represented in the South Kensington Museum, at Glasgow and in English provincial museums, and in the Metropolitan Museum, New York, by "The Three Graces," considered by many his masterpiece.

Consult: his "Autobiography," in *Art Journal* (London, 1849); Gilchrist, *Life of W. Etty* (ib., 1855); Cosmo Monkhouse, "Etty," *Dictionary of National Biography* (ib., 1880).

ÉTUDE, ét'ud' (Fr., a study). Originally a composition for some instrument written for the purpose of developing technical skill. The name was first used by J. B. Cramer in his op. 50, the famous 84 studies for pianoforte, published in 1810. Each study is built upon a single theme and designed to develop some particular point, such as staccato, arpeggio, trill, etc. Soon various composers recognized the possibilities of this simple form and began to write studies for concert performance. These contained not only an accumulation of technical difficulties, but frequently themes of rare beauty and power. Such are the famous études of Liszt (*Études*

d'exécution transcendante), Schumann's *Études symphoniques*, and Chopin's *Études*, op. 10 and 25, all of which are in the concert repertoires of the greatest pianists and rank among the greatest compositions for pianoforte. Of similar works for the violin may be mentioned the études of Kreutzer, Fiorillo, and Paganini. Some of the more extended études introduce also a second theme. See CHOPIN.

ETYMOLOGICUM GUDIANUM. See ETYMOLOGICUM MAGNUM.

ETYMOLOGICUM MAGNUM (Lat., great etymological work). The name commonly given to a Greek lexicon which dates from the early part of the tenth century A.D. The compiler is unknown, but the work was based on a similar work of the ninth century, which should properly bear the title, and another lexicon similar to the extant *Etymologicum Gudianum*. The ninth-century etymologicum no longer exists uncontaminated by later additions, but it is clear that it preserved in purest form the basis of the numerous Byzantine etymologica which have been transmitted to us. These all profess to give the etymologies of the words contained in them—hence the name. In spite of the fanciful derivations they often contain much valuable material, particularly from earlier writers. On the whole subject, consult Reitzenstein, *Geschichte der griechischen Etymologika* (Leipzig, 1897), and Cohn, "Griechische Lexicographie," pp. 702, 703, of Brugmann-Thumb, *Griechische Grammatik* (4th ed., Munich, 1913). The best edition of the *Etymologicum Magnum* is by Guisford (Oxford, 1848). The *Etymologicum Gudianum* and others are edited by Sturz (Leipzig, 1816-20). See DICTIONARY.

ETYMOLOGY (Lat. *etymologia*, from Gk. *ἐτυμολογία*, from *ἐτυμος*, *etymos*, true + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). That branch of philology (q.v.) which deals with the derivation of words and with their comparison in different members of the same language group. In its relation to the other great subdivisions of linguistic science, phonology, morphology, and syntax, etymology stands in closest association with phonology. Without rigid scientific adherence to phonetic law (q.v.) there can be no real etymology. On the other hand, phonology in its nonphysiological aspect is based on etymology. The earliest of all the branches of linguistics to attract attention was etymology. The word was first used as a philosophical, not as a linguistic term. The Greek Stoics, in their disputations with the Skeptics, asserted that language existed by nature, not by convention. Words were therefore real (Gk. *ἔτυμος*), and it was the task of etymology, according to the Stoic view, to prove this reality. It is, however, noteworthy that long before the foundation of the Stoic school, Plato (q.v.) made an approximation to the modern method in his *Cratylus*. Not only does he there set forth for the first time the elemental divisions of Greek phonology, but he intentionally etymologizes. Thus he correctly connects *γυνή*, woman, with *γενή*, seed, and going a step further declares that the words for fire (*πῦρ*), water (*ὕδωρ*), and dog (*κύων*) are almost the same in Greek as in Phrygian, which we now know to be related to the Armenian (cf. Armenian *hur*, fire, *get*, water, *šun*, dog). Independently of Greece, India developed a study of language far more exact and thorough than any other ancient people ever did. As in Greece etymology had sprung from philosophy, in India

it had its basis in religion. The first formal treatise on etymology in Sanskrit is Yaska's *Nirukta* (literally, outspoken), which dates perhaps from as far back as the fifth century B.C. The *Nirukta*, which ranks as one of the six Vedangas, or members of the Veda, was composed to explain hard words in the *Rigveda*. The stress laid upon the source and meaning of the words, both in India and in Greece, is highly significant of the practical value of etymology. It is safe to affirm that without etymology there can be no exact orthoëpy. Exactness in the use of words is in direct proportion to the exactness of knowledge of their meaning, and exactness of knowledge of their meaning is in its turn in large measure conditioned by exactness of knowledge of their origin. Again, the attempt to etymologize is found in the earliest literary records. The Indian Yajur Veda (q.v.) abounds in these primitive etymologies, many of which are extremely naive and erroneous (as the story that the deity Prajapati swelled up, *asvayat*, and from this swelling *asvayatha*, came the horse, *asva*), while others are still deemed correct (as when by day, *divā*, Prajapati created the gods, *dēvās*, "for that is their godhead," *dēvatvam*). In the Bible *Eve* (Hebrew *חַוְוָה*, Gen. iii. 20) is popularly derived from *hāwā*, to be, and in Gen. ii. 23, *ishsha*, woman, is explained as a derivative of *ish*, man. This primitive kind of etymology is still common and is known as popular, or better as folk, etymology. It is sometimes right and more frequently wrong. Often among those who are unacquainted with the history of words, there will be found attempts to etymologize them as being related to others to which they may have some phonetic or, less commonly, some graphic resemblance. Examples of this are exceedingly numerous. Thus, German *Wahnwitz*, frenzy, is popularly associated with *wahnen*, to think, especially to think incorrectly, whereas it really signifies, as the Old High German form *wana-wizzi* shows, witlessness, the first component being *wana*, without. Another instance is German *Sundflut*, deluge, connected popularly with *sunden*, to sin, but really derived from *stuvluot*, great flood. In English we have words like *bridegroom* (shortened also into *groom*), really bride's man (Anglo-Saxon *brydguma*), associated with *groom*; *island*, properly isle-land (Anglo-Saxon *eg-lond*), which has been explained as land like an eye in the waters; *crayfish* (French *écrevisse*, crab), which is supposed to be a sort of fish, or *asparagus* (Greek *ἀσπάργος*), which becomes *sparrow grass* in rustic speech. Abortive as many of the popular etymologies are, they are none the less important as indicating the universal need, felt by such as employ language, for some sort of explanation of the meaning of the words they use.

With the discovery of the importance of Sanskrit (q.v.) in linguistic investigation, and the rise of the science of comparative linguistics (see PHILOLOGY), etymology was placed on a scientific foundation. Its history is connected inseparably with the branch of learning of which it forms a part, but its method may be briefly outlined. First and foremost there must be a strict adherence in all etymological investigation to the principles of phonetic law (q.v.). The etymology which fails to conform to these laws must receive overwhelming confirmation from other quarters before it can be regarded as even possible. In the case of loan words phonetic law is apparently violated, and it will frequently

happen that a language will have two or more words derived from a single word, one being the regular phonetic development and the other a borrowed form. In this case the latter form, known by the French term *mot savant*, is usually differentiated in meaning from the former. Thus, we have in French and English such words as *royal* and *regal*, both from the Latin *regalis*, kingly; the form *regal* being borrowed directly from the Latin, while *royal* (cf. French *roi*, king, from the Latin accusative *regem*) is the phonetically correct form. Loan words may also undergo the regular sound changes of the language into which they have been adopted. Thus, Latin *pondus*, pound, appears in Gothic and Anglo-Saxon as *pund*, with unchanged consonants, but in Old High German it is subject to the action of Grimm's law (q.v.) and becomes *phunt*. It is therefore evident that in etymology attention must be paid to the history of words and sometimes to the records of the tribes speaking them. Thus, the English *wise* is akin to the Gothic *unveis*, unwise, Old High German *wis*, New High German *weise*; but *wise* is also a doublet of *guise*, which is the form assumed by *wis* in the Romance languages, which borrowed the word from the Germanic form. If it is true that the same word may assume different forms in the same language, it is equally true that different words may become identical in form in a given language. The large class of homonyms in every language is sufficient proof of this. An excellent English example of this phenomenon is *sound*, which is a conglomerate of four originally distinct words—viz., Anglo-Saxon *gesund*, hearty, Anglo-Saxon *sund*, a body of water, Latin *sonus*, noise, and Latin *subundare*, to dive beneath the waves. It is probable that many instances in which a word shows extraordinary diversity of meanings are to be traced to this process of conglomeration rather than to semasiological developments. (See SEMASIOLOGY.) It is, however, in the tracing of words back through an entire group of cognate languages to a hypothetical original form, denoted conventionally by an asterisk (*), that etymology finds its principal application. The older etymologists made wild guesses in their primitive investigations, and such etymologies are still made by untrained minds. Thus, Latin *deus*, god, Old Latin *deivos*, akin to Sanskrit *dēva*, god, has been connected with the English *devil*, from Greek *diábolos*, slanderer, and English *god*, in addition to the old stock comparison with *good*, with which the word has no etymological relation, has been equated with Sanskrit *gūḍha*, hidden. It is true that many etymologies which are perfectly sound seem at first sight impossible to those who are not acquainted with phonetic laws and the principles of word formation. It is also true that many etymologies which are very plausible to students of comparative linguistics are in reality doubtful and accepted only provisionally. Such etymologies may ultimately be discarded, just as the provisional assumptions often accepted by investigators in the exact sciences are discarded, if further research shows them to be false.

Etymology may be confined to a specific group of languages or dialects. We may thus speak of Romance etymology, where words in the Romance languages are traced back for the most part to folk-Latin originals (as French *même*, self, Old French *meisme*, Provençal *medesme*, Spanish *mismo*, Italian *medesimo*, from folk

Latin *met* + **ipsimus*), Germanic, Celtic, Indo-Iranian etymology, and the like. All these are combined in Indo-Germanic etymology. Similarly we may have Semitic, Dravidian, Uralo-Altaic, or Polynesian etymologies, but Indo-Germanic is the most thoroughly systematized of all and serves as a model for the rest. It must be borne in mind, however, that accidental resemblance of sound is no proof of etymological kinship. It is, consequently, unscientific to compare, as some have done, Semitic or Dravidian with Indo-Germanic words. The fact, e.g., that Latin *taurus* sounds like Arabic *thaur*, both meaning bull, or English *sheriff* (Anglo-Saxon *scir-gerefa*, shire-reeve) resembles in sound the Arabic *sharif*, exalted, also used of an official of a city, implies no relationship. Within a language group the same statement holds true. Sanskrit *sūpa*, broth, has no connection with English *soup*, nor are the English verbs *drag* and *draw* akin. As an example of etymological procedure, we may take the word for ten in the Indo-Germanic languages. Thus, we have English *ten*, Anglo-Saxon *tyn*, Old Saxon *tehan*, Icelandic *tiu*, Gothic *taíhun*, Old High German *zehan*, New High German *zehn*, Old Irish *deich*, Irish *deag*, Gaelic *deug*, Cornish and Welsh *dec*, Breton *dec*, Latin *decem* (whence the Romance group, Italian *dieci*, Spanish *diez*, Old French *dis*, French *dix*, etc.), Umbrian *desen-duf* for **decem-duf*, twelve (ten-two), Greek *deka*, Old Church Slavonic *deseti*, Czech *desátý*, Polish *dziesiąty*, Russian *desyati*, Lithuanian *dėsimtis*, Lettish *desmit*, Old Prussian *desimtis*, Armenian *tasn*, Albanian *djete*, Avesta, *dasa*, New Persian *dah*, Afghan *las*, Shighni *dis*, *lis*, Sanskrit *daśam*, Prakrit, Pali, *dasa*, Hindi *das*, Marathi *dahā*. A comparison of all these forms, and more which might be added to the list, results in the postulation of a pre-Indo-Germanic form **dek̑m*, to which, in accordance with the sound laws governing the various divisions of the Indo-Germanic languages, and with reference to the principles of word formation (as in the *-ti* formation in Old Church Slavonic, Czech, Polish, Russian, Lithuanian, Lettish, and Old Prussian in the example quoted), the various forms of the numeral ten are referred as to a convenient formula. (See PHILOLOGY.) The scope of etymology has been immensely widened by the theories of root determinatives and root extensions, and by the doctrine of the dissyllabic base or root (see PHILOLOGY), which have rendered possible the explanation of many words whose derivation had before been unknown.

ETYMOLOGY, FIGURES OF. Terms employed in etymological discussions. They must be carefully distinguished from the figures of rhetoric or speech, of prosody, and of syntax, although there are instances in which the different classes overlap. The most important figures of etymology are as follows: Ablaut or vowel gradation is the term given to such quantitative, qualitative, or accentual differences of the sonantal element of a root- or suffix-syllable, as were not called forth by sound-laws which were in operation at the time of the individual development of the Indo-Germanic languages, but had their origin either directly or indirectly in primitive Indo-Germanic differences. Every such syllable, whether a root or a suffix, may successively exhibit three main grades of vocalism which are denoted by the terms (1) "normal," (2) "weak" or "reduced," and (3) "deflected grade." Thus if the primitive syllable contains an *ē*, it is kept intact in the first grade; in the second, the *ē* vanishes entirely; and in the third, it is replaced by an *ō*. Thus from the Indo-Germanic root *pēt*, 'to fall or fly,' we have the Greek *πέρ-εθαι*, 'to fly' in the present; if reduced, we have *πέρ-εθαι* in the aorist of the same verb; lastly, if deflected, we have, *πέρ-δομαι*, 'I flutter.' So also Gk. *φέρω*, (*δλ-φ*) *φ-ος* and *φ-ο-ος*; Gothic *auhs-in*, *auhs-n-ē*, and *auhs-an-s*, where the ablaut appears in the suffix. Apheresis (Gk. *ἀφαίρεσις*, a taking away) is the loss of the initial letter or syllable of a word, as Sanskrit *stha*, 'ye are,' but Greek *ἐστί*, Latin *estis*; Sanskrit *kuḍḍāla*, hoe, but Singalese *udalu*; English *low* for *allow*. Apocope (Gk. *ἀποκοπή*, a cutting off) is the same process at end of a word, as Greek *παρά*, 'beside,' beside *παρά* (cf. Sanskrit *par*); Latin *fac*, 'do,' beside *face*; French *bel*, 'beautiful,' but Latin *bellum*; Old High German *hirti*, 'shepherd,' but German *Hirt*; Avesta *raoryna*, 'oil,' but Kashani Persian *rō*, beside *ruyan*. This phenomenon is due in almost every case to the weakening and ultimate disappearance of the final vowel or syllable on account of the stress-accent in the preceding part of the word. Assimilation (Lat. *assimilatio*, similarity) is the change undergone by sounds to make them harmonize with other sounds in the same word, and it may be either regressive, assimilating the second sound to the first, as Greek *κλυτύτερος*, 'sweetest,' beside *γλυκύτερος*, Latin *quinque*, 'five,' but Greek *πέντε*; or progressive, assimilating the first sound to the second, as Greek *Θέτις*, name of a sea-goddess, beside *Θέρις*; Old Church Slavic *mraviya*, 'ant,' but Greek *μύρμηξ*. By compensatory lengthening is meant the lengthening of a vowel of a syllable due to the loss of a following consonant, as Greek *pāsa* for *pānsa*; *ἔχουσι* for *ἔχουσι*; Latin *equūs* for earlier **equāns*; *totiēs* for *totiens*; French *pâte* for Latin *pasta*. Contamination (Lat. *contaminatio*, defilement) is a composite but not compound word, influenced by different words, as German *heischen*, 'to demand,' which is a contamination of Old High German *eisōm*, 'to demand,' and *heizzan* (German *heissen*), 'to call.' It is sometimes difficult to draw the line

between contamination and the far more frequent phenomenon of analogy (q.v.). Contraction (Lat. *contractio*, a drawing together) is the coalescence of two or more vowels into one, as Greek *τιμῶμεν*, 'we honor,' for **τιμάομεν*; *πρωῶμι*, 'I should honor,' for **τιμάομι*; Latin *copia*, 'abundance,' for **co-opia*. Crasis (Gk. *κράσις*, mixture) is the combination of two vowels into one, this change being in most cases only an artificial subdivision of vowel contraction, as Greek *φροῦδος*, 'vanished,' for *τρὸ ὁδοῦ*; Latin *cunctus*, 'all,' for **coiunctus*. Dissimilation (from Lat. *dissimilis*, unlike) is the reverse of assimilation, treated above, and is therefore the change undergone by sounds to make them different from other sounds in the same word, either regressively, as Greek *θηλητήρ*, 'hunter,' beside *θηρητήρ*; Italian *veleno*, 'poison,' beside *veneno*; or progressively, as Latin *fraglo*, 'I burn,' beside *fragro*; Old High German *turtultūba*, English *turtle-dove*, but Latin *turtur*; dialectic Italian *lumero*, 'I count,' beside *numero*. Dissimilation often involves loss of sounds, as Latin *mamor*, 'marble,' beside *mar-mor*; Spanish *cribo*, 'sieve,' but Latin *cribrum*; Sanskrit *tisṭhati*, 'he stands,' but Avesta *hištaiti*, Latin *sistit*; Latin *spondeo*, 'I pledge,' but perfect *sporondi*. This tendency forms the basis of Grassmann's law (q.v.). Epenthesis (Gk. *ἐπένθεσις*, insertion), or, more scientifically, anaptyxis (Gk. *ἀνάπτυξις*, unfolding), is the insertion of a letter or syllable, as Latin *drachuma*, from Greek *δράχμη*, 'drachma,' *μεσημβρία*, *midday*, for **μεσημ(ε)ρία*; English *umbrella* for *umbrela*. Gemination (Lat. *geminatio*, a doubling) is a doubling of consonants, as Greek *ισχυρός*, 'strong,' beside *ισχυρός*; Latin *cuppa*, 'tub,' beside *cupa*; German *Himmel*, 'heaven,' beside Middle High German *himel*. It is normally accompanied by the shortening of a preceding long vowel. Haplogy (from Gk. *ἁπλός*, simple, and *λόγος*, word) or haplology (from Gk. *ἁπλός*, simple, and *λαλία*, speech) is the suppression of one of two homophonous syllables in a word, as Greek *ἀμφορεύς*, 'pitcher,' for **ἀμφιφορεύς*; Latin *semodius*, 'half-peck,' for **semimodius*; English *dynamometer*, beside *dynamometer*. Hiatus (Lat., gap) is the juxtaposition of two or more vowels without contraction, as Greek *πρόαγω*, 'I lead forth'; Latin *ea*, 'she,' Gothic *aldaike*, 'I increased,' from *aukan*. Metathesis (Gk. *μετάθεσις*, transposition) is the transposition of letters in a word, one of the most frequent of all the figures of etymology, as Greek *κάπτος*, 'strength,' beside *κράτος*; *χιτών*, 'tunic,' beside *κυθών*; Latin *sterno*, 'I strew,' beside the perfect *stravi*; *religio*, 'religion,' beside *religio*; *cloaca*, 'sewer,' beside *cloaca*; Italian *capra*, 'goat,' beside *capra*; *gloria*, 'glory,' beside *gloria*. As will be seen from the examples quoted, metathesis affects especially the liquids *r* and *l*, but we also have such changes as Sanskrit *sakaṭa*, 'stupid,' Pali *kaṣaṭa*; Sanskrit *sayana*, 'bed,' Singhaliese *yahana*. Paragoge (Gk. *παραγωγή*, addition) is the addition of one or more inorganic letters to the end of a word. In Greek the so-called 'nu movable' (Greek *νῦ ἐφέκυστικόν*), which is added especially to words ending in *-σι*, and to verbs with the third person in *-ε* before vowels (as *πᾶσι δίδωσι ταῦτα*, 'he gives these to all,' but *πᾶσιν ἔδωκεν ἐκεῖνα*, 'he gave those to all'), perhaps may be placed here superficially. An English example is the paragoge *r* in such words as *law-r*. This phenomenon is usually caused by the desire to avoid a hiatus, but is often etymologically justified, as in the case of the French *a-t-il*, 'has he?' beside *il a*,

'he has' (folk Latin *habet-ille*, beside *ille habet*). Prothesis (Gk. *πρόθεσις*, a placing before) is the prefixing of an inorganic sound to a word, as Greek *ἐρυθρός*, 'red,' but Latin *ruber*; Armenian *erek*, 'evening,' but Sanskrit *rajas*; Sanskrit *ulōka*, 'world,' beside *lōka*; Avesta *ašma*, 'wrath,' but Persian *ašm*; Latin *status*, state, but Spanish *estado*, Old French *estat*, French *état*; Cockney English *Hi* for *I*. Simplification (from Lat. *simplex*, simple, and *facere*, to make) is the reverse of gemination, treated above, and consists in the substitution of a single consonant for a repeated or double one, as Greek *μέσος*, 'middle,' beside *μέσσος*; Latin *vacilo*, 'I waver,' beside *vacillo*; Old High German *doufene*, 'to dip,' beside *doufenne*. Syncope (Gk. *συγκοπή*, abbreviation) is the omission of a letter or syllable from the interior of a word, as Greek *πατήρ*, 'of a father,' beside *πατέρος*; Latin *præbeo*, 'I offer,' for **præhibeo*, **præhabeo*; Provençal *anma*, 'soul,' from Latin *anima*; Sanskrit *la śuna*, 'onion,' but Singhaliese *lūnu*; Anglo-Saxon *nołde*, 'would not,' for **ne wolde* (cf. English *nilly-willy*); English *wondrous* beside *wonderous*. Syncretism is the tendency towards a reduction of the number of case or tense forms. Thus the Indo-Germanic Locative, Instrumental, and Ablative cases have become united into the Ablative Case in Latin; the relations expressed by the same cases in Indo-Germanic, including the Dative, have become confused into the Dative in the early Germanic. Tmesis (Gk. *τμήσις*, division) is the separation of the parts of a word, especially a compound, by another word. This is properly only an apparent figure. It had its origin in verbs compounded with prepositions, and as prepositions are originally stereotyped case-forms of nouns used adverbially (see PREPOSITIONS), the union was at first only a very loose one, as in English *overbear* beside *bear over*. As examples may be cited Greek *ἐπὶ κνέφας ἦλθεν*, 'darkness came on,' for *κνέφας ἐπῆλθεν*; Latin *sub vos placo*, 'I implore you,' for *supplicio vos*; and such a monstrosity as *cere-communui-ūrum*, 'he dashed out his brains,' for *cerebrum comminuit*. In German this tmesis is subject to regular laws, as *er führte seinen Entschluss aus*, 'he carried out his resolution,' but *ich sagte, dass er seinen Entschluss ausführte*, 'I said that he carried out his resolution.' Finally, Umlaut or Metaphony, taking place principally in English and German, indicates the mutations undergone by a vowel, *a*, *e*, *o*, *u*, when immediately followed by a syllable which contains an *i*, or the semi-vowel *j*, under the influence of which it acquired a slight *i*-sound, and altered accordingly. Thus German *mann* but *männlich*; *erde*, *irdisch*; *buch*, *bücher*; English *man*, *men*; *brother*, *brethren*; *goose*, *geese*; *foot*, *feet*. As the antiquity of the terms implies, the majority of the figures of etymology were known to the classical grammarians, although the full explanation of them has been rendered possible only by the development of comparative linguistics (see PHONOLOGY), especially of that branch of it which deals with etymology (q.v.).

ETZEL, *ét'sel*. See ARTILA.

EU, *ē* (ML. *Auga*, *Augium*). A town in the Department of Seine-Inférieure, France, near the mouth of the Bresle, 93 miles north-northwest of Paris (Map: France, N., G 2). It is remarkable for the fine twelfth-century Gothic church of Saint-Laurent and for the Château d'Eu, a low seventeenth-century building of red brick, with high, tent-shaped roofs of slate, Louis Philippe

expended large sums on the embellishment of the château, its magnificent park and unique portrait gallery. A large part of the château was destroyed by fire in 1902. The harbor of Eu connects through its own canal with the sea harbor of Le Tréport. Eu manufactures furniture, leather, sail cloth, ropes, soap, lace, and silk. Pop. (commune), 1901, 5398; 1911, 5651.

EU, PRINCE LOUIS PHILIPPE MARIE FERDINAND GASTON D'ORLÉANS, COMTE D' (1842-1922). A Brazilian soldier. He was born in France, the eldest son of the Duc de Nemours and the grandson of Louis Philippe. In 1864 he was married to Isabel, heiress apparent to the throne of Brazil. He was a marshal in the Brazilian army and was commander in chief of the allied forces in the war with Paraguay, which he brought to a successful termination in 1870. During Emperor Dom Pedro's long visits to Europe the Comte d'Eu had the direction of Brazilian affairs, but he became very unpopular, owing to his ultraclerical views, and, after the proclamation of the Republic in 1889, retired to France.

EUÀ, á-ŏ'á, or EOA. One of the Tonga (q.v.) or Friendly Islands, about 10 miles southeast of Tongatabu, in lat. 21° 25' S., and long. 174° 50' W. It is about 10½ miles long by 3 miles wide. Its surface is rugged; the highest elevation reaches an altitude of 1078 feet. Area, 67 square miles. Pop., 350.

EUANTHIUS. A Roman grammarian, who died at Constantinople in 358 A.D. He wrote a commentary on Terence which Donatus used in his own commentary on Terence. Euanthius' treatise *De Fabula* appears, apparently in full, in Donatus' work. Consult Wessner, *Alii Donati . . . Commentum Terenti*, vol. i (Leipzig, 1902).

EUBŌA, MĜh. pron. év'vi-á (Lat., from Gk. Εὐβοία, *Eubōia*, rich in cattle, from *ev*, *eu*, well + *βovs*, *bous*, ox, cow; unofficial modern Gk. and Turk. *Egripo*; It. *Negroponte*). A long, narrow island of Greece, stretching along the northeast coast of Loeris, Boeotia, and Attica, from which it is separated by a narrow channel. The northwestern part of this is the Channel of Atalante (the Eubœan Sea of the ancients), at one point less than 2 miles in width. At Chalceis the island is separated from the mainland by a very narrow strait, called the Euripus, but a few rods in breadth. At the north the Channel of Trikeri separates Eubœa from Thessaly, of whose eastern mountains, Ossa and Pelion, the Eubœan Range is a continuation. The extreme length of the island is about 100 miles; its breadth varies from 30 miles to about 4. Its area is 1438 square miles. The island is intersected by a chain of mountains running northwest and southeast, and attaining in the centre, in the range of Mount Delphi (Gk. Δελφί, ancient Δελφός), an elevation of about 5725 feet. In ancient times copper and iron were mined in the island, and Carystus was the source for the green and white Cipollino marble, much used in ancient Rome. The mountains are still well wooded, and in the north are hot sulphur springs, much sought in ancient and modern times for their medicinal qualities. There is an abundance of good pasturage, and the valleys on the west coast are fertile, especially the famous Lelantian Plain, between Chalceis and Eretria; for this plain the two cities long fought. The chief products are oil, wheat,

fruit, and honey. The inhabitants are chiefly engaged in cattle breeding; they export wool, hides, cheese, oil, and grain. The chief towns are Chalceis (q.v.) on the Euripus and Carystus on the south coast. Greek tradition told of Abantes and Dryopes, immigrants from the mainland of Greece, as the earliest inhabitants. Later Ionians from Attica founded the ancient cities of Chalceis and Eretria, which sent colonies to Italy, Sicily (see CUMÆ; NAXOS; REGGIO DE CALABRIA: this town was founded from Cumæ, via MESSINA), and especially to Chalcidice, on the coast of Thrace. (See also ARTEMISIUM.) In 506 B.C. Chalceis was conquered by the Athenians, and after the Persian wars the whole island came under their control. (For Eubœa and the Persian Wars, see ERETRIA; GREECE, *History*, Ancient History.) After the Peloponnesian War Eubœa became independent and was the scene of intrigues and fighting between the Athenian, Theban, and Macedonian parties, until the battle of Charonea (338 B.C.) brought it under the power of Macedon. Under the Romans it had a nominal independence from 194 to 146 B.C., when it became part of the Province of Macedonia. The conquest of Constantinople by the Crusaders in 1204 A.D. brought the seaports under the rule of the Venetians, who after many petty wars became masters of the whole island in 1366; during Venetian rule the island was highly prosperous. It was taken by the Turks in 1470 and remained in their possession until the Greek Revolution. In 1830 it was made part of the new Greek state, of which it now forms, with some minor islands, a nomarchy. Area of nomarchy, 1621 square miles; pop. (1907), 116,903. Consult: Baumeister, *Topographische Skizze der Insel Eubōia* (Lübeck, 1864); Bursian, *Geographie von Griechenland*, vol. ii (Leipzig, 1873); Geyer, *Typographie und Geschichte der Insel Eubōia* (Berlin, 1903); Baedeker's *Handbook of Greece* (4th Eng. ed., Leipzig, 1909).

EUBULIDES, á-bŭ'lí-dēz (Lat., from Gk. Εὐβουλίδης, *Euboulidēs*), of MILETUS. A Greek philosopher of the Megarian school in the fourth century B.C. He is credited with the invention of several of the most false and captious syllogisms of his school. He was an opponent of Aristotle, whose writings he repeatedly censured, and whose character he calumniated. Demosthenes is said to have studied dialectics under him. See MEGARA; EUCLID OF MEGARA.

EUBULIUS. See METHIDIUS.

EUBULUS (Lat., from Gk. Εὐβουλος, *Euboulos*). An Athenian orator and statesman, contemporary and opponent of Demosthenes. He was of the peace party in Athens and became administrator of the city finances. He was succeeded in this office by Lycurgus. Eubulus was the friend of Æschines (q.v.) and was concerned in all the events of interest during the middle of the fourth century. At first he opposed the Macedonians, but later, won over by Philip, he became a warm supporter of the Macedonian cause. Consult: Beloch, *Griechische Geschichte*, vol. ii (Strassburg, 1897); Goodwin's edition of Demosthenes' *De Corona* (Cambridge, 1901); Francotte, *Les finances des cités grecques* (Liège, 1910).

EUBULUS. A Greek poet of the Middle Comedy, who flourished about 375 B.C. He is said to have written 104 plays, mainly on mythological subjects. Some of his works parodied the early tragedies, particularly those of Eurip-

ides. Fifty titles and the extant fragments of his plays are collected in Meineke, *Fragmenta Comicoorum Græcorum* (Berlin, 1839-57), and in Kock, *Comicoorum Atticorum Fragmenta*, vol. ii (Leipzig, 1884).

EUCAINE—B, $C_{12}H_{21}NO_2$, is a proprietary, unofficial analogue of cocaine, much less toxic, and used in the eye, on mucous surfaces or hypodermically as a local anæsthetic. In the form of *Beta-eucaine-lactate* the drug is more soluble and has the same action. It is also used for intraspinal anæsthesia.

EUCALYPTOC'RINUS. An aberrant genus of fossil Crinoidea, especially remarkable for the fact that the 20 arms rest in deep vertical compartments which are formed by 10 partitions attached to the outer walls of the tegmen and supported by the interbrachials and interdistichals. The genus is found in the Silurian beds of Scotland and England and the Niagara group of North America.

EUCALYPTUS (Neo-Lat., from Gk. εὖ, *eu*, well + κάλυπτος, *kalyptos*, covered, from κάλυπτειν, *kalyptein*, to cover). A genus of trees and shrubs of the family Myrtaceæ, embracing about 150 species, all natives of Australia and Tasmania except four or five, which are found from the Malay Peninsula southward through the East Indies. The trees, of striking appearance, are quite characteristic of the Australian forests. They have entire, leathery leaves that contain considerable volatile oil. Upon the young shoots of many species the leaves are opposite and have their upper and lower surfaces disposed as in ordinary plants.

On the older twigs the leaves are arranged alternately upon the stem; each leaf is unsymmetrical with respect to its median vein and is so placed on the stem as to present its edge towards the sun—a protective device to prevent excessive transpiration in the hot climate in which the trees abound. *Eucalyptus* trees are among the most valuable plants of the Australian forests. Their timber is so varied as to meet almost every requirement, some kinds surpassing most timbers in their great utility. On some species is noted the occurrence of considerable quantities of manna, a hard, brittle, sweet substance containing a form of sugar known as melitose. Many species yield a kind of kino, an astringent resin, which is used in medicine and various manufactures. Tannin is a product of the bark of others, and from the leaves an oil is distilled that has many pharmaceutical and other uses, while from still others, called "stringy barks," are obtained fibers used for cordage, paper manufacture, and thatch for buildings. *Eucalyptus* trees have attained a more or less deserved reputation for planting in malarial districts. They are rapid-growing and present a large leaf surface through which enormous quantities of water are given off to the air. It is probable that their beneficial action is to be attributed to their drying the soil in this way rather than to any volatile substances given off by the leaves. Whatever their action, these trees have been advantageously introduced into the Roman Campagna, Cape of Good Hope, the lake region of Algiers, and elsewhere, in regions formerly noted for the presence of malaria. The species first planted with this object in view was *Eucalyptus globulus* (for illustration, see Plate of EDELWEISS), but *Eucalyptus robusta* and *Eucalyptus urnigera* are said to be better adapted to this

purpose. Among the more conspicuous of the many timber trees belonging to this genus is the Jarrah wood (*Eucalyptus marginata*). This tree often attains a height of 80 feet without lateral branches, and with a diameter at the base of 5 feet. The timber is heavy, very hard, and is especially adapted to wharf, ship, and other marine uses, it being rated very highly on account of its resistance to the attacks of the shipworm and other borers. Its immunity is believed to be due to the large amount of astringent resin in the timber rather than to the hardness of the wood. *Eucalyptus amygdalina* is perhaps the largest, or at least the tallest, tree known. Trees 400 feet tall are reported as rather frequent, and one measured in south-east Australia was 471 feet in height. Another had a diameter of over 20 feet at the base, which was considerably buttressed, 12 feet at 13 feet from the ground, and 5 feet at a height of 210 feet. The timber of this species is extensively used in carpentry, as it is easily worked and does not warp readily. The tree is of rapid growth; specimens in southern France attained a height of 50 feet in eight years. The blue gum (*Eucalyptus globulus*) is a tree of rapid growth, attaining a height of 350 feet, and furnishes timber equal to the best oak or ash. It is extensively used for outdoor carpentry, telegraph poles, railway ties, etc. The Karri-Eucalypt (*Eucalyptus diversicolor*) has been described as the king of the Australian forests, and it certainly is the giant tree of the southwestern part of the continent. It is a graceful and grandly handsome vegetable production, of a growth of exceeding straightness, towering skywards, so that a forest of them looks like avenues of gigantic candles. On the Warren River the Karri gums attain an extreme height of 300 feet, with over 180 feet to the first limb, and are from 20 feet to 30 feet in circumference at the base. Locally it is known also as the white gum from its appearance. The leaves of *Eucalyptus globulus* are extensively used for the oil they contain. It is obtained by distillation, is a valuable antiseptic, has a peculiar camphor-like odor, and is extensively used in medicine and various arts. The principal constituent of the oil is eucalyptol, which is used as a diuretic, stimulant, and antiseptic, being administered in certain forms of intermittent fevers and in the dressing of wounds.

On account of their rapid growth and value for many purposes in Australia, numerous attempts have been made to introduce many of the species of *Eucalyptus* into California, Arizona, Florida, and elsewhere. Some of the species that are most highly prized in Australia have proved failures in California, for various reasons. The more important species for commercial planting in California are said to be the blue gum (*Eucalyptus globulus*), the sugar gum (*Eucalyptus corymocalyx*), the gray gum (*Eucalyptus tereticornis*), and the red gum (*Eucalyptus rostrata*). In Arizona most of these species have proved satisfactory when planted in the lower valleys, and in addition the desert gum (*Eucalyptus rudis*), the narrow-leaved ironbark (*Eucalyptus crebra*), and the red box (*Eucalyptus polyanthema*) have been found more resistant to cold and arid conditions than other species tested. In Florida, while specimen trees of a number of species are common southward from the central part

of the State, their value for commercial planting has not been determined.

Botany Bay Kino, a secretion of many of the species of *Eucalyptus*, is used in medicine as a substitute for kino (q.v.). It is a resin having astringent and tonic properties. *Eucalyptus resinifera* was formerly considered the species which produced this substance, but a number of other species are believed to yield kino in even greater quantity. When the bark is wounded, a red sap flows freely and hardens in the air into irregular, inodorous, nearly black masses. It is also found in cavities in the trunks of the trees, is commonly called red gum, and is used as a constituent in lozenges for affections of the throat. In small, thin fragments it is of a ruby-red color. It is said to contain eucalyptin, a substance analogous to tannin. From a single tree as much as 500 pounds of kino may be obtained in a season. *Eucalyptus citriodora* is frequently grown in pots in hothouses for its lemon-scented leaves. The oil obtained by the distillation of the leaves of this species is used in perfumery.

For extended accounts of the various species of *Eucalyptus* and their uses, see J. H. Maiden, *Native Useful Plants of Australia*, and *The Descriptive Atlas* of the late Baron F. von Mueller, who has contributed more to the knowledge of *Eucalyptus* than any other person. For the status of the Eucalypts in the United States, consult: *Arizona Station Bulletin* 60; *California Experiment Station Bulletin* 196; *U. S. Dept. of Agriculture, Forest Service Bulletins* 35, 87.

EUCHARIST. See LORD'S SUPPER.

EUCHLO'RINE (from Gk. *eu*, well + *χλωρός*, *chlōros*, greenish yellow). A bright-yellow gas that is generated when potassium chlorate is treated with hydrochloric acid. It was first prepared by Sir Humphry Davy, who believed it to be a new oxide of chlorine, but later investigations have shown it to be a mixture of free chlorine and chlorine peroxide in varying proportions. It is a more powerful oxidizing agent than chlorine itself and is used for bleaching purposes and as a disinfectant.

EUCHRE, ūkēr (apparently from Ger. *Juch*s, joke, from the "joker" in the pack, from MHG. *juch*, *ju*, an exclamation of joy). A game of cards said to be of German origin, but now very popular in the United States. Usually 32 cards are used, the twos, threes, fours, fives, and sixes being rejected, but sometimes sevens and eights are also thrown out. Before the game is started the players cut for deal, after which the cards are cut by the person at the right of the dealer. Five cards are dealt to each player, by two at a time, and three at a time, or vice versa. The dealer turns up the top of the undealt cards for trumps. In suits not trumps the cards rank as at whist, from ace down; in the trump suit the knave (termed the right bower) is the highest trump, and the other knave of the same color, either black or red (termed the left bower), is the next highest, this card being, of course, omitted from the suit to which it would otherwise belong. The game is most enjoyable when played by four persons; but two, three, or even more than four persons may play, if the rules be adapted accordingly. In two-handed euchre the non-dealer looks at his hand and decides whether he will play it. If he be satisfied and think he can make three tricks, he "orders it up." The dealer then discards his lowest and least

useful card, and takes the trump card into his hand; in this case, however, the dealer must succeed in taking three tricks, or he is "euchred," and his opponent scores two points. If the nondealer be not satisfied with his hand, he says "pass." The dealer then has the option of taking up the trump as before, or of passing also. If the trump be ordered up or taken up, the play of the hand commences; if both players pass, the dealer places the trump card face upward underneath the pack, called "turning it down." The nondealer has then the privilege of naming the suit which shall be trumps, which must be another than that previously turned up. If he "make" a trump, he must succeed in taking three tricks or he is euchred; but if he pass it again, the dealer has the option of making it. If both pass a second time, the hand is thrown up, and the other player deals. When the card turned up is red, and the trump is made red, it is called "making it next"; the same with black. If the trump be made a different color from the turn up, it is called "crossing the suit." If the hand be played, the nondealer leads; the dealer plays to the card led. He must follow suit if able, otherwise he may play any card he pleases. The highest card of the suit led wins the trick; trumps win other suits. The winner of the trick leads to the next. If a player make all five tricks, he scores a "march," equal to two points; if he make three or four tricks, he scores one point.

In three-handed euchre the option of playing or passing goes to each in rotation, beginning with the player to the dealer's left. The player who orders up, takes up, or makes the trump, plays against the other two, and if they succeed in euchring him, each of them scores two points. This is often termed "out-throat euchre," because any one of the three players is liable to be opposed by the other two.

Four-handed euchre is generally played with partners, who are cut for and sit opposite each other as at whist; if a player have a strong hand, he can decide to "play alone" single-handed against the two adversaries, and his partner cannot object; a player cannot order up his partner's trump unless he plays alone. Should the lone player succeed in making a march, he scores four; if he win three or four tricks, he scores one; if he fail to win three tricks, the opponent scores two. Sometimes, as in railroad euchre, a blank card called "little joker" or "the joker" is added, and is the highest card in the pack, the bowers following; sometimes it is agreed upon to allow the player who makes more than five points to carry the surplus (called a lap) to the next game; or to allow a "lone" player to call for his partner's best card. In French euchre only 24 cards are used, all below the nines being discarded. Another French variety called "Napoleon" has been very popular in England in recent years. After the deal the players are called upon in rotation to declare how many tricks they can take, the dealer last unless some other player shall have declared he can take the whole five tricks; if he does not, he is euchred; if he does, he collects double chips from each player; if less than five tricks is the highest bid, and he wins the number he declares, he collects single chips from each player.

Progressive Euchre. A popular form of the game, in which a large number of players take

EUCALYPTUS

1. THE BLUE GUM (*Eucalyptus globulus*) showing its habit when growing alone.

2. AN AVENUE OF EUCALYPTUS TREES.
•

part, the players being seated at tables numbered consecutively from one upward to as many as may be necessary. The players being seated, four at each table, the games begin according to the regular four-handed game. No. 1 is the head or king table, and the players seated at this govern the game as far as time is concerned. The signal is given by ringing a bell at the head table. Lone hands only count two points at this table. If there is a tie at any of the other tables, the winner is decided by cutting the cards or dealing another hand. The progression consists of the winners moving from a lower table to the next higher, the losers remaining in their seats. The game continues to revolve in this fashion until the time fixed for the limit of the game. Each player keeps tally of the games won or lost individually. These games are then summed up. To the two who have won the most games the first prize is awarded.

EUCKEN, oik'en, RUDOLF CHRISTOPH (1840-1926). A German philosopher. He was born at Aurich, East Friesland, and studied philology, history, and philosophy at Göttingen and Berlin. He was professor of philosophy at Basel from 1871 to 1874 and thereafter held the corresponding chair in the University of Jena. He became one of the leaders of the revolt in Germany against the tendency to treat man and life from the point of view solely of the physical and biological sciences, and emphasized the spiritual interests. His inspirational style has made him very popular among a wide circle of readers. He was awarded the Nobel prize for literature in 1908 and received honorary degrees from various foreign and American universities. In 1912-13 he was an exchange professor at Harvard University and in 1914 at the universities of Tokio and Kyoto, Japan. His works include: *Geschichte und Kritik der Grundbegriffe der Gegenwart* (1878; 2d ed., 1893; Eng. trans., *The Fundamental Concepts of Modern Philosophical Thought*, 1880); *Beiträge zur Geschichte der neuern Philosophie, vornehmlich der deutschen* (1886); *Die Philosophie des Thomas von Aquino und die Kultur der Neuzeit* (1886); *Die Einheit des Geisteslebens* (1888; Eng. trans., *The Life of the Spirit*, 1909); *Die Lebensanschauungen der grossen Denker* (1890; 3d ed., 1899; Eng. trans., *The Problem of Human Life as Viewed by the Great Thinkers* (1910); *Der Kampf an einen geistigen Lebensinhalt* (1896); *Geistige Strömungen der Gegenwart* (3d ed., 1904; Eng. trans., *Main Currents of Modern Thought*, 1912); *Grundlinien einer neuen Lebensanschauung* (1907; Eng. trans., *Life's Basis and Life's Ideal*, 2d ed., 1912); *Religion und Life* (1911); *Can we Still be Christians?* (1914). His *Collected Essays* were translated and edited by Meyrick Booth (London, 1914). Among his articles which have been translated into English are the following: "Liberty in Teaching in the German Universities" (1897); "Are the Germans still a Nation of Thinkers?" (1898); "Progress of Philosophy in the Nineteenth Century" (1899); "The Finnish Question" (1899); "The Philosophy of Friedrich Froebel" (1900); "The Present Status of Religion in Germany" (1901). Consult: Pöhlmann, *R. Euckens Theologie mit ihren philosophischen Grundlagen* (Berlin, 1902); Siebert, *R. Euckens Welt und Lebensanschauung* (Langensalza, 1904); Gibson, *Rudolf Euckens's Philosophy of Life* (New York, 1907).

EU'CLASE (from Gk. *eû*, *eu*, well + *klâsis*,

klasis, break, from *κλᾶν*, *klan*, to break). An aluminium and glucinum silicate that crystallizes in the monoclinic system. It is a transparent, pale-green, sometimes blue, mineral, found chiefly in schistose rocks in Brazil, especially at Villa Rica, and also in the southern Ural. Its great hardness and its capacity for taking a polish make it of value as a gem stone, but its rarity prevents its extensive use. It is also called *prismatic emerald*.

EUCLID, ū'klīd (Gk. *Εὐκλείδης*, *Eukleides*). The most famous of the Greek writers on geometry. He flourished at Alexandria, but nothing is known of his life except that Proclus tells us that he lived in the time of Ptolemy I (who reigned 306-283 B.C.). It is probable that the period of his greatest activity was in the neighborhood of 300 B.C. His fame was so great among the Greeks that he was called *δ στοιχειωτής*, 'the author of the Elements,' and even to-day the name Euclid is synonymous with elementary geometry. His *Στοιχεῖα*, or 'Elements,' were well known to the Arabs, a portion having been translated in the time of Harun-al-Rashid, a second (complete) translation being made under Al-Mamun, and other translations appearing later. It was translated from Arabic into Latin by Adelard of Bath (c.1120), from a copy obtained in Spain; and this translation, or this one revised by Giovanni Campano (1260), was printed in 1482 at Venice. It was also translated, at least in part, by other scholars of the twelfth century. Who it was who first translated the work from the Arabic is, however, quite unknown. There is internal evidence to lead to the belief that Plato of Tivoli, Adelard, and Campano all had access to a common translation. Billingsley's translation from the Latin into English appeared in 1570. The extant works unquestionably ascribed to Euclid are: the *Elements* (*Στοιχεῖα*); the *Data* (*Δεδομένα*); the *Phenomena* (*Φαινόμενα*); the *Optics* (*Ὀπτικά*); the *Reflections* (*Κατοπτρικά*); the *Division of the Scale* (*Κατασκή κανόνος*), and a work, *De Divisionibus*, known only through the Arabic. The best editions of Euclid's works are: Heath, *The Thirteen Books of Euclid's Elements* (3 vols., Cambridge, 1908); Peyrard, *Les œuvres d'Euclid en grec, en latin et en français* (3 vols., Paris, 1814-18); Heiberg and Menge, *Opera Omnia* (7 vols., Leipzig, 1883-96). One of the best biographies of Euclid is that by De Morgan, in Smith's *Dictionary of Greek and Roman Biography* (under *Eukleides*). Consult also Gow, *History of Greek Mathematics* (Cambridge, 1884), and the authorities referred to under MATHEMATICS.

EUCLID, or **EUCLIDES**, of MEGARA (Gk. *Εὐκλείδης*, *Eukleides*). A native of Megara (fifth century B.C.), founder of the Megarian school of philosophy. He was early influenced, apparently, by the works of Parmenides (q.v.), from whom he learned not only philosophy, but the art of disputation. The fame of Socrates attracted him to Athens, where he became a devoted follower of the great teacher (consult Aulus Gellius, 7, 10). He established a school of his own at Megara, the teaching of which was distinguished by its combination of Socratic and Eleatic principles. (See SOCRATES; ELEATIC SCHOOL.) To Euclid, as to Socrates, virtue was knowledge. Euclid held to the unity of Being, as taught by Parmenides. This self-identical Being, he taught, is the only reality and constitutes the good; it is not sensuous but intellectual being, i.e., reason, truth, which is for man

the *summum bonum*. After Socrates' death (399 B.C.) Plato and other disciples attached themselves for a time to the Megarian school. From Euclid Plato probably got the germs of his doctrine of ideas (*εἶδη*), a technical term, which Euclid introduced into philosophy. Euclid devoted himself especially to dialectics or logic. In antiquity six dialogues were current under Euclid's name, but their authenticity was doubted; of these nothing but the titles has survived. See EUBULIDES.

Consult: Deychs, *De Megaricorum Doctrina*, etc. (Bonn, 1827); Mallet, *Histoire de l'école de Mégare* (Paris, 1845); Hartenstein, "Ueber die Bedeutung der Megarischen Schule," in his *Historisch-philosophische Abhandlungen* (Leipzig, 1870); Ritter and Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913); Zeller, *Philosophie der Griechen*, ii (Leipzig, 1889); Ueberweg, *History of Philosophy*, trans., vol. i (New York, 1872); Gomperz, *Greek Thinkers*, vol. ii (ib., 1905); Windelband-Bonhöffer, *Geschichte der antiken Philosophie* (Munich, 1912); Burnet, *Greek Philosophy*, Part I (London, 1914).

EUDÆMONISM (Gk. *εὐδαιμονισμός*, *eudaimonismos*, thinking one happy, from *εὖ*, eu, well + *δαίμων*, *daimōn*, genius, spirit). The Aristotelian view that the chief end of human life is happiness, and that happiness is not pleasure, but an activity desirable not as a means to some further end, but for its own sake. What this activity is, is discoverable, according to Aristotle, by ascertaining what the distinctive function of man is. The distinctive function of man is an activity of the soul in accordance with reason. Hence human happiness is the activity of soul in accordance with virtue, virtue being the mean between excess and defect as determined by reason. Pleasure is an essential element in such a life, for "pleasure and life are yoked together and do not admit of separation, as pleasure is impossible without activity and activity is perfected by pleasure." See EUDÆMONISM.

EUDÆMUS (Lat., from Gk. *Εὐδῆμος*), OF RHODES. A Greek philosopher. He was a disciple and friend of Aristotle (q.v.). He composed a number of works defending the doctrine of his master and is probably the author of the *Eudemian Ethics*, published with Aristotle's writings, and in large part a reproduction of Aristotle's own work, the so-called *Nicomachean Ethics*. Eudemus also wrote, among other books, a history of mathematics and astronomy, which, however, is not extant. A summary of it appears, however, in a commentary on Euclid the mathematician written by Proclus (c.410-485 A.D.), and numerous extracts are found in the works of later writers. Spengel collected the fragments of these works that still exist (1866; 2d ed., 1870). Mullach also published them in his *Fragmenta Philosophorum Græcorum*, vol. iii (1881). Consult also Gow, *History of Greek Mathematics* (Cambridge, 1884), and Ueberweg-Prächter, *Grundriss der Geschichte der Philosophie* (10th ed.).

EUDÆS. See ODO.

EUDÆS, *ed* (also called EUDON, EUDO, and ODO), DUKE OF AQUITAINE (?-735 A.D.). He was independent ruler of southern France from the river Loire to the Pyrenees. In 721 he signally defeated the Arabs under Es-Samah, who had besieged his capital of Toulouse. A treaty with Austrasia was broken in 731, and Charles Martel began to harass northern Aquitaine.

At this juncture the Arabs, commanded by Abd-er-Rahman, reinvaded France. Eudes appealed to Charles, and a joint army, directed by the latter, won the decisive victory of Tours (732, known in French history as the battle of Poitiers). Consult Vie and Vaissette, *Histoire générale de Languedoc* (new ed., 16 vols., Toulouse, 1872-1904).

EUDÆS, *ed*, JEAN, VENERABLE (1601-80). The founder of the Roman Catholic congregation of the Eudists. He was born at Ri, France, Nov. 14, 1601, educated at the Jesuit College at Caen, entered the Congregation of the Oratory in Paris (1623), was ordained priest (1625), rose to be the superior of the Oratory at Caen (1639), and then founded in 1643 the Congregation of the Mission Priests of Jesus and Mary for the purpose of giving instruction to priests in practical and missionary work. The members are called, commonly, Eudists. They resemble the Oratorians in that they are all priests, take no vows, and are at liberty to leave the congregation when they please. They are under episcopal jurisdiction. Their rule was approved by the Pope in 1674. They met the rivalry and jealousy of the Oratorians, and the more since the latter were more or less affected by Jansenism, which the Eudists resisted. Seminaries were opened in various places before the death of Eudes at Caen, Aug. 19, 1680. The congregation was in great favor under Louis XVI, fell in the confusion of the time and was dissolved in 1794, but was reorganized in 1826. The "Law of Associations" suppressed the houses of the congregation in France. In Canada in 1914 they had 15 establishments and about 150 priests. In 1641 Eudes founded the Order of Daughters of Our Lady of Charity of the Refuge, for the rescue and restoration of fallen women, which under slightly different names still exists. In 1903 Leo XIII bestowed on him the title "Author of the liturgical worship of the Sacred Heart of Jesus and the Holy Heart of Mary." The miracles proposed for his beatification were approved in 1908. Consult Montzey, *Le père Eudes et ses instituts* (Paris, 1860).

EUDIOMETER (from Gk. *εὐδῖος*, *eudios*, clear weather + *μέτρον*, *metron*, measure). A graduated glass tube used in the analysis of gases. Joseph Priestley used such an apparatus to determine the quantity of oxygen in atmospheric air; and hence the name, which signifies "measure of purity." A eudiometer may be either straight, U or V shaped. Near its sealed end it may be provided with platinum electrodes fused into the glass; by means of these, gases may be caused to combine in the tube under the influence of electric sparks, and then the change of volume caused by the reaction is directly shown by the eudiometer.

EUDOCIA (Lat., from Gk. *Εὐδοκία*, *Eudokia*). The name of several Byzantine princesses, of whom the most important, known at first as Athenais, was later the wife of the Emperor Theodosius II. She was born about 393, the daughter of the sophist Leontius, or Leon, and was educated by her father, especially in rhetoric and literature. Her accomplishments and her singular beauty were reckoned by Leontius a sufficient fortune, for at his death he left all his property to her two brothers. To get a share of the property Eudocia appealed against her brothers to the Emperor at Constantinople. Pulcheria, the sister of Theodosius, was inter-

ested in the maiden and thought she would make a suitable wife for the Emperor. She was married to the Emperor in 421 A.D. For many years, however, Pulcheria ruled in the Imperial household and councils, Eudocia, according to Nicephorus, "submitting to her as mother and Augusta"; but in 447 a quarrel broke out between them in regard to the Eutychian heresy, of which Eudocia had become a supporter. (See EUTYCHES.) At first Eudocia was triumphant, and Pulcheria was banished; but in a short time the Emperor was reconciled to his sister and treated Eudocia so harshly that she retired to Jerusalem, where she died 460-61 A.D. Her latter days were spent in works of piety and charity. Through the influence of the famous Simeon Stylites, she was induced to renounce Eutychianism and become an orthodox Catholic Christian. She wrote a poem in heroic verse on the victory obtained by the troops of Theodosius over the Persians, 421 or 422 A.D.; a paraphrase of eight books of Scripture; a paraphrase of Daniel and Zechariah; and a poem in three books on the history and martyrdom of Cyprian and Justina. A work called *Homocentones*, composed of verses taken from Homer, and so arranged as to give a history of the fall of man and of his redemption by Christ, has also (but without sufficient reason) been attributed to her. Consult: Gregorovius, *Athenais* (Leipzig, 1892); Ludwich, *Eudocia Augusta Carminum Reliquiae* (Königsberg, 1893); *Cambridge Medieval History*, vol. i (New York, 1911).

EUDO DE STELLA. See EON.

EUDOXIA FEODOROVNA, fâ'ô-dô-rôv'nâ (1669-1731). A czarina of Russia. She was the daughter of the Boyar Feodor Lopukhin, and at the age of 19 was married to Peter the Great, who was at that time 17. Her family belonged to the Conservative party, and this fact and her staid piety alienated Peter from her. In 1698, apparently for refusing to agree to a divorce, she was imprisoned in the convent of Susdal. Upon the trial of her son Alexis she was brought to Moscow (1718), and was tried for adultery and forced to confess her guilt; and upon the condemnation of Alexis she was transferred to the monastery of Staraya Lodoga, near Schlüsselburg. In 1728 the accession to the throne of her grandson, Peter II, enabled her to return to Moscow, where she died.

EUDOXUS (Lat., from Gk. Εὐδοξος, *Eudoxos*) (c.408-355 B.C.). One of the most prominent of the Greek mathematicians. He was born in Cnidus, was a pupil of Archytas, who was head of the Pythagorean school at Tarentum, and studied for a few months under Plato. He founded a school at Cyzicus. Diogenes Laërtius speaks of him as an astronomer, physician, legislator, and geometer. It is thought that Euclid, v, and xiii, 1-5, dealing with proportion and the five regular polyhedra, is largely due to him. He is said to have invented a curve called the *ἵπποκρήνη* (horse fetter), like an 8 on its side.

EUDOXUS, or CYZICUS. A Greek explorer, who in the latter part of the second century B.C. explored, for Ptolemy Euergetes, the Arabian Sea. Later, working independently, he made two voyages along the west coast of Africa. Strabo made use of his discoveries. Consult Bunbury, *History of Ancient Geography*, vol. ii (London, 1879).

EUFULA. A city in Barbour Co., Ala.,

VOL. VIII.—11

80 miles by rail east-southeast of Montgomery, on the Chattahoochee River, and on the Central of Georgia Railroad (Map: Alabama, D 4). It is a shipping point of some importance and has manufactures of cotton goods, cottonseed oil, buggies, and fertilizers. The water works and lighting plant are owned and operated by the city. Pop., 1900, 4532; 1910, 4259.

EUGANEAN HILLS (named after the ancient Italic tribe of *Eugaine*). A range of hills in the western part of the Province of Padua, near Padua, north Italy (Map: Italy, F 2). They are of volcanic formation and quite isolated. The highest point, Monte Venda, has an altitude of over 1900 feet. The range contains a number of mineral springs and valuable stone and marble quarries.

EUGANEL. See EUGANEAN HILLS.

EUGEN, oi-gân', FRIEDRICH KARL, DUKE OF WÜRTTEMBERG (1788-1857). A Russian general, born at Oels, Germany. His father's sister was the wife of the Emperor Paul of Russia. While still a child, he was created major general. He participated in the campaign of 1806-07 in Prussia and of 1810 in Turkey. He was made lieutenant general after the battle of Smolensk (Aug. 17, 1812) and distinguished himself in the engagements at Borodino, Tarutino, Krasnoi, Lützen, Bautzen, Kulm, and Leipzig. He was commander of the Seventh Russian Army Corps during the Russo-Turkish War of 1828 and retired from the service after the Peace of Adrianople, devoting himself to study. He composed some music, including Lieder, symphonies, and an opera *Die Gesterbraut*, which was produced in Breslau in 1830. His principal works are *Erinnerungen aus dem Feldzuge des Jahres 1812 in Russland* (1846) and *Memoiren* (1862), a volume of interesting recollections.

EUGENE, ù-jên'. A city and the county seat of Lane Co., Oreg., 124 miles by rail south by west of Portland, on the Willamette River, and on the Southern Pacific, the Oregon Electric, and the Portland, Eugene, and Eastern railroads (Map: Oregon, B 3). The University of Oregon, opened in 1876, and the Eugene Bible University are situated here, and there is a Carnegie library. The city is the commercial centre for the fertile agricultural country of the upper Willamette valley, which is noted for its wealth of timber, and which also contains deposits of gold and silver. The industrial establishments include canneries, flouring, woolen, saw, and planing mills, sash, door, furniture, and excelsior factories, ironworks, and machine shops, tanneries, brickyards, etc. Under a charter of 1893 the government is vested in a mayor, elected biennially, and a municipal council. Eugene was first settled in 1854 and was incorporated 10 years later. It owns its water works and electric-light plant. Pop., 1900, 3236; 1910, 9009; 1914 (U. S. est.), 12,083; 1920, 10,593.

EUGÈNE, è'zhân', FRANÇOIS (1663-1736). A celebrated Austrian general, best known as Prince Eugène of Savoy, his full name being François-Eugène de Savoie-Carignan. He was the son of Eugène Maurice, Count of Soissons and of Olympia Mancini, a niece of Cardinal Mazarin, and was born in Paris, Oct. 18, 1663. The banishment of his mother to the Low Countries, by the order of Louis XIV, and the refusal of the King to grant him a commission in the army, so incensed Eugène against France

that he indignantly renounced his country and entered the service of the Emperor Leopold I as a volunteer against the Turks. Though barely 20 years of age and without military training, he displayed extraordinary talents in war, especially at the famous siege of Vienna in 1683. He soon rose to a high position in the army. In the war of the Coalition against Louis XIV (1689-97) he took an active part in the fighting in Italy and in 1691 was raised to the command of the Imperial army in Piedmont. It was about this time that Louis XIV offered him the bâton of a marshal of France, the generalship of Champagne, and a large pension, but Eugène refused all such advances. In 1693 he was made a field marshal of Austria, and on his return to Vienna he was placed at the head of the army of Hungary and defeated the Turks, with immense slaughter, in the famous battle of Zenta, Sept. 11, 1697. In 1701 the War of the Spanish Succession broke out, and Eugène was put in command of the army in Italy; but his forces were too small for him to accomplish anything of importance. In the year 1703, being appointed president of the council of war, he became thenceforth the prime mover of every military undertaking. He first took the command of the Imperial army in Germany, and with Marlborough gained a brilliant victory at Blenheim, Aug. 13, 1704, over the French and Bavarians. Eugène afterward saved Turin, and expelled the French from Italy in the year 1706. He shared, too, with Marlborough the glory of the fields of Oudenarde in 1708 and Malplaquet in 1709; but, being crippled in his resources by the retirement of Holland and England from the contest, he was unable to withstand the enemy on the Rhine. The defeat of his Dutch allies by Villars at Denain, July 24, 1712, was followed by other disasters, until the Peace of Rastadt (1714) put an end to the war.

In 1716, on the renewal of the war against the Turks, Eugène defeated an army of 180,000 men at Peterswardein, took Temesvár, and in the year 1717, after a bloody battle, gained possession of Belgrade. After the Peace of Passarowitz, which was concluded in the following year, he returned to Vienna, where during the succeeding years of peace he labored with unwearied energies in the cabinet. When the question of the succession to the throne of Poland brought on a new war with France (1733-35), Eugène appeared again on the Rhine; but, being now advanced in years and destitute of sufficient resources, he was unable to accomplish anything of importance. After the peace he returned to Vienna, where he died April 21, 1736, leaving an immense fortune to his niece, the Princess Victoria of Savoy. In his later years he was a patron of art and literature. Among the common people of Germany and Austria his fame lives in songs, as "Prinz Eugen der edle Ritter"; his reputation as a great military leader is firmly established.

Bibliography. The most elaborate work on Prince Eugène is that of Arneth, *Prinz Eugen von Savoyen* (Vienna, 1858); for a popular biography, consult Malleson, *Prince Eugene of Savoy* (London, 1888). Other important works are: Kausler, *Das Leben des Prinzen Eugen von Savoyen, etc.* (Freiburg, 1838-39); Von Sybel, *Prinz Eugen von Savoyen* (Munich, 1861); Heller, *Militärische Korrespondenz der Prinzen Eugen von Savoyen, etc.* (Vienna, 1848); Von Landmann, *Die Begründung der Grossmachtsteil-*

lung Oesterreich-Ungarns Prinz Eugen (Munich, 1905).

EUGENE ARAM, ū-jēn' ā'ram. A novel by Bulwer Lytton, published in 1832. See ARAM, EUGENE.

EUGENE ONEGIN, oi'gān ō-nā'gēn. An opera by Tschaiakowski (q.v.), first produced in Moscow, March 29, 1879; in the United States, Feb. 2, 1908 (New York, in concert form).

EUGENIA. See MYRTACEÆ.

EUGENICS (from Gk. εὐγενής, *eugenēs*, well born). The science of the improvement of the human race by better breeding. The modern movement for the adoption of various eugenic principles owes its inception as well as much of its present status to the consistent efforts of the late Sir Francis Galton, by whom the word "eugenics" was first employed. Galton was interested both in the scientific and in the practical aspects of the subject. On the scientific side his thinking was much influenced by the biological researches of his more famous cousin, Charles Darwin. A number of the biological principles upon which the science of eugenics rests were known, however, much earlier than Darwin's time. By means of these principles agriculturalists and stock breeders had long been making innumerable improvements in the quality of plants and animals. As Darwin himself pointed out, the principle of selection, the most fundamental of all the principles emphasized by the eugenicist, was known even to the ancient Chinese. Explicit rules of selection appear also in the works of some of the Roman classical writers. The principle of selection did not attract much notice from scientists, however, until Darwin published his *Origin of Species* (1859). This book quickly drew attention to the fact that man, like the lower animals, has passed through a long evolution in which his bodily and probably his mental characteristics have been materially altered. The notion that further modifications of a desirable sort might be brought about in the race by purposive selection of innate traits inevitably followed. Thus Darwin laid the theoretical basis for eugenics. It was the publication of Galton's two famous articles on "Heredity, Talent and Character" in *Macmillan's Magazine* for July and August, 1865, however, that may be said to have definitely inaugurated the attempt to apply biological theories to the practical problem of the improvement of the human race. Impressed by the plasticity of the physical forms of animals under the breeders' selection, Galton in these articles announced his purpose of showing more pointedly than had hitherto been attempted that the mental qualities of men are equally under control. His main thesis was that inherited ability was the chief reason for the recurrence of talent in distinguished families. This thesis he supported by a mass of biographical evidence to show how strikingly the frequent occurrence of able sons of able men indicates that mental qualities quite as much as physical traits are subject to the principles of natural inheritance. The practical conclusion he expressed in characteristically striking fashion. "How vastly would the offspring be improved," he exclaims, "supposing distinguished women to be commonly married to distinguished men, generation after generation . . . according to rules of which we are now ignorant, but which a study of the subject would be sure to evolve." Four years later, in 1869, appeared Gal-

ton's monumental work *Hereditary Genius*. In this—the classic of eugenic literature—Galton not only reiterated his belief in eugenic principles, but with highly scientific precision attempted to apply mathematical principles of the law of deviation from an average to the determination of the frequency with which the occurrence of talented progeny from talented ancestry might be expected normally. In this same work was incorporated a chapter on "Influences that Affect the Natural Ability of Nations." In this chapter are marshaled facts and arguments to show how actual modifications of human quality have occurred by means of influences that are or can be made subject to man's own control. The sterilizing effect upon the ability of subsequent generations produced by the decimation of talented men during the Spanish Inquisition is emphasized. In the same work, also, is clearly stated the evident but tremendously significant fact that, other things being equal, the group or nation which, on the average, has the least interval between generations and which possesses the highest average fertility will, through the mere fact of superiority in the rate of increase, eventually outnumber and overcome competing groups or nations.

Such, then, were the beginnings of a science, itself hardly yet beyond the period of infancy.

For many years after these beginnings little was accomplished in the immediate field of eugenics. During the latter quarter of the nineteenth century, however, practically all biologists became convinced of the soundness of Darwin's fundamental position. The public also became less skeptical of biological doctrines. When, therefore, in 1900 there occurred two events of prime importance for eugenics, the ground was prepared for widespread interest in the entire subject. The first of these two events was a lecture on "National Life from the Standpoint of Science," delivered at Newcastle, England, by Prof. Karl Pearson, perhaps the most ardent of all Galton's disciples. The other event was the rediscovery by four independent experimenters of the biological relationship now known as the Mendelian laws of heredity. Pearson's lecture abounded with such vigorous statements as these: "Bear in mind that one-quarter only of the married people of the country—say a sixth to an eighth of the adult population—produce 50 per cent of the next generation. You will then see how essential it is for the maintenance of a physically and mentally fit race that this one-sixth to one-eighth of our population should be drawn from the best and not from the worst stocks. A nation that begins to tamper with its fertility may have changed its national characteristics before two generations have passed." Coming, as it did, when the English nation was wondering whether the reverses it had sustained in South Africa might not indicate a definite deterioration in the quality of the population of the country, Pearson's lecture created a profound impression upon the public mind. On the other hand, the rediscovery of the principles which had been announced by Gregor Mendel in 1866, but which had been forgotten, created an equally profound impression upon the biologists. The result was a revival of interest in theories of heredity. Moreover, the fact that the Mendelian laws were discovered by the experimental method caused the enthusiastic adoption of this method, in biology, by investigators throughout the world.

How significant for the science of eugenics these developments have proved can be appreciated only by those who thoroughly understand the biological principles involved. For out of the differences in the views of those who, like Karl Pearson, have followed Galton's lead and the views of those who, like Prof. Charles B. Davenport, director of the Eugenics Laboratory at Cold Spring Harbor, N. Y., have been impressed chiefly with the importance of the Mendelian laws and the results of the experimental method, there has grown up a mass of controversial literature that it would be impossible to summarize here. The chief theoretical problems, however, may be indicated briefly, and their importance for eugenics pointed out. The controversial points are largely in the field of the theory of heredity. Preliminary to their discussion a short statement of certain general biological and eugenic principles accepted by both schools will be advantageous.

The fundamental doctrine of eugenics, as before indicated, is that of selection. Selection, in the biological and eugenic sense, occurs when within a species one organic type differing from another in hereditary characteristics contributes a larger proportion of progeny to the next generation than does the type from which it differs. Thus, inasmuch as certain types of feeble-mindedness tend to be hereditary, selection will operate to increase the proportion of feeble-minded in the next generation if feeble-minded persons have more progeny, on the average, than do parents who are normal. Contrary to a somewhat popular belief, however, selection in the biological sense does not occur, in all probability, if the differences in parental types are merely due to training. Thus, e.g., there is probably no selective effect when parents who differ from others merely because they are highly educated contribute a greater or less proportion of progeny to the next generation than do uneducated parents. This is because education is an acquired trait and is not transmitted by heredity. If, however, it could be proved that the educated classes are possessed, on the average, of greater natural ability than are the uneducated classes in any community, then a selective effect would be shown to occur whenever one class is more fertile than another, provided, of course, the differences in natural ability between the two classes tend to reappear in the offspring. Neither Pearsonian nor Mendelian doubts the fact that some classes of persons are more fertile than other classes, and that profound social and probably important eugenic changes are the result of such differences.

The real problem is one of heredity and may be stated as follows: *First*, do different classes of men differ in important hereditary traits? *Second*, if so, do they transmit their differences in full force or in diminished intensity? *Third*, is the transmission of significant traits to all of the progeny or only to some? *Fourth*, if only to some, what is the probability that a given proportion of the progeny will inherit a given amount of the characteristic? *Fifth*, can the characteristics of progeny be predicted in the case of individuals or only on the average for large numbers? *Sixth*, are different traits inherited independently, or, if one characteristic of an ancestor is shown to reappear in a way capable of definite statement, do other characteristics of the same ancestor reappear in the

same way? An illustration of each point will show the relation of each to the problem of better breeding. *First*, it makes little difference to the welfare of man whether blue-eyed parents tend to produce blue-eyed children. It is of profound importance if mentally gifted parents have gifted children. *Second*, if the children are gifted in a degree equal to that of their parents, the stock will not deteriorate; if, however, there is a diminished intensity of the trait inherited, the stock will become mediocre in a few generations. *Third*, if all the children inherit a desirable trait, the desirable effect, upon the next generation of the population, of a few fertile marriages of persons of talent will be greater than if only a portion of the children do so. *Fourth*, if only a portion of the children inherit the gift, the degree of effect upon the next generation will depend upon the proportionate number who do inherit the trait. *Fifth*, unless the characteristics of the progeny of particular individuals can be predicted, practical efforts to increase or diminish the fertility of particular individuals are useless. Average results would confine practical measures entirely to encouraging or discouraging the fertility of large classes of men. Action against an individual who belonged to a class whose progeny contained on the average a large proportion of persons possessing undesirable innate traits could profitably be taken only on the ground that the probability of undesirable progeny was so great that social expediency required the suppression of the stock, in spite of the possibility that the progeny of that particular individual might prove to be entirely normal.

In addition to the foregoing points there are, of course, many other important questions involved. Not the least among these is the determination in the case of a given individual whether a given trait deemed desirable or undesirable is, as a matter of fact, an hereditary trait or whether it is a trait due merely to the peculiar circumstances in which the individual's life has been passed. From the foregoing it will appear that the theoretical problems of eugenics are not simple. Thus far only a beginning has been made towards their solution. With Galton, the scientifically minded man must still confess ignorance, for the most part, of the particular rules by which to render eugenic progress a certainty. The reasons for this ignorance will appear by briefly indicating the various positions that are held by scientists of repute on some of the theoretical points just enumerated. With respect to the following statement, however, it must be remembered that not only are innumerable controversial details involved, but also that frequent additions to knowledge are being made in the details of each subject. The first of the enumerated points, of course, involves the whole eugenic question. The eugenicist holds that men differ greatly in important hereditary mental as well as physical traits. He has reputable opponents who hold the contrary. Pointing to the unity of all organic life, the eugenicist emphasizes the fact that biological laws which hold for animals and in many instances are known to be true of man's physical characteristics could hardly fail to hold true of many of his mental traits. He thinks that the known hereditary character of feeble-mindedness and of various forms of nervous diseases is but one of the more readily detected instances. He contends that the great frequency with which

eminent men are the sons or near relatives of eminent men—a fact of which there is abundant evidence in the researches of Galton and others—proves beyond a doubt that important hereditary differences exist among individuals. The extreme eugenicist may even emphasize these differences to the extent of holding that different races of men are much superior in native mental ability to others. Some scientists, on the other hand, like the late Prof. Lester F. Ward and the anthropologist Prof. Franz Boas, have held that there is little if any difference in average innate mental ability among different races. These writers also contend that the differences among individuals within any given race are far greater than whatever differences there may be among the races themselves. In consequence these writers hold that some men of every race are likely to show a high degree of ability. They hold also that eminent men have eminent progeny in large part because they provide exceptional opportunities for their offspring. Argument on these general grounds, however, is not extremely fruitful. Better results may be anticipated from the recording, generation after generation, of the various mental traits of individuals who are related by birth and deducing laws of heredity in man from facts which, to some extent at least, can be freed from the effects of environmental as opposed to hereditary influences. Work of this character has been started by Davenport at the Eugenics Record Office in Cold Spring Harbor, N. Y., and also under the direction of the Eugenics Laboratory in England. One of the most hopeful developments in this field is the so-called "Binet test," by means of which various mental traits of individuals are measured with some degree of accuracy. Another development of importance is Professor Thorndike's systematic studies, undertaken at Columbia University, to ascertain the degree of separability among mental traits (i.e., whether mental ability is a general or a complex fact). On the basis of such work as these men are doing it may become possible eventually to state positively and in quantitative form the degree to which men differ in innate traits rather than merely to assume that they do differ.

With respect to the other five questions there is a fundamental difference of approach within the ranks of the eugenicists. These differences in method yield differences in results. The five questions require quantitative analysis, and both schools present their results in statistical form. The Pearsonian, however, is always stating averages obtained from large numbers of cases. The Mendelian is always presenting the facts gleaned from experiments upon individual lines of inheritance. There have been many attempts to reconcile the results of both schools, but none have attained complete success. Other differences in the results of the two schools arise, however, from differences in underlying biological assumptions. The Pearsonians—or Biometricians, as they are often called—assume that the traits of individuals vary to a greater or less extent from a normal or usual value. For example, the average height of 683 upper middle-class English males was found by Galton to be 69.215 centimeters. Some of the individuals, of course, were taller and some were shorter—there were variations from the average height. The Mendelians, on the other hand, have studied for the most part traits that are termed alter-

native. For example, a person is either blue-eyed or he is not. It may ultimately prove that the first assumption is true with respect to some traits, and that the second is true with respect to others. The difference is a fundamental one. It is of great practical significance, also, because under certain conditions an alternative character which "Mendelizes" may entirely disappear in a single generation from certain lines of progeny. See HEREDITY, section on *Mendelian Laws*, paragraph on "Segregation."

Under such circumstances, therefore, the complete disappearance of an objectionable Mendelian trait could be brought about by selective mating in a single generation. Another difference between the schools arises from the fact that the Biometricians deal with traits as simple which upon further investigation may prove to be complex. Stature, conceivably, may be the resultant of three "unit" characters—one determining height of the cranium, another the length of neck and trunk, and a third the length of the legs. It may easily be proved that from the standpoint of eugenics, as Davenport holds, sitting height is more important than standing height. And so also with other more significant characteristics. If mental ability should prove to be the resultant of many "unit" characters, as, from the Mendelian point of view, seems probable, and if each of these "unit" characters happens to follow different modes of inheritance, as might also prove to be the case, the problem of controlling the inheritance of such a complex set of characters would evidently be one of great difficulty. Up to the present time examples of the operation of the Mendelian laws, however, have been found chiefly among the lower animals and plants. In a small number of cases only have the traits of man, thus far, been shown to follow these laws. Eye color, brachydactylism, certain forms of cataract, various affections of the skin and hair, color blindness, and night blindness are representative examples. The frequency of abnormalities in this list is due, probably, to the fact that records for several generations are required to demonstrate the law, and abnormalities attract notice more than variations in normal traits. There is little doubt that many other human traits of far more importance than these will be shown, eventually, to follow the Mendelian laws of inheritance. Until proof is adduced, however, concerning the applicability of the Mendelian laws to important mental traits in man, it is evident that the practical measures possible wherever these laws operate must await further extension of knowledge.

From the foregoing it is apparent that the problem of eugenics is essentially biological in its nature. Its future development depends upon the future of the biological sciences, and no amount of popular agitation will hasten the attainment of adequate biological knowledge.

These facts, however, in no wise militate against the practical utilization of such knowledge as is already possessed. Thus, the following suggestions of Galton made in addresses to the London Sociological Society can hardly be dismissed as useless:

"1. Dissemination of a knowledge of the laws of heredity so far as they are surely known, and promotion of their farther study. Few seem to be aware how greatly the knowledge of what may be termed the actuarial side of heredity has advanced in recent years. . . .

"2. Historical inquiry into the rates with which various classes of society (classified according to civic usefulness) have contributed to the population at various times, in ancient and modern nations. There is strong reason for believing that national rise and decline is closely connected with this influence. It seems to be the tendency of high civilization to check fertility in the upper classes, through numerous causes, some of which are well known, others are inferred, and others again are wholly obscure.

"3. Systematic collection of facts showing the circumstances under which large and thriving families have most frequently originated; in other words, the conditions of eugenics. . . .

"4. Influences affecting marriage. Social influences of all kinds have immense power in the end, and they are very various. If unsuitable marriages from the eugenic point of view were banned socially, or even regarded with the unreasonable disfavor which some attach to cousin marriages, very few would be made. The multitude of marriage restrictions that have proved prohibitive among uncivilized people would require a volume to describe.

"5. Persistence in setting forth the national importance of eugenics. There are three stages to be passed through. First, it must be made familiar as an academic question, until its exact importance has been understood and accepted as a fact; secondly, it must be recognized as a subject whose practical development deserves serious consideration; and, thirdly, it must be introduced into the national conscience, like a new religion. . . . I see no impossibility in eugenics becoming a religious dogma among mankind, but its details must first be worked out sedulously in the study. Overzeal leading to hasty action would do harm.

"The first and main point is to secure the general intellectual acceptance of eugenics as a hopeful and most important study. Then let its principles work into the heart of the nation, who [sic] will gradually give practical effect to them in ways that we may not wholly foresee." These suggestions, it will be noted, are conservative. They emphasize the study of conditions rather than hasty application of dogmatic assumptions.

Some time after they were made Galton added to them the idea that at some future time some suitable authority might be established to issue eugenic certificates to candidates excelling in physique and in mental capacity. But for the practical application of eugenic doctrine Galton relied far more on the development of social traditions in their favor than upon the enactment of positive law. The more enthusiastic eugenists have by no means been as conservative as was Galton. For example, more than one writer has advocated rather extensive sterilization of criminals. Others have demanded that various restrictions, supposed to safeguard the character of progeny, be incorporated into marriage laws. Experiments along these lines have even been attempted in various commonwealths of the United States. The most effective application of eugenic principles thus far, however, has been the segregation of the feeble-minded. No one can read the ancestral history of some of the inmates of the Training School for Feeble-minded Boys and Girls at Vineland, N. J., as given in Director Goddard's *The Kallikak Family*, without being impressed by the

frequency with which feeble-mindedness has appeared in certain family lines. After perusal the reader is likely to agree definitely with Dr. Goddard that "feeble-mindedness is hereditary and is transmitted as surely as is any other character. We cannot successfully cope with these conditions until we recognize feeble-mindedness and its hereditary nature, recognize it early and take care of it." Usually feeble-minded persons are themselves far happier properly segregated and given suitable training than if left at large in society to add abnormal progeny to the population, and there is likely to be little opposition, except that based on financial grounds, to projects for their care. The proposition to incorporate eugenic measures in marriage laws is far more likely to meet with determined opposition on the ground of improper interference with individual liberty. Thus, the practical application of eugenic doctrine is more likely to proceed along the lines of Galton's suggestions. The foundation of the research laboratories already mentioned and the establishment of various journals such as the *Eugenics Review* and Ploetz's *Archiv für Rassen- und Gesellschafts Biologie* for discussion of eugenic topics and the dissemination of knowledge is quite in keeping with those suggestions. In the judgment of those who are best acquainted with the extent of present scientific knowledge of the principles upon which eugenics rests, however, the time has not yet come for radical action. The betterment of the race by means of better breeding must, in the nature of the case, progress *pari passu* with the extension of biological knowledge. Only when the biologist has solved the problems of heredity may the eugenicist speak with authority.

EUGÉNIE-MARIE DE MONTIJO, *zhá'ne' má'ré' de mōn-tě'hō* (1826-1920). Ex-Empress of the French, wife of Napoleon III. She was born at Granada, in Spain, May 5, 1826, the second daughter of the Count of Montijo and Maria Manuela Fitzpatrick, whose father had been

United States Consul at Halaga and was a Scotchman by birth and an American by residence. Eugénie was educated at the convent of the Sacré Cœur, near Paris, and after the age of eight lived with her mother and sister in Paris. They moved in French society, though not in the most exclusive circles. Eugénie appeared in society in Paris in 1851 and fascinated every one by her beauty and amiability, Louis Napoleon, who had just been crowned Emperor, not excepted. He conceived an ardent passion for Mademoiselle de Montijo—or the Comtesse de Teba, as she was known—and after the failure of his attempt to enter the circle of European royalty through a dynastic marriage, he decided upon a marriage of inclination, offered himself to Eugénie de Montijo, and was accepted—a dénouement that was viewed by her enemies as the coup of a successful adventuress paralleling Napoleon's own *coup d'état*. The marriage took place with great pomp at Notre Dame on Jan. 30, 1853, and Eugénie was installed as Empress at the Tuileries. The birth of a son, the Prince Imperial, in 1856 served to strengthen Napoleon's hold upon his position. The frivolous nature of Eugénie and the ambition of Napoleon for a brilliant court made the Tuileries the model for luxury and extravagance in Europe. But Eugénie was the arbiter, not only of fashion, but of politics, in spite of the intervals when public policy forced Napoleon to escape from her tutelage. Her Spanish traditions had imbued her with a distrust for democracy and a devotion to the church which dictated entirely the direction of her political influence and that of a powerful group which surrounded her. Napoleon's personal convictions were more liberal, but policy as well as the influence of the Empress dictated to him an indulgent attitude towards the church. Eugénie was deficient, however, in political sagacity and failed in most of her political ventures. She favored the unfortunate Mexican expedition of Maximilian and blocked Napoleon's plans for the liberation of Italy so successfully that he was left without the confidence of either clericals or Italians. She discouraged all concessions to the democratic tide of opinion that had been swelling during the Empire and thus helped to increase the force of the Liberal opposition. Finally, in 1870, with the idea that a successful war would strengthen the dynastic prospects of her son, she made her supreme political mistake in urging Napoleon into the fatal conflict with Prussia, and, as regent during his absence in the war, she was unable to do anything to retrieve the position and fled to England as a simple traveler. She was joined there by Napoleon after his release and the downfall of the Empire, and after his death in 1873 devoted herself to the education of the Prince Imperial. Her hopes for his future were blasted by his death in Africa in the Zulu War in 1879. Thereafter she continued to reside in England in strict retirement at Chislehurst.

Eugénie has been the subject of numerous biographies and memoirs, among them being those of De Lano, *The Empress Eugénie* (London, 1894); Bouchat, *Les élégances du second empire* (Paris, 1896); Saint-Armand, *Louis Napoleon and Mlle. de Montijo* (Eng. trans. by E. G. Martin, New York, 1897); Tschudi, *Eugénie, Empress of the French* (trans. from the Norwegian by E. M. Cope, London, 1899);

Evans, *Memoirs: Second French Empire* (New York, 1905); Emile Ollivier, *L'Empire libéral* (12 vols., Paris, 1895); A. Thomas, *Le Seconde Empire* (vol. x of Jaures's *Histoire socialiste*, Paris, 1907); De Chambrier, *Le cour et la société du seconde Empire* (2 vols., Paris, 1902-06); Daudet, *L'Impératrice Eugénie* (ib., 1911); Stoddart, *The Life of the Empress Eugénie* (New York, 1906). Consult also her work, *Some Recollections from my Life* (London, 1885).

EUGENIUS. The name of four popes.—1. EUGENIUS I, SAINT. Pope from 654 to 657. He was elected from the Roman clergy in a time of strife between the East and the West over questions of doctrine and showed a spirit of compromise. He was charitable and gentle and is reckoned as a saint.—2. EUGENIUS II. A Roman Pope from 824 to 827. The important event of his pontificate was the adoption of the *Constitutio Romana* (824), which provided that the choice of Pope should be taken from the common people and given to the clergy and nobles, his consecration, however, to be dependent on confirmation by the Emperor and an oath of homage from the newly chosen pontiff.—3. EUGENIUS III, BLESSED. Pope from 1145 to 1153. A disciple of Bernard of Clairvaux. During his pontificate occurred the Second Crusade (1147-1149), which he proclaimed and Bernard preached. He was three times driven from Rome by the Republican party of Arnold of Brescia.—4. EUGENIUS IV. A Venetian, Pope from 1431 to 1447. His pontificate was a season of discord, owing to the proceedings of the Council of Basel and the attacks of enemies at Rome. The Council of Basel was convoked by his predecessor, Martin V, and showed a strong tendency to subordination. In 1434 Eugenius was compelled to flee from Rome and remained a refugee at Florence till 1443. In 1436 he attempted to dissolve the council, and in 1438 opened a new council at Ferrara and issued a bull of excommunication against the bishops assembled at Basel. The latter deposed him and set up an antipope, Felix V (1439). At the Council of Florence, which succeeded that of Ferrara (q.v.), and at which the Greek Emperor, John Paleologus II, and upward of 20 Greek bishops were present, a union was proclaimed between the Latin and Greek churches (July, 1439). The efforts of Eugenius also met with some success in effecting a temporary reconciliation with the Armenian, Jacobite, and Nestorian churches. In the midst of his troubles he fostered a crusade, which set out in 1443, only to meet disaster. He died at Rome, Feb. 23, 1447. See BASEL, COUNCIL OF; FERRARA-FLORENCE, COUNCIL OF. Consult Pastor, *History of the Popes* (London, 1906-12).

EUGIPIUS, or EUGYPIUS (c.450-?). An Italian monk, abbot of Lucullanum, near Naples. He was born at Carthage, and after studying at Rome became the pupil of St. Severin at Fariana in Noricum. He wrote *Vita Sancti Severini* (511 A.D.), an important contribution to the church history of Germany, and compiled *Thesaurus Augustinianeus*, a collection of excerpts from the works of St. Augustine. There is a monastic rule which is ascribed to Eugippius, but it was superseded by that of St. Benedict. Consult the edition of the former work by Knoell, vol. ix of the *Corpus Scriptorum Ecclesiasticorum Latinorum* (Vienna, 1885-86).

EUGNATHUS, ūg-nā'thūs (Neo-Lat., from Gk. εὐ, eu, well + γνάθος, gnathos, jaw). One of the precursors of the mudfish (*Amia*), fossil remains of which have been found in the Liassic rocks of England and the Jurassic rocks of Bavaria. The body was elongated, and covered with ganoid scales, which were strengthened on their inside surfaces with vertical ribs, and many of which were fastened to each other by peg-and-socket joints. There is a dorsal fin, a pair each of pectoral and pelvic fins, an anal fin, and a semiheterocerical tail fin.

EU'GUBINE TABLES (Lat., *Tabulae Eugubinae*). The name given to seven bronze tablets, the inscriptions on which present a comprehensive and very remarkable memorial of the Umbrian language. (See UMBRIA.) They were discovered in 1444 at Gubbio (the ancient Iguvium or Eguvium, mediæval Eugubium), where they are still preserved, having been bought by the town. The characters on four of the tablets are Umbrian, on two Latin, and on one partly Latin and partly Umbrian. The language resembles somewhat the older forms of the latter and also the Oscan dialects. The subjects of the inscriptions are directions concerning sacrificial usages and forms of prayer, and they seem to belong to two periods—those in Umbrian characters to the second century B.C. and those in Latin letters to the time of Sulla. Philip Buonarrotti first published them in a complete form in Dempster's *Etruria Regalis* (Florence, 1723-24). The real decipherment of the inscriptions was due to Karl Ottfried Müller in his *Die Etrusker* (Breslau, 1828) and Grotefend, and the final corrections and improvements were made by Bücheler (q.v.) and Lepsius in *De Tabulis Eugubinis* (Berlin, 1833), and his text (1841). A good work on the inscriptions is Bréal, *Les tables eugubines* (Paris, 1875-78). Consult also: Newman, *The Iguvine Tablets* (London, 1864); Bücheler, *Umbria* (Bonn, 1883); Von Planta, *Oskisch-umbriische Grammatik* (Strassburg, 1892-97); Buck, *Grammar of Oscan and Umbrian* (Boston, 1904); Conway, *Italic Dialects* (Cambridge, 1897). See ITALIC LANGUAGES; LATIN LANGUAGE.

EUGUVIUM. See GUBBIO.

EUEMERISM. The name usually applied to the theory which seeks to explain all mythology as distorted history. The name is derived from Euhemerus (Εὐήμερος) of Messana in Sicily, who was a contemporary and friend of Cassander of Macedon (311-298 B.C.). Sent by the King on a voyage to the south, he utilized his travels to bring his theory before the world. In his Sacred Record (Gk. Ἱερὰ Ἀναγραφὴ) he described the habits and the government found on an (imaginary) island, Panchæa, in the Indian Ocean. This enabled him to set forth his view of an ideal state. He endeavored to show that the Greek gods were merely men, who had been deified because of their power or services to mankind. He was not the first to suggest this interpretation, as it had already been applied by such writers as Hecataeus and Ephorus to various myths of the heroes connected with early Grecian history; but he carried it far beyond any previous writer in the universality of its application even to the gods. Naturally, and probably with full justice, the book brought upon its author the name of Atheist, though, considering its obviously fictitious character, it is hard to see why he should have been branded

as a deceiver. Ennius translated Euhemerus' book. Many of the later writers adopted his views, and to many of the early Christian apologists his work was a welcome storehouse of material for use in their attacks upon the heathen divinities. The theory has had defenders from the days of its founder to the present time. In the eighteenth century it was made prominent by Banier's *La mythologie et les fables expliquées par l'histoire* (Paris, 1738), and with some admixture of the allegorizing tendency is found in those writers who endeavored to interpret Greek legends as a derivation from the biblical narrative, as in the *Arca Noë* of Athanasius Kircher and others—a method which survived long, and is found even in 1893 in the *Revue d'exégèse mythologique* of the Abbé Fourier. Some elements of euhemerism may also be attributed to those theories which see the origin of all mythologies, and even all religious emotions, in the worship of ancestors and spirits of the dead. Consult: Sieroka, *De Euhemero* (Königsberg, 1868); Némethy, *Euhemeri Reliquiæ* (Budapest, 1889); Susemihl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit*, vol. i (Leipzig, 1891); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii (5th ed., Munich, 1911).

EUEMERUS. See EUEMERISM.

EULACHON, ū'lā-kōn, or **OOL'ACHAN**. See CANDLEFISH.

EULALIUS. Antipope chosen in opposition to Boniface I (q.v.) (418). The dispute occasioned the first interference on the part of the temporal authorities in the choice of a pope. The party of Boniface prevailed, and Eulalius left Rome and later resigned all pretensions.

EULENBERG, oi'len-bérk, HERMANN (1814-1902). A German physician. He was born at Mühlheim-on-the-Rhine and studied at Bonn and Berlin. At Coblenz he founded the publication entitled *Korrespondenzblatt der deutschen Gesellschaft für Psychiatrie und gerichtliche Medizin* and made investigations in regard to the prevalence of cretinism and goitre in the District of Coblenz (*Beiträge zur pathologischen Anatomie des Kretinismus*, in collaboration with Marfels, 1857). He subsequently became government counselor and medical counselor at Cologne (1860-70) and was in 1870 appointed counselor to the Ministry of Education (1870-87). From 1870 to 1890 he edited the *Vierteljahrsschrift für gerichtliche Medizin und öffentliches Sanitätswesen*. His principal works, which deal mainly with public hygiene, are the following: *Das Medizinalwesen in Preussen* (1874); *Handbuch der Gewerbehygiene* (1876); *Handbuch des öffentlichen Gesundheitswesens* (in collaboration with other specialists, 2 vols., 1881-82); *Schulgesundheitslehre* (with Bach, 2d ed., 1896).

EULENBURG, oi'len-bürk, ALBERT (1840-). A German physician, born in Berlin and educated at the universities of Berlin and Bonn. As assistant in the University Hospital at Greifswald, he published in 1864 the important treatise entitled *Die hypodermatische Injection der Arzneimittel* (3d ed., 1875), for which he received the prize awarded by the Hufeland Society of Berlin. In 1874 he was appointed professor of therapeutics and director of the Pharmacological Institute at Greifswald. He returned to Berlin in 1882 and devoted himself to researches in neuropathology, on which subject he was soon a recognized authority. Be-

sides publishing the important works entitled *Sexuale Neuropathie* (1895) and *Lehrbuch der Nervenkrankheiten* (2d ed., 1878), he became editor of the *Real-Encyclopädie der gesamten Heilkunde* (3d ed., 1893 et seq.). He was also editor of the *Encyclopädische Jahrbücher der gesamten Heilkunde* (1891 et seq.), and, in collaboration with J. Schwabe, of the *Deutsche medizinische Wochenschrift*.

EULENBURG, BOTHO, COUNT (1831-1912). A German statesman, a son of the Prussian statesman Count Botho Heinrich Eulenburg (1804-79). After studying law and holding a position as government counselor, he was a member of the Prussian Lower House in 1865-70 and was elected to the North German Reichstag as a Conservative in 1867. In 1878, as Minister of the Interior, he formulated the Socialist law of October and vigorously prosecuted the work of administrative reform. Differences arose between him and Bismarck over what the Chancellor thought to be undue leniency, and he was compelled to resign in 1881. After the withdrawal of the Chancellor, Count Caprivi, from the Prussian Premiership in 1892, Eulenburg succeeded as President of the Ministry and in the same year became Minister of the Interior. But his advocacy of strenuous measures against the social democracy was disapproved by Chancellor Caprivi, and the differences arising between the two men, especially on an amendment to the criminal code, resulted in the dismissal of both, Oct. 26, 1894. Eulenburg took his seat in the Prussian House of Lords in 1899.

EULENBURG, FRIEDRICH ALBRECHT, COUNT (1815-81). A German statesman. He was an assistant in the Department of the Interior from 1849 to 1852 and then was appointed Consul General at Antwerp and (1858) at Warsaw. In October, 1859, as head of the Eastern Asiatic expedition of the Prussian government, he conducted negotiations leading to commercial and maritime treaties with China and Japan, which were ratified on Jan. 24 and Sept. 2, 1861, respectively. Upon his return he was appointed by Bismarck Minister of the Interior (Dec. 8, 1862). After 1866 he energetically organized the administration of the newly acquired provinces of Prussia, consistently following a Conservative policy until 1878, when certain concessions which he had made to the Liberal party were opposed by Bismarck and led to his resignation, March 30, 1878. His speeches and papers were published under the title *Zehn Jahre innere Politik, 1862-72* (Berlin, 1872), and Prince Philipp Eulenburg edited his *Ostasien 1860-1862 in Briefen* (ib., 1900).

EULENBURG, PHILIPP, PRINCE (1847-1921). A German diplomat, born at Königsberg, Prussia. He served in the wars with Austria and France and studied law at Leipzig and Strassburg from 1872 to 1875. He was Prussian Ambassador to Oldenburg from 1888 to 1890; at Stuttgart (1890), Munich (1891), and German Ambassador to Vienna from 1894 to 1902, when his poor health forced him to leave the diplomatic service. In 1900 he was raised in rank from Graf to Fürst; Hertefeld was added to his title of Eulenburg; and he was made a hereditary member of the House of Lords. The attacks of Harden in the *Zukunft* in 1907 on the Imperial court and its intrigues were as unfortunate for Prince Eulenburg as for Kuno Moltke and other intimates of the Emperor. He wrote: *Rosen-*

lieder (1886; 152d printing, 1903); *Skaldengesänge* (1892); *Dichtungen* (1892); *Das Weihnachtsbuch* (1892); *Erich und Erika und andere Erzählungen für Kinder* (1893); *Abend-erzählungen, Märchen und Traume* (1894).

EULENSPIEGEL, oi'len-shp'g'el, TILL or TYLL (Ger., owlmirror). A German of clownish wit, said to have lived in the first half of the fourteenth century, whose clumsy and vulgar account of his own pranks made his life the gathering point of popular tales of mischief. A Low Saxon account of his pranks was written in 1483 and printed in 1519 in a High German version, by some attributed to Thomas Murner. It has often been edited, best by Lappenberg (1854). It was soon rendered into Czech, Polish, Italian, Danish, French, Latin, and into English under the title *Hovle-Glass*. It has been adapted for modern German readers by Simrock (1878). Its universal popularity is a striking witness to the general debased taste that prevailed at this period. It was afterward adapted by both Reformers and Catholics to their purposes. Fischart issued a metrical version in 1571. Modern imitations are: Böttger, *Till Eulenspiegel: Modernes Heldengedicht* (1850); Wolff, *Till Eulenspiegel Redivivus: ein Schelmenlied* (1875). A modern English edition, elaborately illustrated, appeared in 1860, and a translation by Mackenzie in 1890. Consult Roscoe, *German Novelists* (London, 1880), or any good history of German literature.

EULER, oi'l'er, LEONHARD (1707-83). A Swiss mathematician, one of the most remarkable of his century. He was born at Basel. Euler was sent to the University of Basel so early and was so proficient in his work that he received the master's degree at the age of 16. He studied mathematics under Johann Bernoulli at Basel and also studied theology, the Oriental languages, and medicine. In the course of his physiological researches he wrote a treatise on the nature and propagation of sound and also wrote an essay on the masting of ships, which received a prize of the French Academy of Sciences in 1727. In that year Euler went to St. Petersburg upon the invitation of Catharine I and became an associate of the Academy of Sciences. In 1730 he was made professor of physics and in 1733 professor of higher mathematics. In 1740 he became inspector of the geographical department and in the following year was called to Berlin by Frederick II to take the chair of mathematics in the Academy of Sciences, from which he was not long afterward advanced to the position of director of the mathematical class. In 1766 he was called back to St. Petersburg, where he remained until his death. Euler lost one eye as the result of a severe illness in 1735, and soon after his return to Russia in 1766 he lost the use of the other. This did not, however, hinder his mental activity, and he contributed extensively to the science of mathematics until the day of his death.

The number no less than the value of Euler's mathematical writings was very great. He wrote, aside from his separate treatises, 473 memoirs published during his life, 200 published soon after his death, and 61 others of which the publication was undertaken by P. H. and N. Fuss in 1849. Of his more important treatises, the following may be mentioned: *Mechanica sive Motus Scientia Analytice Exposita* (1736; 2d ed., 1742); *Tentamen Nova Theoria Musica* (1739); *Einleitung in die Arithmetik* (1742);

Methodus Inveniendi Lineas Curvas Maximi Minimive Proprietate Gaudentes (1744); *Theoria Motuum Planetarum et Cometarum* (1744; Ger. ed., 1781); *Opuscula Varii Argumenti* (3 vols., 1746-51); *Gedanken von den Elementen der Körper* (1746); *Lettres à une princesse d'Allemagne sur quelques sujets de physique et de philosophie* (1768-72; 2d ed. by Cournot, 1842; Ger. ed., Stuttgart, 1853; Eng. ed., New York, 1833). His textbooks were relatively less important; they include the following: *Introductio in Analysin Infinitorum* (1748; Fr. ed., 1796-97; Ger. ed., 1785-90); *Institutiones Calculi Differentialis* (1755; 2d ed., 1804; Ger. ed., 1790-98); *Institutiones Calculi Integralis* (3 vols., 1768-70; 3d ed., 4 vols., 1824-45; Ger. ed., 4 vols., 1828-40); *Anleitung zur Algebra* (1771; 3d ed., 1821; Fr. ed., 1770, 2d ed. 1795, and Paris, 1807; Eng. ed., 1818, 2d ed. 1821); *Dioptrica* (3 vols., 1769-71); *Theoria Motuum Lunae Nova Methodo Pertractata* (1772); *Opuscula Analytica* (1783-85). For biography of Euler, consult: Condorcet, *Eloge*, in *Euler's Institutiones Calculi Differentialis* and in his *Lettres à une princesse d'Allemagne*; also Fuss, *Correspondance mathématique et physique* (St. Petersburg, 1843).

EUMÆUS (Lat., from Gk. Εὐμαῖος, *Eumaios*). The faithful swineherd in the *Odyssey*, xv, who recognizes Odysseus on his return and aids him in destroying the suitors. See ULYSSES.

EUMATHIUS. See EUSTATHIUS.

EUMENES, ū'mē-nēz (Lat., from Gk. Εὐμένης) (c.360-316 B.C.). A capable general of Alexander the Great, born at Cardia in the Thracian Chersonesus. He was private secretary of Philip of Macedon and, after Philip's death, of Alexander, under whom he was also commander of the cavalry. On the death of Alexander, Eumenes became Governor of Cappadocia, Paphlagonia, and the seacoast of Pontus as far as Trapezus. With Perdiccas as an ally, he defeated Craterus, Neoptolemus, and Antipater in 321 B.C. In the next year he was himself defeated by Antigonus and retreated to Nora, on the borders of Lycania and Cappadocia, where he withstood a long blockade (320-319 B.C.). He was finally betrayed by his soldiers into the hands of Antigonus, by whose orders he was put to death (316 B.C.). With the death of Eumenes there came to an end the last effort to hold together the Macedonian Empire for the rightful heirs of Alexander the Great. His life was written by Cornelius Nepos and by Plutarch. Consult Vezin, *Eumenes von Kardias: ein Beitrag, zur Geschichte der Diadochenzeit* (Münster, 1907).

EUMENES II (†-159 B.C.). King of Pergamum (q.v.), and a son of Attalus I. He began his reign in 197 B.C. and was a faithful ally of the Romans in their war against Antiochus (q.v.) the Great. He contributed largely to the victory at Magnesia (190 B.C.) and received, in recognition of his services, the provinces of Mysia, Lydia, and Phrygia, so that he became one of the most powerful rulers in Asia. By his political sagacity in continuing friendly to Rome he greatly increased the political prestige of his realm, and his rule was marked by peace and prosperity. He was a liberal patron of the arts and sciences and attracted many scholars to his court. He completed the magnificent altar at Pergamum (q.v.), and established a library which is said to have rivalled that of Alexandria. (See LIBRARIES.) He ruled until 159 B.C. and was succeeded by his brother, Attalus II.

EUMENIDES, é-mén'i-déz (Lat., from Gk. *Εὐμενίδες*, the gracious ones, from *εὖ*, *eu*, well + *μένος*, *menos*, mind). The euphemistic name of the Erinyes. Their Latin name was *Furiæ* or *Duræ*. Mentioned by the earliest Greek poets, they play a prominent part in the writings of the tragedians. They are representatives of the mighty powers who punish those who offend against the unwritten laws of conduct. Their home is in the lower world, but their power extends into this life, and they hunt the sinner to his ruin. In the epic they punish perjury, homicide, and such sins in the household as neglect of parents and ill treatment of guests. In the tragedies there are indications of a more general conception of them as guardians of the universal laws. They either take vengeance on the living or carry off the sinner to the lower world, where others can punish him. They are also the torturers of sinners in the other world. As pursuers of criminals, they are represented in the short tunic and boots of the huntress or accompanied by hounds; as avengers, they bear whips or burning torches; while the snake of chthonic divinities appears in their hair or is carried in their hands. At first their number is not mentioned; Homer once uses the singular, and a Demeter Erinyes was worshiped at Thelpusa in Arcadia. Æschylus brought 15 on the stage in the *Eumenides*, but in Euripides the number is three, and later learning gave them the names Alecto, Megæra, Tisiphone. Their genealogy also was uncertain. Hesiod calls them daughters of Gæa; Æschylus makes them daughters of Night. Such dread deities, however, are terrible only to the sinner; to the devout worshiper they are bringers of blessing and protection, and hence are rightly called Eumenides, or at Athens *Σεμνὰί*, 'The Revered.' They were honored at Sicyon, Argos, and elsewhere, but we are best informed about Athens, where they had a sanctuary near a cave on the east side of the Areopagus, and a sacred inclosure at Colonus. Consult: Æschylus, *Eumenides*; Sophocles, *Edipus at Colonus*; Fairbanks, *A Handbook of Greek Religion* (New York, 1910).

EUMENIUS (c.260-311 A.D.). One of the Roman panegyrist (q.v.), born at Augustodunum (modern Autun) in Gallia Lugdunensis. After teaching rhetoric at Augustodunum, he went with Constantius Chlorus on several campaigns as his secretary. In 296, when Chlorus resolved to restore the famous schools of Autun, he appointed Eumenius to manage them. In 297 Eumenius delivered at Autun, in the forum, an address *Pro Restaurandis Scholis*, in which he unfolded the steps necessary to restore the efficiency of the schools. Out of 12 speeches included in Bachrens's *Panegyrici Latini* (Leipzig, 1874), 4 have been attributed to Eumenius: the speech named above; an address to Constantius Chlorus, then Cæsar, congratulating him on his victories over Allectus and Carausius in Britain (297 A.D.); a panegyric on Constantine (310); and an address on the marriage of Constantine and Fausta. Consult Teuffel, *Geschichte der römischen Literatur*, vol. iii (6th ed., Leipzig, 1913).

EUMOLPIDÆ. See EUMOLPUS.

EUMOLPUS (Lat., from Gk. *Εὐμόλπος*, *Eumolpos*, the sweet singer, from *εὖ*, *eu*, well + *μολπή*, *molpē*, song, from *μέλπω*, *melpein*, to sing). In the later mythology of Greece, the son of Poseidon and Chione, daughter of Boreas and Oreithyia. He was brought up in Ethiopia, whence

he went to Thrace, and afterward passed into Attica at the head of a body of Thracians, to assist the Eleusinians (who had once shown him hospitality) in their war against Erechtheus (q.v.), King of Athens. Eumolpus fell in the battle, and later the Eleusinians submitted to the Athenians, only reserving to themselves the celebration of the mysteries. Eumolpus also appears as King of Eleusis, and it is to him that Demeter communicates the mysteries. To him the hereditary priests of the goddess at Eleusis, the *Eumolpidae*, traced their descent. (See ELEUSINIAN MYSTERIES; ELEUSIS.) Other legends made him a musician and connected him with the mythical Thracian bard, Musæus (q.v.), as his pupil, his son, or even his father. To endeavor to harmonize the many contradictory stories about Eumolpus, some of the later mythographers distinguished three persons of this name.

EUMYCETES, ū'mi-sē'tēz. A name of convenience given to the Ascomycetes and Basidiomycetes as distinguished from the Phycomycetes. The name indicates that the first two groups are to be regarded as the true fungi, and the last named as a group of fungi with algal characters. See FUNGI.

EUNAPIUS (Lat., from Gk. *Εὐνάπιος*) (c.346-?). A Greek sophist and historian, born at Sardis. He was a Neoplatonist, a believer in the old religion, and a bitter enemy of Christianity. In his youth he was a pupil of the Neoplatonist Chrysanthius. From 362 to 366 A.D. he was a student at Athens, in the school of Proclus. In 366 he returned to his native town and there set up a school for himself. His death occurred not earlier than 414 A.D. He wrote at the beginning of the fifth century a work entitled *Lives of the Philosophers and the Sophists*, containing 23 biographies of representative Neoplatonists and Sophists; this was edited by Boissonade (Paris, 1849). This work is preserved. He was also the author of a contemporary history in 40 books, designed to be a continuation of the history of Dexippus. It included the years from 270 to 404 A.D. We have only fragments of this history; to be found in Müller, *Fragmenta Historicorum Græcorum*, vol. iv (5 vols., Paris, 1841-73), but its substance is incorporated in the work of Zosimus.

EUNICE (Lat., from Gk. *Εὐνίκη*, *Eunikē*). A Jewess of Lystra, mentioned in the New Testament (Acts xvi. 1; 2 Tim. i. 5) as the mother of Timothy. Her husband was a Greek (Acts xvi. 1), in deference to whom probably she allowed their son to remain uncircumcised (Acts xvi. 3). But she had given him a religious name (*Timotheus*, honoring God) and had faithfully trained him from early years in the Jewish Scriptures. (2 Tim. iii. 15). As she is referred to at the beginning of Paul's second missionary tour as a believer, it is likely that she was one of the converts of his first missionary work. See TIMOTHY.

EUNOMIUS (Lat., from Gk. *Εὐνόμιος*) (?-c.392). The founder of the once numerous Arian sect of Eunomians, which disappeared in the fifth century. He was born in the village of Dacora in Cappadocia and was first a lawyer, then a soldier, and ultimately took holy orders. In 360 he was appointed Bishop of Cyzicus and held his see till 364. In the great controversy regarding the nature of the Trinity which raged during the fourth century, Eunomius was conspicuous by his advocacy of the extreme Arian

view that the Father alone was eternal and supreme; that the Son was generated of Him; and the Holy Spirit, again, of the Son. His doctrine of the Trinity is sometimes called the *anomoian*, 'dissimilar,' to distinguish it, on the one hand, from the *homoiousian*, 'similar,' held by the semi-Arians, and, on the other, from the *homoousian*, 'identical,' held by the Athanasian or Trinitarian party. (See *HOMOOUSION*.) His life was much checkered. His doctrines were approved by synods at Antioch in 358 and 362, but condemned at other synods. He was banished from one place to another, until at length he obtained permission to retire to his native village, where he died about 392. His writings are preserved only as fragments here and there in the works of his adversaries. They are published in Migne, *Patrologia*, cxv, and an English translation of the first *Apology* in Whiston, *Eunomianismus Redivivus*. Consult Klose, *Geschichte und Lehre des Eunomius* (Kiel, 1833), and Harnack, *History of Dogma* (Boston, 1894-1900).

EUNUCH, ἑυνῦκ (Lat. *eunuchus*, Gk. εὐνῦχος, from εὐνή, *eunē*, bed + χῦειν, *echēin*, to have). In general, a castrated man; specifically, such a man employed as keeper of a harem or in a priestly capacity. Eunuchism is of prehistoric origin and prevails in some form or other among nearly all races and peoples.

EUNUCHUS, ἑυνῦκος (Lat., Eunuch). One of the brightest and most successful comedies of Terence, derived from the *Eunuchus* and the *Kolax* of Menander. It was produced in 161 B.C. It suggested Sir Charles Sedley's *Bellamira*, Brueys's *Le Muet*, and La Fontaine's *L'Eunuque*.

EUOMPHALUS. A fossil gastropod with wide, depressed, spiral shell. Many species are known from rocks of Silurian to Triassic age, but they are most common in those of the Carboniferous period, especially in Europe. Allied genera of importance are *Ophileta* and *Maclurea* (q.v.) of Ordovician age.

EUONYMUS. See SPINDLE TREE.

EUORNITHES (Neo-Lat. nom. pl., from Gk. εὐ, *eu*, well + ὄρνις, *ornis*, bird). A prime division of birds, embracing all except the Archæopteryx (q.v.), which is hence regarded as a representative of another and very different ancient structural type of birds, the Archæornithes. Equivalent terms are Neornithes and Eurhipidura, the latter meaning "fan-tailed" (euornithic) as opposed to the arch-ornithic Saurura, or "lizard-tailed" type.

EUPALINUS, OF MEGARA. A Greek architect, builder of a famous aqueduct on the island of Samos for Polycrates. This aqueduct, or tunnel through a hill, still exists. (See *AQUEDUCT*.) Consult the article "Emissarium," in Smith, *A Dictionary of Greek and Roman Antiquities* (3d ed., London, 1890).

EUPATORIA. A seaport and district town in the Russian Government of Taurida, situated on the west coast of the Crimea, 38 miles northwest of Simferopol (Map: Russia, D 5). Its harbor, an inlet of the Black Sea, is unprotected, but free from ice the entire year. The city is picturesque in appearance, having an Oriental character. Among its mosques the most noteworthy is that built by Devlet-Ghiri Khan in 1552, modeled after St. Sophia of Constantinople. There are a number of Tatar high schools, synagogues, Turkish baths, etc. The town has tanneries, soap and candle factories, and there is a considerable trade in grain,

wool, and salt. The salt lake of Saki, on which Eupatoria is situated, is one of the best-frequented bathing resorts in the Crimea on account of its mud springs which are credited with curative powers in cases of rheumatism and paralysis. Pop. (1910), 30,432. Eupatoria was an important place under the Tatars. With its annexation to Russia in 1783 it received its present name from an old fort constructed about 100 B.C. in the reign of Mithridates Eupator. A portion of the allied Anglo-French forces held the town for four days, Sept. 14-18, 1854. The town was also the scene of a battle between the Russians and the Turks on Feb. 17, 1855, in which the latter were victorious.

EUPATORIUM (Lat. *eupatoria*, Gk. εὐπατόριον, *eupatorion*, the plant hemp agrimony; named in honor of Mithridates Eupator). A genus of plants of the family Compositæ, having small flower heads in corymbs, with the florets all tubular. The species, about 400 in number, are mostly American, a few occurring in Europe and Asia. One only is British, the common hemp agrimony (*Eupatorium cannabinum*), a slightly aromatic perennial plant, growing mostly in marshy places and on the banks of streams. The root was formerly employed as a purgative, and the plant was also used as a diuretic and as a vulnerary. Thoroughwort, or boneset (*Eupatorium perfoliatum*), a species having the opposite leaves joined at the base, is very common in low grounds in North America and is a popular medicine often administered in intermittent fevers, also as an emetic and purgative and, in small doses, as a tonic. It contains eupatorin (a bitter glucoside), a volatile oil, tannin, etc. The whole plant is very bitter. Other North American species possess similar properties, and the root of one, known as gravel-root, or joe-pye weed (*Eupatorium purpureum*), is employed as a diuretic for the relief of the disease from which it derives its name. The ayapana (*Eupatorium triplinerve*), a half-shrubby species, native of the north of Brazil, has a high reputation in that country as a cure for snake bites and has been introduced into the East Indies. It is a very powerful sudorific and is also diuretic. The Peruvian vulnerary, matico, has been referred, but uncertainly, to a shrubby species of this genus (*Eupatorium glutinosum*). Guaco, or huaco, reputed in Peru as a cure for snake bites, is supposed to belong to the allied genus *Mikania*. For illustration, see *Plates of BONESET, GOLDENROD, and BAMBOO*.

EUPATRIDÆ (Lat., from Gk. εὐπατρίδαι, *eupatridai*, nom. pl. of εὐπατρίδης, *eupatrides*, having a noble father, from εὐ, *eu*, well + πατήρ, *pater*, father). The old aristocracy of birth in Athens, dwellers in the city itself. (See *ATHENS, History*.) At first they alone held the full citizenship, constituted the governing class, and had exclusive political rights and priestly functions, of which they were deprived by the constitution of Solon. (See *ARCHEON*; *AREOPAGUS*.) Their influence was, however, long preserved by their territorial possessions. Consult Gilbert, *The Constitutional Antiquities of Sparta and Athens* (Eng. trans., London, 1895).

EUPEN, oi'pen. A town of the Prussian Rhine Province, situated in a beautiful valley, within 2 miles of the Belgian frontier and about 10 miles south of Aix-la-Chapelle (Map: Prussia, B 3). Eupen is known for its extensive woolen and cloth mills, manufactures paper, machinery, soap, felt, and has iron foundries,

tanneries, dye works, stone quarries, and breweries. Pop., 1900, 14,294; 1905, 13,600; 1910, 13,544.

EUPHEMISM (Gk. εὐφημισμός, *euphēnismos*, from εὐφημίζειν, *euphēnizein*, to speak auspiciously, from εὐφημος, *euphēmos*, auspicious, from εὖ, *eu*, well + φῆμη, *phēmē*, voice, from φάναι, *phanai*, to speak). A figure of rhetoric by which an unpleasant or offensive matter is designated in indirect and milder terms. Thus, instead of directly calling up an unpleasant image by the word *died*, we say, "He was gathered to his fathers," and even the malicious elves and fairies of modern superstition are spoken of as "good people." See ANTIPIRASIS.

EUPHORBIA. See SPURGE; EUPHORBACEÆ.

EUPHORBIA/CEÆ (Neo-Lat. nom. pl., from Lat. *euphorbeum*, *euphorbea*, Gk. εὐφώριον, *euphorion*, the plant spurge; named in honor of Euphorbus, a celebrated Greek physician at the Mauretanian court). A very extensive family of dicotyledonous plants, the "spurge family," containing 220 genera and more than 4000 species—trees, shrubs, and herbs. They abound chiefly in warm countries and most of all in tropical America. The few species found in the colder parts of the world are all herbaceous. The common box reaches a more northern limit than any other shrubby species. The species common to the United States are different kinds of spurge (*Euphorbia*), croton, three-seeded mercury, spurge nettle, and queen's delight. The Euphorbiaceæ usually abound in an acrid and poisonous milky juice, although there are species of which the juice is bland, or becomes bland through the application of heat, so that their leaves may be used as food. The leaves exhibit great diversities. The inflorescence is also various, nearly every type of inflorescence being found. The flowers are always monosporangiate and may be monoecious or dioecious. In some species the perianth consists of one or two whorls, in others it is wholly absent; when present, it is usually five-parted. The stamens are one to many and variously united. The ovary is usually three-lobed, the carpels splitting elastically and throwing the seed to some distance. This is shown well in the drying of castor beans. Among those remarkable for the acridity of their juice are the manchineel (q.v.) and *Euphorbia agallocha*, an East Indian tree, formerly supposed to yield one of the kinds of aloes wood, the smoke from the burning of which is extremely irritating to the eyes. The juice of many of the spurges is also very acrid. Many of the Euphorbiaceæ are valued for their medicinal properties, different parts of the plant being in some instances employed, and in some the resin and oils which they contain. Many of them yield valuable products—rubber, cassava, castor oil, croton oil, euphorbia oil, candlenut, cascarilla, African teak, etc. (See HEVEA; MANIHOT.) Others, such as *Croton* and *Codiaeum*, are often cultivated in gardens and hothouses, more frequently for their curious appearance than for their beauty; but the large scarlet bracts of *Euphorbia pulcherrima*, a native of Mexico, are very attractive. See Plate of EDELWEISS.

EUPHORBBIUM. A gum resin. See GUMS.

EUPHORBUS (Lat., from Gk. Εὐφορβος). One of the bravest of the Trojan warriors, the son of Panthoüs and Phrontis. He first wounded Patroclus when the latter was fighting in the armor of Achilles and was slain by Menelaus

(*Iliad*, xvii, 1-60). Pythagoras, who held the doctrine of metempsychosis, claimed that his soul had once inhabited the body of Euphorbus; to prove this he picked out, in the temple of Hera at Argos, the shield of Euphorbus. Consult the editors on Horace, *Carmina*, 1, 28, 10-13.

EUPHORBION (Lat., from Gk. Εὐφώριον) (276-c.200 B.C.). A Greek poet and grammarian. He was born at Chalcis in Eubœa, but studied at Athens, and became librarian to Antiochus the Great about 220 B.C. His works, which included historical and grammatical productions in prose, mythological epics, elegies, and epigrams, were censured by Cicero as affectedly obscure. Among the Romans of the Augustan period, however, he was very popular, and his elegies are said to have been the models for those of Gallus and of the Emperor Tiberius. Fragments of his works are published in Meincke's *De Euphorionis Chalcidensis Vita et Scriptis* (Berlin, 1823) and *Analecta Alexandrina* (Berlin, 1843), and in Koek's *Fragmenta Comicorum Græcorum* (Leipzig, 1880). A new fragment is discussed in *Berliner Klassikerstudien*, vol. i (1907). (Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i, 5th ed., Munich, 1911.) The amours of Euphorion with Nicia, the wife of King Alexander of Eubœa, are frequently alluded to in the poems of the *Greek Anthology*.

EUPHRANOR (Lat., from Gk. Εὐφράνωρ). A sculptor and painter of Corinth, who lived in the middle of the fourth century B.C. His most celebrated painting was in the Stoa Basileios at Athens. It represented the 12 gods, Theseus with the People, and Democracy, and the charge of the Athenian cavalry at Mantinea (362 B.C.). Among his statues were an Apollo, a Paris, and a Leto, with Apollo and Artemis in her arms, fleeing from the serpent. In his statues he adopted unusually slender forms, in reaction against the solid, heavy figures portrayed by Polyclitus. Furtwängler (*Meisterwerke der griechischen Plastik*, Berlin, 1893) has proposed to identify a number of well-known statues with ancient copies of the works of Euphranor, among them the "Dionysos" from Tivoli and the Athena Giustiniani of the Vatican. Consult E. A. Gardner, *A Handbook of Greek Sculpture* (London, 1911).

EUPHRATES, â-frâ'têz (Lat., from Gk. Εὐφράτης, OPers. *Ufrâtes*, Heb. *Perâth*, Assyr. *Purattu*, Ar. *Furât*, Turk. *Frât*, from Sumerian *Pura-mun*, great water). A river of Asia, forming, with its tributary, the Tigris (q.v.), the principal river system of the southwestern part of the continent (Map: Turkey in Asia, E 4). It has its source in the heart of Armenia, in two branches—the Kara Su, or Western Euphrates, and the Murad Su, or Eastern Euphrates, the former rising 25 miles northeast of the town of Erzerum and flowing southwest to a point below Seraijik, where it is met by the Murad Su, which rises on the south slope of Ala-Dagh and flows west-southwest to the point of confluence. From Seraijik the Euphrates flows in a general southerly direction, inclining at first to the east, but later with a tendency westward towards the Mediterranean. In this part of its course it breaks through the Anti-Taurus, and flows among the mountains for 45 miles, emerging at Samsat, whence it continues uninterrupted by rapids to the sea, a distance of 1200 miles. Before reaching Rum Kaleh it

changes its direction and, flowing south, separates for some distance Mesopotamia from Syria and the deserts of Syrian Arabia. Curving to the southeast, it flows on without receiving any important tributaries for about 700 miles, until it is joined at Kurna by the Tigris. From Kurna the river takes the name of the Shat-el-Arab, and continues to flow in a southeasterly direction until, after being united by a canal with the Karun from the east, it discharges its waters through several arms into the Persian Gulf, 90 miles below Kurna. The total length of the Euphrates is over 1700 miles, while the area of its basin is estimated at 200,000 square miles.

Notwithstanding its size, the Euphrates is of little commercial importance and has very little influence on the economic life of the region through which it flows. The Armenian highlander to-day, as he did 2000 years ago, floats down the stream on his skin or wood raft to sell his goods and returns on foot to his highland home. It is navigable for light vessels from Babylon to the sea, a distance of about 450 miles, but even the portion below the confluence of the Tigris is not always of sufficient depth for navigation. Aside from the Tigris, the chief tributaries are the Khabur and Nahr Belik from the east; from the west are received the intermittent waters of a number of wadi-like streams. Originally the river emptied directly into the Persian Gulf; the accretions to the soil, due to deposits at the mouth, which, it is estimated, proceed at the rate of one mile in 50 years, have brought about the change and caused it to unite with the Tigris at Kurna.

Historically the Euphrates is second in importance to no river in the world. It flowed west of Assyria and through Babylonia and is closely connected with the early Oriental world empires. In ancient times it carried considerable commerce and travel, being navigated by means of boats of wickerwork smeared with bitumen. The plains along its lower course were intersected by an elaborate system of irrigation canals, and, fertilized by the annual overflow, which takes place from the beginning of March to the end of May, were of great productiveness and supported a teeming population. In the Bible the Euphrates is "the river," or "the great river" (cf. Gen. xv. 18; Deut. i. 7). It was one of the four rivers of Eden and the only one mentioned without description (Gen. ii. 14). In the dreams of the Hebrews concerning dominion it represented the eastern limit of their territory (cf. Deut. xi. 24; Josh. i. 4). In exile times the Hebrews became very familiar with the river, and there are many allusions to it in the prophets, particularly Jeremiah. For centuries the river was the eastern limit of the Roman power, and under the caliphs its banks were lined with prosperous towns, where the arts and literature flourished. Consult: Chesney, *The Expedition for the Survey of the Rivers Euphrates and Tigris* (London, 1850); Peters, *Nippur; or, Explorations and Adventures on the Euphrates* (New York, 1897); E. Sachan, *Am Euphrat und Tigris* (Leipzig, 1900); H. V. Geere, *By Nile and Euphrates* (New York, 1904); Hugo Winckler, *Die Euphratländer und das Mittelmeer* (Leipzig, 1905). See BABYLONIA.

EUPHRONIUS (Lat., from Gk. Εὐφρόνιος). A great Greek vase painter, who worked at Athens at the time of the Persian Wars. Ten vases signed by him are known; they well illus-

trate the progress of contemporary vase painting. Some are archaic in style and stiff, others show greater freedom from archaic tradition. The themes are varied, and the groupings striking and original. Consult Fowler and Wheeler, *A Handbook of Greek Archaeology* (New York, 1909), and P. Gardner, *The Principles of Greek Art* (ib., 1914).

EUPHROSINE, ἠ-φροσύ-νῆ (Lat., from Gk. Εὐφροσύνη, the personification of joy, from εὐφρων, *euphrōn*, joyous, from εὖ, *eu*, well + φρήν, *phrēn*, mind). One of the three Graces.

EUPHTHALMINE, ὀφθαλμίνη (from Gk. εὖ, *eu*, well + ὀφθαλμός, *ophthalmos*, eye). An artificial alkaloid. Its hydrochlorate is used in solution as a substitute for atropine and homatropine for dilating the pupil in examinations with the ophthalmoscope. Although it requires about 30 minutes to produce complete dilatation, it possesses the marked advantage that its effect passes off in five hours or less. Homatropine causes dilatation for 24 to 36 hours and atropine for several days. While effectually dilating the pupil, euphthalmine has little effect upon accommodation and can be used without danger of causing glaucoma (q.v.).

EUPHUES, ἠφ'ῶ-ἔς, or **THE ANATOMY OF WIT**. A famous romance by John Lyly (1579). It treats of the molding of English society through Italian influences and of the right principles of education. A sequel was published in 1580 under the title *Euphues and his England*.

EUPHUISM (from Gk. εὐφυνής, *euphynēs*, clever, from εὖ, *eu*, well + φυνή, *phynē*, nature, from φύνειν, *phyein*, to produce). A term used in English literature to denote an affected style of language, fashionable for a short period at the court of Queen Elizabeth. The word was formed from the title of the book which brought the style into vogue, the *Euphues* of John Lyly (1579). The style was imitated by Shakespeare in *Love's Labour's Lost*, and caricatured by Scott in *The Monastery*. See also LYLX, JOHN.

EUPHYLLOPODA. See BRANCHIOPODA.

EUPOLEMUS. A Jewish historical writer, the author of a work entitled *Concerning the Kings of Judaea*, of which excerpts made by Alexander Polyhistor have been preserved by Clement of Alexandria (*Strom.* i, 23, 153) and Eusebius (*Præparatio evangelica*, ix, 26, 30-34, 39). He spoke of Moses as the inventor of the alphabet, from whom it passed to the Phœnicians and the Greeks. He is generally supposed to have written c.158 B.C., but the passage in Clement (*Strom.* i, 21, 141) referring to him is of doubtful interpretation, and Willrich maintains that he flourished in the lifetime of Alexander Polyhistor (c.80-40 B.C.). The fragments were published by Kuhlmeier, *Eupolemi Fragmenta* (Berlin, 1840), and Müller, *Fragmenta Historicorum Græcorum*, iii, pp. 207 ff. (Leipzig, 1849). Consult also Willrich, *Juden und Griechen* (Göttingen, 1905), and Schürer, *Geschichte des jüdischen Volkes* (4th ed., Leipzig, 1909).

EUPOLIS (Lat., from Gk. Εὐπολις) (c.446-411 B.C.). An Athenian poet of the Old Comedy, ranking with Cratinus and Aristophanes. His first play was produced in 429 B.C., when he was but 17 years old. He produced in all 14, or, according to Suidas, 17 pieces, of which seven won the first prize. In the early part of his career he was on terms of close friendship and collaborated with Aristophanes, but later the relation was changed so that each accused

the other of plagiarizing from his dramas. Eupolis died apparently in 411 B.C. in a naval battle, in consequence of which misfortune it is said the Athenians thereafter exempted poets from military service. The fragments are collected in Meineke, *Fragmenta Comicorum Græcorum*, vols. i, ii (Berlin, 1839-57), and Kock, *Comicorum Atticorum Fragmenta*, vol. i (Leipzig, 1880). Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (5th ed., Munich, 1908).

EURAQUILLO, ã-rãk'wĩ-lõ (from Gk. Εὐρος, *Euros*, east wind + Lat. *Aquilo*, northeast wind, i.e., an east-northeast wind). The popular name, given doubtless by sailors, for the wind which struck the ship on which Paul was making his voyage to Rome. The ship had left the shelter of Cape Matala, on the south coast of Crete, with the purpose of making the winter harbor of Phenix (Authorized Version, Phenice), farther westward on the same island (Acts xxvii. 13, 14). In the Authorized Version, following inferior manuscript reading, it is called Euroclydon. It came evidently in a sudden change from the mild south wind under which the ship was sailing, and consisted in a violent gale descending from the mountainous heights of the island and accompanied with typhonic manifestations.

EURA'SIANS (from *Europe* + *Asia*). A term of varied application. In India it has been used for more than half a century to denote the mixed offspring of European and Hindu parents. Following the geological designation of the seeming unity of the continents of Europe and Asia as Eurasia, the word "Eurasians" came to be used in an allied ethnographic and ethnological sense. Thus, Keane (1896) finds the cradle land of the Aryans in the Eurasian steppe, and Deniker (1900) makes a Eurasian group, to include such peoples (Ugrians, Turko-Tatars, etc.) which have representatives in both continents. Sergi, in his *Mediterranean Race* (London, 1901), applies the term "Eurasian" to that variety of man which "brought with it into Europe [from Asia in the later Neolithic period] flexional languages of Aryan or Indo-European type."

EURE, ãr. A northwestern department of France (Map: France, N., F 3), formed from parts of the ancient Perche, Normandy, and the Countship of Evreux. Area, 2331 square miles. Pop., 1901, 334,781; 1911, 323,651. Its surface is level, never rising above an altitude of 700 feet, and the soil is fertile. The principal river is the Seine, which, entering the department from the southeast, flows through it in a northwesterly direction to Pont-de-l'Arche. The Eure, from which the department derives its name, and the Rille, both affluents of the Seine, are the only other important streams. The chief products are grain, hemp, flax, vegetables, and fruits, particularly apples and pears, from which large quantities of cider and perry are made; and lime, clay, stone, and marl are quarried. The breeding of cattle, sheep, and the famous Normandy horses is favored by extensive meadow and pasture lands. There are extensive iron, zinc, and copper works. Cotton goods, cloth, linen, glass, nails, musical instruments, bricks, sugar, pins, and stoneware are likewise manufactured. Capital, Evreux.

EURE. A river in the northwestern part of France, and a tributary of the Seine (Map: France, N., G 2). It rises in the Department of

Orne, flows first southeast into the centre of the Department of Eure-et-Loir, then north and northwest through the departments of Eure-et-Loir and Eure, joining the Seine above Pont-de-l'Arche, after a course of about 112 miles, for 50 of which it is navigable. On its banks is the town of Chartres.

EURE, J. C., DUPONT DE L'. See DUPONT DE L'EURE.

EURE-ET-LOIR, ãr'-ã-lwãr'. A northern department of France, formed from the ancient provinces of Orléanais and Normandy (Map: France, N., G 4). Area, 2293 square miles. Pop., 1901, 275,433; 1911, 272,255. It is watered mainly by the Eure in the north and the Loir in the south, the two rivers from which it takes its name. In the east is the fertile plain of Beauce, while the west is a country of hill and valley. The department is generally level. The soil is fertile and wheat, oats, and apples are largely produced. Manufactured products include textiles, farm implements, hats, shoes, and paper. Capital, Chartres.

EUREKA (Gk. εὕρηκα, I have found). An exclamation attributed to the philosopher Archimedes, who is said to have cried "Eureka! Eureka!" upon discovering the principle of specific gravity, whereby he was enabled to determine what proportion of silver alloy was contained in the golden crown of King Hiero of Syracuse.

EUREKA. A city and the county seat of Humboldt Co., Cal., 224 miles (direct) northwest of San Francisco, on the Northwestern Pacific Railroad, and on Humboldt Bay, connected with Pacific coast ports by regular steamship lines (Map: California, A 2). It possesses a fine harbor which has been improved by the United States government. Sequoia Park, a tract of redwood forest of 40 acres, is still practically in its virgin state. The noteworthy features are the Carnegie library, Federal building, county jail, hospital, city hall, and courthouse. An extensive trade is carried on in redwood lumber, shingles, butter, fish, apples, and wool, the exports in 1912 amounting to \$10,960,000. There are shingle mills, tobacco factories, bottling works, sash and door factories, marble and granite works, a tannery, iron foundry, woolen mill, etc. The government, under a charter of 1893, is vested in a mayor, elected biennially, and a municipal council. First settled in 1850. Eureka became the county seat and was incorporated in 1856. Pop., 1900, 7327; 1910, 11,845; 1914 (U. S. est.), 13,768; 1920, 12,923.

EUREKA. A city and the county seat of Woodford Co., Ill., 19 miles east by north of Peoria, on the Toledo, Peoria, and Western and the Atchison, Topeka, and Santa Fe railroads (Map: Illinois, F 4). Eureka College (Christian), established in 1855, is situated here. The city has a large cannery. Eureka was incorporated as a town in 1856. The water works are owned by the municipality. Pop., 1900, 1661; 1910, 1525.

EUREKA. A city and the county seat of Greenwood Co., Kans., about 90 miles (direct) south-southwest of Topeka, on Fall River, and on the Missouri Pacific and the Atchison, Topeka, and Santa Fe railroads (Map: Kansas, F 7). The Southern Kansas Academy (Congregational) is situated here, and there is a Carnegie library. Cattle raising is the chief industry. Eureka has adopted the commission form of government and owns its water works. Pop., 1900, 2091; 1910, 2333.

EUREKA. A town and the county seat of Eureka Co., Nev., about 75 miles (direct) east of Austin, on the Eureka Nevada Railroad (Map: Nevada, E 3). It was once a productive gold, silver, and lead mining camp and had smelting and refining plants. Eureka suffered severely from fires in 1878 and 1879 and from a washout in 1910. Pop., 1900, 877; 1910, 661.

EUREKA. A city in Juab Co., Utah, 90 miles south by west of Salt Lake City, on the Rio Grande Western and the San Pedro, Los Angeles, and Salt Lake railroads (Map: Utah, B 3). It is in a copper and silver mining region and has smelters and quartz mills. The city contains a Carnegie library. Pop., 1900, 3085; 1910, 3,416.

EUREKA SPRINGS. A city and one of the county seats of Carroll Co., Ark., 150 miles northwest of Little Rock, on the Missouri and North Arkansas Railroad (Map: Arkansas, B 1). It is a noted health resort, popular for its picturesque and elevated situation among the Ozark Mountains, its healthful climate, and its medicinal springs, 40 in number. In the vicinity a fine grade of onyx is found. The city contains the Crescent College for Girls, a Carnegie library, and several hotels, and has fruit-growing interests and manufactories of onyx curios. The water works are owned by the city. Pop., 1900, 3572; 1910, 3228.

EURIC. A king of the Visigoths. See **GOTHs**; **VISIGOTHs**.

EURINGER, oî'ring-ër, SEBASTIAN (1865-). A German Semitic and biblical scholar, born in Augsburg. He studied at Munich, Oxford, Heidelberg, Freiburg, Strassburg, Jerusalem (École Biblique Pratique), and Tübingen. He was ordained in 1887, preached for two years, and then traveled widely in Egypt and Palestine. In 1894-1900 he was pastor of a church near Augsburg and then became professor in the Dillingen Lyceum. Among his books, all the more valuable for his personal experiences, are: *Der Masorahst des Kohelet* (1890); *Die Auffassung des Hohenliedes bei den Aboissimern* (1900); *Die Chronologie der biblischen Urgeschichte* (1909); *Die Kunstform der althebräischen Poesie* (1912); *Ein unkanonischer Text in der armenischen Bibel* (1913).

EURIPIDES, ù-rîp'i-déz (Lat., from Gk. Εὐρύπιδης) (c.480-406 B.C.). The latest of the three great Greek tragic poets. He was born, tradition said, in Salamis on the day of the great sea fight with the Persians. His parents, Mnesarchides and Clito, were of humble station; they lived at one time in banishment in Boeotia, and on their return to Athens are said to have engaged in petty retail trade. Their son, however, had a good education. He produced his first play, *The Daughters of Peleus*, at the age of 25. From that time he devoted himself to the tragic stage. His first play won but the third place, and he gained the first prize only after 14 years of disappointment. This distinction he enjoyed but five times in all (one author, however, says he won 15 times). Euripides was of a studious and speculative nature and was a friend and disciple of Anaxagoras, Prodicus, Protagoras, Socrates, and others, although he attached himself to no particular philosophic school. He possessed a gloomy temperament, was morbidly sensitive, and apparently felt himself misunderstood by his fellow Athenians. He took no part in politics, but lived in his library. The latter part of his life he spent away from

Athens, first in Magnesia, then at the court of Archelaus at Pella in Macedonia. He died in the spring of 406 B.C. at Arethusa, near Amphipolis, and was buried not far from that city. At Athens a cenotaph was erected to him, the epitaph of which declared that all Greece was his monument, and that the earth of Macedon covered only his bones.

In sharp contrast to his two great predecessors, Aeschylus and Sophocles, Euripides represents the new moral, social, and political movements which were transforming Athens at the end of the fifth century B.C. He is also distinguished from the earlier tragedians by the fact that his interest lay in the thought and experience of the ordinary individual far more than in the sufferings of legendary beings belonging to the heroic past, so that, while he drew characters from the old mythology, he treated them in a thoroughly realistic fashion; they were no longer ideal personages far removed from everyday life, but contemporary Athenians representing every grade of society to be found in Athens at his time. In fact, Euripides shifted the tragic situation from a conflict between man and the divine laws of the universe to man's inner soul, where the struggle is between his better impulses and the evil suggestions of his baser self. He is, furthermore, the most modern of all the Greek dramatists in his tenderness and sentimentality; in some plays he appears as the precursor of the modern romantic school. In his lost *Andromeda*, of which the theme was Perseus's affection for the princess whose life he had saved, he produced the only known example among the tragedies of antiquity of a plot based on the favorite motive of the modern novel.

Euripides shared in the current skepticism of the day as to the older religious beliefs, and many passages in his tragedies betray his doubts. His attitude not unnaturally brought down upon his head the wrath of the conservatives, of whom Aristophanes was the chief literary representative. In Euripides' language the speech of common life had a considerable part, and his style shows a remarkable smoothness and dexterity; Aristophanes actually imitated it, and Aristotle praised it, so that it was the model for the writers of the later comedy. The structure of his plays, however, is often dramatically defective, as many of them are made up of brilliant detached episodes and do not form coherent units through which the plots are gradually developed. On the other hand, in other plays, as, e.g., in the *Medea*, the plot is steadily developed from beginning to end. Euripides has been blamed for his use of the explanatory prologue, in which he makes known to the spectators the events which precede the opening of the play and oftentimes outlines coming events. But he deserves censure, not for his employment of such prologues, but for the manner in which he managed them, for many of them are mechanical and 10 are burdened with long genealogies which deserve the ridicule that Aristophanes heaped upon them. He also resorts too often to the "deus ex machina" (q.v.) to solve his tragic situations, and the choral songs have frequently nothing to do with his play. Yet with all allowances for his defects, Euripides remains a great tragic poet. His greatest strength lay, as was pointed out in antiquity, in the representation of human passion and in his recognition scenes. After the beginning of the Peloponnesian War, Euripides enjoyed great popularity, and his fame was not

confined to Attica alone. In the fourth century he was read and presented almost to the exclusion of the two older poets. His writings exercised a profound influence on the Romans, especially through Ennius. The vases from southern Italy which have representations of scenes from his work attest his fame there in the fourth and third centuries B.C., and in the Roman and Byzantine periods he was highly esteemed and imitated. In modern times he has influenced English, German, and especially French dramatists.

Euripides took his plots from the same general sources as previous poets. A considerable number of plays are based on the legends of Thebes, Argos, and the stories of Heracles; the Trojan cycle had less charm for him, so that only about a fifth of his plots can be traced to that source, although 10 of the extant plays, including the *Rhesus*, which popular taste has preserved to us, belong to this cycle. The myths of his native Attica, however, had a strong attraction for him, and he took pleasure in celebrating the Athenian heroes, *Ageus*, *Theseus*, and *Erechtheus*. He also sought for subjects in new fields, especially for themes which exhibited violent passion or romantic adventures. Such were the stories of *Bellerophon*, *Cresphontes*, and *Phaëthon*, which he handled for the first time. He also treated his mythology with great freedom, sometimes varying it in different plays, or enlarging and developing a myth until it was practically his own invention.

Tradition says that he left 92 plays in all. Of these we possess but 18, and the *Rhesus*, which is almost universally regarded as spurious. The genuine plays are: *Alcestis* (438); *Andromache*; *Bacchæ*; *Hecuba*; *Helena* (412); *Electra*; *Heracleida*; *Hercules Furens*; *Supplices*; *Hippolytus* (428); *Iphigenia Aulidensis*; *Iphigenia Taurica*; *Ion*; *Cyclops* (the single satyr drama extant); *Medea* (431); *Orestes* (408); *Troades* (415); and *Phœnissæ*. Only the dates given are known with certainty; but the *Bacchæ* and the *Iphigenia Aulidensis* were produced after the poet's death. Consult *Grace H. Macurdy, The Chronology of the Extant Plays of Euripides* (Lancaster, Pa., 1905). Besides the above complete plays, over 1100 fragments of the other dramas have been preserved. Of the extant plays, the *Medea*, *Hippolytus*, *Bacchæ*, and *Iphigenia Taurica* are the best.

The best critical editions are by Kirchhoff (Berlin, 1855); Nauck (Leipzig, 1871); Prinz and Wecklein (ib., 1895-1905); a complete edition with English commentary by Paley (3 vols., London, 1858-60; vols. i and ii in 2d ed., 1872-75); Murray (Oxford, 1901-13). For the fragments, consult Nauck, *Fragmenta Tragicorum Græcorum* (2d ed., Leipzig, 1889). For recently discovered fragments, consult *Von Arnim, Supplementum Euripideum* (Bonn, 1912); *Hunt, Oxyrhynchus Papyri*, vol. ix (London, 1898-1914). Commentated editions of single plays are very numerous; only a few of the best English editions can be named here: *Alcestis*, Earle (New York, 1894); *Haley* (Boston, 1898); *Bacchæ*, Sandys (2d ed., Cambridge, 1885); *Tyrrell* (London, 1892); *Helena*, Jerram (Oxford, 1881); *Heracles*, Wilamowitz-Moellendorf (Berlin, 1889; later ed. in 2 vols.); *Heracleida*, Beck (Cambridge, 1882); *Hippolytus*, Harry (Boston, 1899); *Ion*, Verrall (Cambridge, 1890); *Iphigenia at Aulis*, England (London, 1891); *Iphigenia among the Taurians*, England (ib., 1880);

Jerram (Oxford, 1885); *Medea*, Earle (New York, 1904); *Allen-Moore* (Boston, 1901); *Verrall* (Cambridge, 1883); *Troades*, Tyrrell (London, 1897). The scholia are best edited by Schwartz (Berlin, 1887-91). There is an excellent English translation in verse by Way (London, 1894-98; rev. ed., ib., 1912); prose translation by Coleridge (ib., 1885).

Consult: Wilamowitz-Moellendorf, *Analecta Euripidea* (Berlin, 1875); Mahaffy, *Introduction to the Study of Euripides* (London, 1879); Decharme, *Euripides and the Spirit of his Dramas* (New York, 1906); Verrall, *Euripides the Rationalist* (Cambridge, 1895); Haigh, *Tragic Drama of the Greeks* (Oxford, 1896); England, *Euripides and the Attic Orators* (London, 1898); Nestle, *Euripides, der Dichter der griechischen Aufklärung* (Stuttgart, 1901); Huddleston, *Greek Tragedy in the Light of Vase Paintings* (New York, 1898); translation of various plays by Gilbert Murray (London, 1902 et seq.); Verrall, *Four Plays of Euripides* (New York, 1905); Masqueray, *Euripide et ses idées* (Paris, 1908); Murray, *Euripides and his Age* (New York, 1913); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i (5th ed., Munich, 1908); Steiger, *Euripides: Seine Dichtung und seine Persönlichkeit* (Leipzig, 1912).

EURIPUS (Lat., from Gk. Εὐρίπυλος). The narrowest part of the channel between the island of Eubœa and the mainland of Greece. Opposite Chalcis the width of the strait is but a little over 40 yards, and it is very shallow. Here a rock in the channel facilitated the construction of a bridge as early as 410 B.C. Exceedingly swift and variable currents exist in the strait. The name is sometimes used in a wider sense to designate the southeast portion of the Eubœan Channel. See **CHALCIS**.

EUROCLYDON. See **EURACILLO**.

EUROPA, or **EUROPE** (Lat., from Gk. Εὐρώπη, *Eurōpē*). In Greek legend, a daughter of Phoenix, King of Phœnicia, or of Agenor. Her beauty attracted the attention of Zeus, who appeared in the form of a white bull and carried her to Crete, where she became the mother of Minos, Rhadamanthus, and Sarpedon. Zeus presented her with the bronze man, Talos, a dog who never lost his prey, and a spear which never missed its mark, and later gave her to King Asterius of Crete, who adopted her sons. After her death she was worshiped in Crete under the surname *Hellotia*, or *Hellotis*. Modern mythologists are inclined to see in Europa a moon goddess, or else an earth goddess of fertility, like Demeter. See also **CADMUS**. Consult Escher, "Europe, i," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vi (Stuttgart, 1909).

EUROPA, THE RAPE OF. The subject of several paintings. One by Titian (1562), representing the Phœnician damsel borne through the waters on the back of Zeus, metamorphosed into a bull, and followed by three Cupids, one being seated on a dolphin's back, is now at Cobham Hall, England. The most celebrated example is by Paul Veronese in the Ducal Palace, Venice, in which Zeus in the form of a bull reclines under the trees, and Europa is assisted to his back by her attendants. Two cupids hover above with wreaths of flowers, and a third holds a cord, attached to a wreath around the bull's horns. In the background are smaller representations of the bull entering the water and of the bull swimming. Claude Lorrain's

"Rape of Europa" (Buckingham Palace) is rather a landscape than a figure painting.

EUROPE. The name is derived, according to the researches of Kiepert, Egli, and other scholars from the old Assyrian Irib or Ereb = sunset or west, which was applied to Greece to distinguish that region from Asia Minor, which was designated as Assu = sunrise or east. These names, in their later forms, were finally extended—the one from Greece over all Europe, and the other from Asia Minor over all Asia.

Europe is the smallest of the continents excepting Australia. Its area is about 3,796,000 square miles, or approximately one-fourth greater than that of the United States exclusive of Alaska. It includes, with its polar and other islands, only 7.0 per cent of the land surface of the world. It is surrounded on three sides by the sea, but its eastern frontier for about 2000 miles joins that of Asia. The political boundary in the east does not entirely conform with the natural boundary. The line is carried to the east of the central and southern Ural Mountains, the natural boundary, in order to include the rich mining districts, east of the mountains, in Russia; to the south of the Ural Mountains the Ural River is the boundary. Between the Black and Caspian seas the main ridge of the Caucasus is generally taken to be the boundary between Europe and Asia. The natural boundary in the southeast is, however, now considered by some geographers to be through the depressions of the Sea of Azov and the East and West Manitch rivers to the Caspian Sea, the entire Russian possessions south of the Manitch rivers (Ciscaucasia and Transcaucasia) being in this way included in Asia. The continent extends west and east through nearly 75° of longitude, from Cape Roca, near Lisbon, to the Tobol River. Penetrating the polar ice zone (North Cape, 71° 11' N.), its most southerly point is Cape Tarifa, Spain, which is crossed by the thirty-sixth parallel. In proportion to area it has a much longer coast line than any other continent—over 20,000 miles, including the more important indentations, but double that length if the entire shore line is closely followed. While Europe is merely a peninsula of the great land mass of Asia, the separation of Eurasia into two continents has been so long followed—a custom which originated probably in the actual separation of the densely populated regions of both by arid and semiarid expanses—it is natural to treat it as a distinct subdivision of the earth's surface.

The situation of Europe gives it a central position in the land hemisphere. It is separated from America by the comparatively narrow Atlantic Ocean. Africa is plainly in view across the Strait of Gibraltar, 9 miles wide; Europe also closely approaches Africa at the strait between Sicily and Tunis.

Topography. Three phases of the topographic aspects of Europe are particularly noteworthy: (1) the dissected, pointed, broken character of a large part of the coast line, giving it relatively a greater coastal development than any other continent possesses; (2) the predominance of low plains and the small area of high table-lands inclosed by mountains, a characteristic feature of inner Asia; (3) the absence of deserts, Europe being the only continent without desert areas.

On the Atlantic and the Mediterranean sides are a rich island world and a number of very

large peninsulas, the islands and peninsulas embracing about half as large an area as that of the continental mass. Most of the Atlantic islands rise from the continental shelf, were once a part of the continent, and are now the ruins of its former edge. The ocean far and wide around them does not exceed 700 feet in depth. These fragments, the more resistant rocks which withstood the action of waves and ice or the higher lands which were not submerged, are particularly numerous north of the fiftieth parallel. Very conspicuous islands among many hundreds are Nova Zembla, Vaigatch, and Kolguyev (on the Arctic side); Zealand and other Danish islands, Gothland, Ösel, Dagö, and Åland (in the Baltic); and most important of all, the British Isles, Shetlands, and Orkneys, composing the British group; to these may be added the distinctive polar islands, Spitzbergen, Bear Island, Jan Mayen, and Franz-Josef Land. The islands in the ocean, including the Baltic, have an area about six times as large as those of the Mediterranean, which include the Balearic group, Sardinia, Corsica, Sicily, Crete, Cyprus, and the numerous islands of the Grecian Archipelago in the Ægean Sea. Between the Scandinavian peninsula, the largest in Europe, and the Jutland peninsula the deep sea is admitted into the continental mass. Here is the Mediterranean of the north, the Baltic Sea with its three extensions, the gulfs of Bothnia, Finland, and Riga. Only one-fourth as salt as the ocean, and therefore freezing more easily, most of this inland sea is unavailable for navigation during the ice months. The many large rivers emptying into the Baltic and its narrow connection with the ocean account for its small salinity. On the other hand, the North Sea, between Great Britain and the continent, is, in fact, a part of the Atlantic and has the full effect of its tides. Brittany is a peninsular projection, which bounds the deep recess of the Bay of Biscay on the north.

In the extreme south the continent possesses three great peninsulas—the Iberian, the Italian, and the Balkan. The northern part of the Mediterranean is divided by these peninsulas into several sections: the Ægean Sea, between the Balkan Peninsula and Asia Minor, connected with the inclosed basins of the Sea of Marmora and the Black Sea by the narrow strait of the Dardanelles and the Bosphorus; the Ionian and the Adriatic seas between the Balkan Peninsula and Italy; and the Tyrrhenian Sea, in the triangular space between Italy and the three large islands of Sicily, Sardinia, and Corsica; the great bight north of Corsica is the Gulf of Genoa.

All the prominent forms of flat and steep coasts are represented on the shores of Europe. The fiord coasts of Norway and western Scotland, the deep and comparatively wide indentations of the west coasts of England and Ireland, Brittany, and northwest Spain provide a great number of excellent natural harbors, which promoted the sea trade of the Middle Ages, and have stimulated the immense development of ocean commerce in modern times. The most unfavorable harbor conditions are found along the flat, sandy coasts of the lowlands of the Netherlands and Belgium, northwest Germany, the west side of Jutland, and the French coast on the Bay of Biscay. Here, as also for the most part on the east side of Great Britain, only river mouths offer good harbors. The importance of the sea trade here depends upon flood tides and favorable conditions at the river mouths, the

largest vessels being able to navigate the rivers only at high tide. A large number of the Atlantic cities are river ports, Hull and London, Antwerp, Rotterdam, and Amsterdam, Hamburg and Bremen, Havre and Bordeaux, Oporto and Lisbon. River ports are also most numerous on the Baltic, though shipping there does not have tidal advantages. A peculiarity of the German Baltic coast is the sand dunes parallel with the shore which separate the coastal plain from the tide-washed beach.

The conditions are very different on the Mediterranean shores, where high, steep coasts are the prevalent feature, flat coasts and delta formations being exceptional. The flow and ebb of the tide are insignificant, the little rivers are unimportant for commerce, and there are no noteworthy river ports, which reappear only on the shores of the Black Sea and the Sea of Azov. Many important ports on the Mediterranean have developed without the advantages afforded by navigable rivers.

Europe owes a large part of its commercial supremacy to the remarkable development of its coast line, lengthened as it is by many islands, channels, and the deep penetration of the sea into the land.

The three most conspicuous topographic forms of the continental mass are the highland belt in the south, the secondary mountains north of it, and the lowlands. The highland belt is the western member of the great mountain zone that extends through the Old World from the upper courses of the Yang-tse and Hwang rivers to the Atlantic. This high zone is extended into Europe by the Caucasus Mountains (Elbruz, about 18,500 feet) and the mountains of the Crimea. It is then interrupted by the depressions of the Black and Aegean seas, beyond which lies the Alpine system. The Alpine system consists of a series of long and connected mountain chains of which the Alps are the heart, the highest and most prominent features. The Apennines, the Balkan Mountains, and the Carpathians, sweeping around the basin of the Danube to the Balkans, are directly connected with the Alps. The high mountains of the Pyrenees have no superficial connection with the Alps; neither (except as the return chain of the Apennine system) has the Sierra Nevada of southern Spain, which is regarded as the frontal range of the Atlas Mountains of Africa. The highland belt west of the Black Sea reaches its culmination in the Alps (Mont Blanc, 15,782 feet), which are at once the highest and most passable of all these mountains. No other high mountains of equal extent, except the Rocky Mountains in the United States, have so many passes that are easy to cross; the Alps, therefore, despite their vast snow fields and numerous glaciers, offer little or no impediment to commerce, while the Pyrenees are practically impassable except around their extreme ends.

The mountains to the north of the highland belt are of a very different character. While they include mountain ranges, they are much shorter than in the highland belt. Mountain chains, groups of mountains, isolated mountains, and plateaus are intermingled in great variety. With the exception of the Scandinavian Mountains, they are all comparatively low, and the Germans have therefore designated them as the *Mittelgebirge*, intermediate or secondary mountains. The groups of the northern mountains are the mountains of southern Poland, the

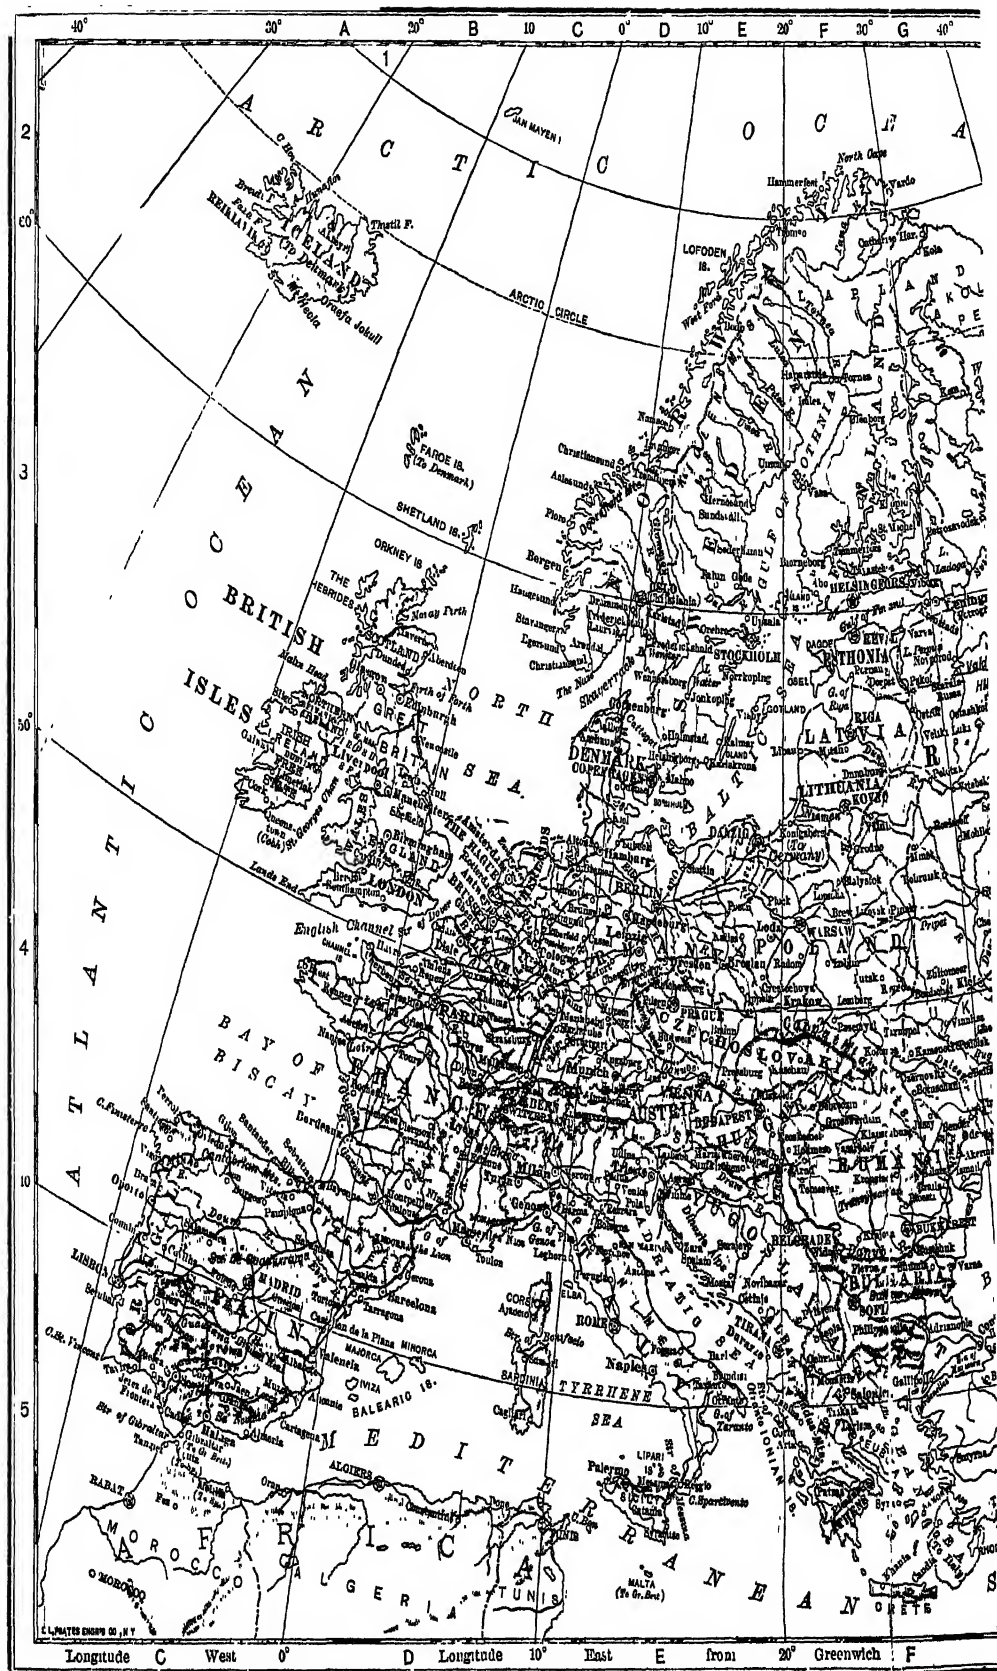

mountains of south and central Germany and France (Jura, Vosges, Bohemian Forest, Erzgebirge, Riesengebirge, Thuringian Forest, Harz, Black Forest, etc.), the British mountains, and the Scandinavian-Finnish mountains. The highest are the mountains of Scandinavia, which cover most of Norway and slope steeply to the sea, but gradually into Sweden. Far to the east and isolated from all other mountains of Europe are the Urals, the longest mountain chain of the continent, rising steeply from Asia, but sloping very gradually to the plain on the European side.

The continent of Europe has but a single active volcano within its borders—Vesuvius. Etna is on the island of Sicily. Other insular volcanoes are Stromboli, the active parts of Santorin, and Skaptar-Jökull in Iceland. Among the ancient volcanic regions may be mentioned the Alban Mountains of Italy, the Tokay District of northern Hungary, Auvergne in France, the Eifel region of Germany, and the northwest of the British Isles (with the Giant's Causeway, Fingal's Cave, etc.).

Two-thirds of the continental mass is lowland. The vast low plain of north Asia, the tundra, interrupted only by the Urals, is continued through Russia, the northern half of Germany, and through France to the Pyrenees. Smaller plains, both high and low, are also found within the mountain lands. The most important of these high plains are those of Switzerland (between the Jura and the Alps), where most of the people live, the plain being as densely populated as Germany or France; the plains of south Germany along the northern edge of the Alps; and the two high plains of Castile in Spain. The most important of the mountain-inclosed lowlands are those of the Alpine streams; the great, rich plain of the Po basin; the plains of the upper Rhine; and the four great lowlands of the Danube basin, including a large region around Vienna, the upper and lower plains of Hungary, a region of wheat and grazing, and the Wallachian plain, one of the granaries of Europe.

Generalizing these facts as to the topographic forms of the continent, it may be said that Europe is divided into two parts—the eastern part Russia, and the western part the remainder of the continent. The eastern part is an unbroken lowland, mountains rising only on its eastern and southern edges. The western part has with its plains also the two forms of mountain lands above mentioned. The eastern part is broad, massive, little articulated; or, in other words, it is not made up of connected segments. It suggests north Asia, from which it is projected. The western part is narrow, richly articulated, open everywhere to the influences of the sea. The character of the eastern part is uniformity; that of the western part, diversity.

Hydrography. The chief water parting of the continent may be shown by a line drawn from the central Urals, southwest across the Carpathians, through the secondary mountains of Germany and France to the Iberian Peninsula. All the rivers northwest of this line flow to the Arctic Ocean, the Baltic and North seas, the English Channel, or the Atlantic; all rivers southeast of the line flow to the Mediterranean, the Black, and the Caspian seas. The largest rivers are on this southeastern slope. The arrangement of the rivers of the eastern part of Europe (Russia) is simple. The Petchora, Dvina, Duna,

and Niemen flow to the northwest, and the Ural, Volga, Don, Dnieper, and Dniester to the south. The distribution of rivers in the western part is more complicated. Each of the five chief outlying members of the continent (the three southern peninsulas, Scandinavia, and the British Isles) has its own river system. In the continental mass the slopes from the mountains to the low plains north and south of them give direction to the river courses. The Vistula, the Oder, the Elbe, the Weser, the Rhine, the Seine, the Loire, and the Gironde follow the slope to the north and west; only the Rhine, of all these rivers, comes out of the Alps. Three rivers are exceptions to this rule; for the Danube, rising in the German Mittelgebirge, the Po, and the Rhône, rising in the Alps, do not flow directly away from the mountains, like the northern river, but along their edges or near them—the Danube and Po to the east and the Rhône to the west and south.

The rivers of Europe offer extraordinary advantages for commerce, although the two largest of them, the Volga and the Danube, empty into inland seas—the Volga into the Caspian, which has no outlet, and the Danube into the Black Sea; none of the great rivers is impeded by cataracts as in Africa, and their upper courses are not situated on table-lands of enormous height, unfavorable for development, as in Asia. But the rivers are so grouped that it has been possible, with the aid of comparatively short and easily dug canals connecting them, to make continuous waterways in various directions across the continental mass. Thus, freight boats ply through the land from Bordeaux to Cotte, from Havre and Rotterdam to the mouth of the Rhône, from Amsterdam to the mouth of the Danube, from Danzig and Riga to Kherson on the Dnieper and thence to the Black Sea, from St. Petersburg and Archangel to Astrakhan on the Caspian. The longest river and canal routes of Russia are those connecting the Caspian Sea and the Arctic Ocean, the Caspian and the Baltic, and the Black Sea and the Baltic. Boats loaded on the Vistula in Russia may be sent direct, by inland routes, to all the ports of north Germany, and the Netherlands, Antwerp, and Havre. The importance of the Volga and the Danube, while very great locally, is diminished by the fact that they flow towards Asia and away from the great centres of commerce. Most of the Mediterranean rivers are small and of little commercial importance; even the large Rhône is too shallow for the highest usefulness. The rivers of the Atlantic watershed, including its tributary northern seas, are those that have had a profound and far-reaching influence upon the development of the world's ocean trade.

Fresh-water lakes are particularly numerous in three regions—on the Swiss plain between the Alps and the Jura, in the British Isles, and in a wide territory bordering on the Baltic in Scandinavia and northwestern Russia. The largest are on the east and south of the Scandinavian mountains, the Ladoga and Onega of Russia being the greatest of Europe's sweet-water lakes. The largest number are in Finland. These northern lakes were formed by the ancient glaciers, which left the marks of their passage deeply graven in the surface of the land, forming many lake basins. As the Swiss region has also been extensively glaciated, the high valleys still retaining the ice streams, it is one of the important lake regions. Nearly all the larger

lakes are important in the inland systems of transportation. There are salt lakes in that part of Europe farthest from the sea, where the evaporation is greater than the precipitation or the river basins have no outlet to the sea. On the borders of European Russia and Asia is the Caspian Sea, the largest salt-water lake in the world.

Geology. Broadly speaking, Europe may be divided into three principal regions: 1. To the northeast of the Carpathians, the chief characteristic of the geological structure of Russia is the almost horizontal position of the sedimentary beds. In other words, the plications and dislocations of the rocks that mark the geology of the south and west are for the most part lacking in eastern Europe. 2. The south of Europe, including the Alpine system, is a region of great plications, relatively recent (the tertiary period), with elevated mountains. 3. The rest of Europe, from Bohemia to Spain and Scandinavia, shows ancient massifs plicated in the Archæan epoch, whose inequalities of relief have been largely modified by erosion. These primary massifs are separated by large areas of mesozoic and tertiary beds (the low plains), that in general are not plicated.

The geological structure of the mountain systems is varied and complicated. The Alps are composed of a granite nucleus with stratified beds, greatly faulted and folded, upon their flanks. The Jura is composed mainly of limestones, simply folded, with subsequent erosion. The Pyrenees, on the north boundary of Spain, are also of folded stratified rocks, as are many of the ranges traversing the plateau of the Iberian peninsula. The Apennines, one of the most recently formed ranges of Europe, is composed largely of Tertiary beds, much folded, the folds being arranged on *déclivon*. In the south the Carpathians and Balkans are composed of a central nucleus of metamorphic schists, with stratified limestones upon their flanks. The Ural Mountains are of crystalline rocks. The mountains of the Scandinavian peninsula are of great age, being in large part Archæan with granites and schists, while down the slope towards the Baltic more recent formations successively appear, and in the southeast Triassic, Jurassic, and Cretaceous rocks are found. The great plain of Europe is floored by Cretaceous and Tertiary beds, except in Finland, where Archæan rocks, stretching across from the Scandinavian peninsula, cover the land. The mountainous portions of the British Isles are chiefly composed of granites and schists, while the lowlands are floored in great part with Jurassic beds. The northern half of Europe was in recent geologic time covered by a great ice sheet, which in its retreat has covered the land with glacial deposits, besides having by its erosion greatly modified the surface, changing the courses of the streams and scouring out lake basins. The soils of this portion of Europe are in great part composed of glacial silt and detritus, transported by this great sheet of ice.

Carboniferous coal deposits have been found in many parts of Europe between the parallels 40° and 60° N.; in eastern, southern, and west central Russia, Austria-Hungary, Germany, Belgium, France, Spain, Scotland, England, and Wales. Those of England and Wales are of special value and importance; the proximity of the English coal mines to the sea and the leading coal-buying countries make England the

regions. See ARCTIC REGION, section *Arctic Plants*.

The intermediate temperate region, which extends from the southern fringe of the Arctic region to the northern limit of the Mediterranean-Caucasian, is characterized first by more varied and numerous perennials which, as the northern limit recedes, become taller, and among which are both shrubs and trees also increasing in size and height; and second, by annual species which also increase in number and variety southward. These species, of which many appear to have migrated westward from Asia, and which are very prolific of seed, quickly take possession of abandoned land, and, being of fairly rapid growth, readily adapt themselves to wide differences of climate, withstanding on the one side the rigors of high latitudes and elevations and on the other the droughts of arid sections. In the western part forests are the dominant feature; in the eastern, steppes. Throughout the whole forest sections of this region cone-bearing trees predominate. In the far north they exclude all other species of trees, but as the latitude of central Norway is approached, ash, birch, and alder appear. The forest of southern Norway, the Baltic provinces of Russia, and especially of Denmark, though still largely coniferous, are liberally sprinkled with oak and beech and the three deciduous species mentioned. Throughout Germany and adjoining Russia, France, and Austria, the leading trees are still the conifers (pine, larch, fir), among which the others mentioned are found, mingled with which are elm, maple, acacia, and poplar.

The steppes, not unlike the great plains of North America, are treeless plains that extend across Russia. These steppes blend with the tundras of the Arctic region, and on the south with the more northerly forests of the Black and the Caspian Sea districts. Since their climate—long severe winter, short vernal season, and protracted parching summer—largely precludes the growth of perennials except along the river basins, which are often wooded, their flora consists of annuals—grasses on the arable soils, especially north of the Black Sea forests, salt-loving plants in the saline sections north of the Caspian Sea. In the northern part of both forest and steppe districts Arctic species mingle with the harder temperate plants, in addition to which mustards, parsleys, buttercups, thistles, legumes, crowberries, brambles, bilberries, and their allies are met with in increasing frequency southward. In the southern part these last-mentioned blend with gorse, shrubby legumes, heaths, lobelias, dianthus, etc., which are most numerous towards the west, while mints, angelica, currants, rhubarb, and their congeners are more abundant towards the east. In addition this region embraces the great agricultural sections of Europe—the vast grain, flax, and grazing areas of Russia; the cereal, root, and hay fields of Germany, Norway, and Sweden; and the general farming sections of Germany, Denmark, Holland, Belgium, the British Isles, and northern France. Except on the remote north border, grasses and legumes, the bases of successful husbandry, thrive remarkably and materially influence the prosperity of the residents.

The Mediterranean-Caucasian—the fruit, flower, and vegetable—region, which extends from the Atlantic Ocean to the Caspian Sea, thus includ-

ing all countries on the warm southern border of the continent, is noted for the great diversity and wide economic importance of its flora, which, it is estimated, comprises 85 per cent of all European species. Annuals and biennials appear in large numbers, the long season of growth favoring their perfect development. The forests are far more mixed than in the other two regions, and contain in addition to the above-mentioned species, which appear at greater or less altitudes, evergreen and cork oak, chestnut, sycamore, mountain ash, plane, and cypress. The tendency in this region is for forests to give place to clumps of trees, and these, in turn, to scantier vegetation. Of the plants valued for their flowers may be found numerous relatives of the rose, carnation, hibiscus, lilac, tuberoses, crocus, lily, colchicum, iris, and many others. In this region more than in either of the others the flora is augmented by exotic species, especially such as have been introduced by man. With the migration of the human race and the extension of commerce westward, useful plants have been purposely carried, and useless ones undesignedly transported, to regions far distant from their homes. Of such antiquity are many of the Asiatic and African contributions to this flora that many species have become so settled in their new residences as to be considered indigenous. Of these, perhaps the best known are the fig, peach, apricot, walnut, orange, olive, pomegranate, grape, quince, cherry, mulberry, pistachio, melon, leek, onion, sugar cane, cumin, and cotton. But south Europe has been not merely a greedy absorber of introduced species; it is a lavish distributor as well. Its trees, fruits, vegetables, and flowers have been carried to every quarter of the globe that European commerce has reached. Save only the plants of Norway's west coast, few in number, but of great adaptability to foreign climates, the species of no other region compare with those of south Europe as wanderers. So general has been their distribution that no traveler in any country visited by civilized man can go far without meeting plant acquaintances; if not among the useful species, then among the weeds of this Mediterranean-Caucasian region. See paragraphs on flora of the various countries; also DISTRIBUTION OF PLANTS.

Fauna. The whole of Europe belongs to the Palearctic region of Wallace, but is divided into two subregions—that of north Europe north of the Pyrenees, Alps, and Balkans, and that of the Mediterranean south of these mountains. The richness of the fauna of central and north Europe is due to the favorable climatic influences in the west and centre, the topographic variation, and the rich vegetation, especially that of the forests. On the other hand, the great density of population has much reduced the numbers of the larger animals and has even rendered some species extinct. The characteristic mammals are the bear, lynx, badger, wolf, fox, otter, marten, ermine, polecat, squirrel, marmot, mole, hedgehog, vole, shrew, dormouse, hare, and rabbit; the wild cattle have been almost wholly exterminated by man. (See CATTLE.) Among the species peculiar to this region are the desman and the chamois. The Mediterranean subregion possesses the richest fauna of the European Palearctic region, among the distinctive mammals being the fallow deer, ibex, Alpine marmot, and civet. This fauna extends also along the south shore of the Mediterranean as

far as the Atlas Mountains; and this northwest corner of Africa and the Aegean Islands contain a few species, like the wild sheep, not now known in Europe, but properly a part of its fauna.

The apes are not found in Europe save for a species of macaque in the neighborhood of Gibraltar, which is more nearly allied to the Asiatic simians than to the African. Bats, cats, dogs, martens, deer, hares, and mice are found throughout Europe. Hedgehogs are not found north of lat. 60° except in Scandinavia, where they range a few degrees farther north. Moles are found between lat. 44° and 60° N., and also range a little farther north in Scandinavia. Otters and badger-like animals are found little above the Arctic Circle. Bears are not found in the extreme west, though formerly inhabiting nearly the whole of France and the British Isles. Dormice are found in western Europe as far north as the 60th parallel, but in eastern Europe not above lat. 50°. Squirrels are found throughout Europe except at the extreme north, and beavers south of lat. 65°, but not in the extreme west and not below south of the Alpine region. Swine are found south of 60°.

Of the birds, the most characteristic are the thrushes, sylvine warblers, tits, pipits, wagtails, finches, snow buntings, house sparrows, crossbills, linnets, magpies, choughs, kingfishers, goat-suckers, wood pigeons, grouse, and ptarmigans. Of the larger birds may be mentioned the eagles, falcons, owls, and ravens. Many of the numerous birds found in this region are annual migrants from the south.

Reptiles are comparatively scarce, there being found but 14 species of snakes and 12 of lizards. Only one north European serpent is venomous. Of the amphibians, several forms are peculiar to this region, among which are the eel-like proteus, the curious toad (*Alytes*), the male of which carries the eggs until they are hatched, and the *Pelodytes*, a frog peculiar to France. Frogs, toads, tree toads, and newts are common.

The characteristic fresh-water fish are the sticklebacks, perch, sheatfish, pike, carp, gudgeon, roach, chub, dace, tench, bream, bleak, loach; and among sea fish several species not known on the American shores of the Atlantic, of which the tunny and sole are most conspicuous.

Insects are numerous, butterflies especially being very abundant, and the species widely spread, but no genera are peculiar to the region. This region is also rich in beetles and other insect forms.

HISTORY

Earliest Population. Of the peoples that have inhabited Europe since the dawn of history, some—and these the most important, Greeks, Italians, Celts, Germans, and Slavs—exhibit striking resemblances in language and in their early religion and customs. Other peoples, like the Iberians, who inhabited what is now Spain, the Etruscans, who inhabited north Italy, and the Lapps and Finns, who still occupy the extreme north of the continent, apparently had from the outset dissimilar speech and customs. The resemblances noted between the peoples of the first group exist also between them and the Indo-Iranian peoples of Asia. From these data philologists have inferred that all these peoples are members of a single race, which they term

the Aryan race; and since, in historical times, the Celts, Germans, and Slavs have been pressing westward, it is assumed that the original home of the Aryan race was in Asia. Modern ethnological researches, however, are tending to modify the Aryan hypothesis. On the basis of a comparison of physical characteristics, especially of skull forms, it is asserted that the original population of Europe consisted of two races, which are termed Eurafrian and Eurasian, and that the former race was originally located in the basin of the Mediterranean, the latter in the valley of the Danube or even farther east. Of the Eurafrian race two branches are found, one of which continued to live on the Mediterranean, while the other went or was driven into north Europe (the so-called Baltic branch). It is further asserted that the so-called Aryan peoples of Europe exhibit, for the most part, such a mixture of these two racial types that the resemblances which have heretofore been taken as proofs of common origin seem rather ascribable to the diffusion of the speech, religion, and customs of some superior people, partly by expansion and conquest, partly by imitation. See ARYAN; INDO-EUROPEANS; EUROPE, PEOPLES OF; MAN, ANCIENT TYPES.

Earliest Civilization. In the earliest times of which we have historic knowledge, only those parts of Europe which border upon the Mediterranean were in any sense civilized, and the points at which a Mediterranean civilization first appeared were Egypt and Phœnicia. There is increasing evidence that the civilization of these countries was of Asiatic origin. It probably came along the routes of trade from Assyria (perhaps ultimately from China), and its diffusion through the Mediterranean basin was accomplished chiefly by the earliest traders in that sea, the Phœnicians. It was in Crete, where the Phœnicians had some of their earliest trading posts, that a Greek civilization seems first to have developed. See ASSYRIA; EGYPT; PHœNICIA.

Greek Civilization. Before the conquest of Greece by the Romans (146 B.C.), the Greeks had developed every form of government which Europe has since known. Their little city states passed from patriarchal kingship to aristocracy and from aristocracy through tyranny to democracy. In the struggle of their leading states for predominance, as on the larger theatre of Europe 2000 years later, a refined diplomacy, solicitous to maintain the balance of power, knit and dissolved alliances; and when, weakened by these internal conflicts, Greece was subjected to the military monarchy of Macedonia, an era of imperialistic expansion began. In art and in letters this precocious people similarly anticipated every form of expression which European civilization has since employed; and Greek builders, sculptors, poets, and orators produced masterpieces that have not been surpassed. In philosophy also the Greeks have foreshadowed, if they did not anticipate, all the chief tendencies of modern thought. By colonization the Greek civilization was extended to Asia Minor, Sicily, south Italy (*Magna Græcia*), and many other points in the Mediterranean. By the conquests of Alexander the Great (q.v.) it became dominant in Egypt and southwest Asia. As far as Europe was concerned, the only lands which the Greeks brought into closer touch with Mediterranean civilization were those bordering on the Black Sea. In that sea the Phœnicians had had

trading posts, but the Greeks founded colonies and built cities. A trade route was gradually established between the Black Sea and the Baltic, and the direct influence of the Greek civilization upon eastern Europe did not cease until Constantinople was captured by the Turks (1453 A.D.). See *ARCHAEOLOGY*, subdivisions I-V; *GREECE*; *GREEK ART*; *GREEK LANGUAGE*; *GREEK LITERATURE*; *GREEK PHILOSOPHY*.

Roman Civilization. Inferior to the Greeks in alertness of mind and in versatility, but superior in poise and in judgment, the Romans slowly developed a civilization of a higher type in matters of government and law. They first devised a working combination of power and freedom. In the third century B.C. Rome had made herself mistress of Italy; when, in the struggle with Carthage (q.v.), she added sea power to her land power, she was able to extend her authority over the entire basin of the Mediterranean. After the conquest of Greece (146 B.C.) the Greek culture became dominant at Rome in art, letters, and philosophy; and the civilization which the Roman Empire carried into lands heretofore barbarous was a Græco-Roman civilization. In the eastern portion of the Empire, the direct influence of Greece was naturally greater; in the western portion, that of Rome. In west and central Europe the Greek culture was introduced and perpetuated, until the fourteenth century, mainly through the Latin imitations and adaptations of Greek forms and Latin popularizations of Greek thought, and the original Latin productions, that sprung out of a study of Greek culture. The third great force that has shaped modern Europe, Christianity, was sensibly affected by Greek thought and Roman institutions. Paul and the early fathers, trained in the learning of the Greeks, put the doctrines of the new religion into the form best adapted to appeal to the Græco-Roman world; the formulation of its dogmas was sensibly influenced by Roman legal ideas; and the hierarchic organization with which the Christian Church came into medieval Europe was modeled on the administrative system of the Roman Empire. If it is broadly true, as Maine has said, that the modern civilized nations are those that derive their law from Rome, their art from Greece, and their religion from Judæa, it is also true, as Freeman has said, that "of all European history Rome is the centre"; for the Roman Empire summed up the chief results of the ancient civilization and transmitted them to the modern world. See *ROME*; *CHRISTIANITY*; *CIVIL LAW*.

Europe Under the Roman Empire. Under Augustus the Roman Empire attained the boundaries which it successfully defended for four centuries. (See *Map of the Roman Empire, under ROME*.) In Europe these were the Rhine and the Danube, and the territory between the upper courses of these rivers. In only two directions was there subsequent expansion. During the first century the greater part of Britain was subdued (see *BRITANNIA*); and at the beginning of the second century the territory beyond the lower Danube, Dacia (modern Rumania), was organized as a province and held for 170 years. (See *TRAJAN*.) Military roads and fortified camps not only facilitated the defense of the Empire, but stimulated trade and the growth of cities. Except in the most mountainous regions, the barbarians whom Rome had subjugated gradually accepted the Græco-Roman

civilization. In Spain and Gaul and in the British cities Latin supplanted the native languages. From the close of the first century the provinces supplied the Empire with the majority of its civil and military officers and with nearly all its emperors. Through this increasingly homogeneous Empire the Christian religion made rapid progress; and when in the fourth century Christianity became the state religion, the provincials accepted that creed which had finally obtained the recognition of the Imperial court—the creed formulated by Athanasius (q.v.). Of the barbarians beyond the Roman borders, the nearest and most dangerous were the Germans. The almost incessant conflicts which were necessary to hold the line of the Rhine and the Danube forced Rome steadily further into military monarchy, until, under Diocletian (q.v.), the Empire was reorganized on lines which contemporaries regarded as "Persian." The burden of a great standing army, bad management of the Imperial finances, and an elaborate system of state socialism impoverished the Empire, and its native population diminished. In order that the soil might be tilled and the legions kept at full strength, barbarians, especially Germans, were imported in increasing numbers. At the time of Augustus the population along the west bank of the Rhine was substantially German. In the following centuries German captives were settled in Britain, in Gaul, in Italy, and in the Danubian provinces, at first as serfs, but after the close of the third century as tributary communities. From these and from tribes across the frontier in alliance with Rome, an increasing proportion of recruits was drawn, until in the fourth century the legions settled on the frontier were largely composed of Germans. After Constantine Germans rose to the highest positions in the army and the central administration, and "the last century of Roman history may boldly be characterized as the century of German rule." (Brunner.) Upon the Germans beyond the frontier the most important effect of these centuries of conflict was the gradual formation of those larger tribal unions which in the fifth century overthrew the West-Roman Empire and divided among them its provinces. The tribes in closest contact with Rome were converted to Christianity in the fourth and fifth centuries. The missionaries who accomplished this work were followers of Arius (q.v.), and the Germans retained the Arian creed after the emperors and the church councils had accepted that of Athanasius. See *GERMANIA*; *GOTHS*; *HUNS*; *ROME, The Roman Empire*.

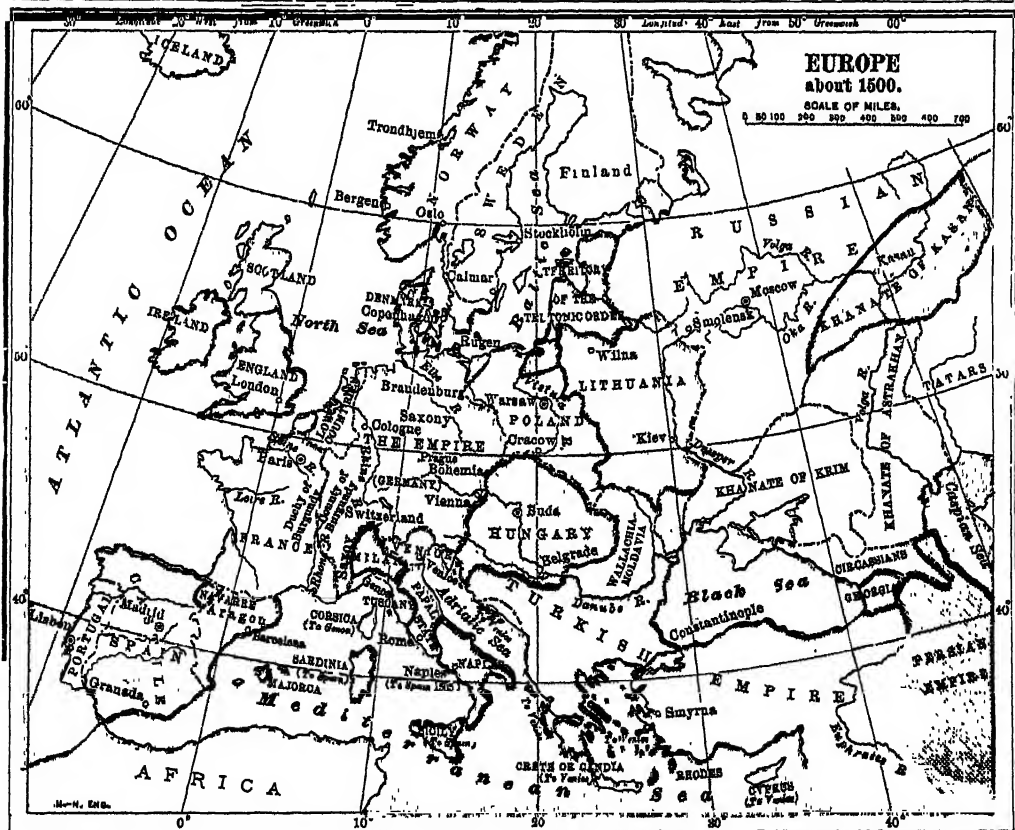

The Barbarian Kingdoms. It was the beginning of the end of the old order when, at the close of the fourth century and the beginning of the fifth, whole German tribes were settled within the frontier as allies of Rome, on the condition that they should hold back the tribes behind them. The incursions of the Huns (q.v.), which threw eastern and central Europe into confusion, hastened the destruction of the Empire. In the fifth century the frontier was lost; the Germans and the Huns broke through all along the line. (See *MIGRATION*.) At the close of the fifth century Saxons, Angles, and Jutes had established kingdoms in eastern and southern Britain; Gaul was divided between Franks, Burgundians, and Visigoths; Spain between Visigoths and Suevi; northern Africa and the islands of the western Mediterranean were occu-

pied by Vandals; and Italy, where a German leader of mercenaries (see ODOACER) had deposed the last West-Roman Emperor, had passed, with all the territory between the middle Danube and the Adriatic, under the rule of the Ostrogoths. (See BURGUNDY; GOTHs; SUEVI; VANDALS; ETC.) To the Roman provincials (except in Britain) the change of conditions must have seemed slight. They had often been ruled by German officials, and the German kings who now ruled them held official titles conferred by the Emperor at Rome or the Emperor at Constantinople. The Romans remained free, and in their disputes with each other they were still governed by Roman law. The Burgundian and Visigothic kings caused manuals of Roman law to be compiled for the benefit of their Roman subjects. Theodoric (q.v.), King of the Ostrogoths, issued a similar compilation, by which (Goths as well as Romans were to be governed. Each provincial landholder was, indeed, compelled to surrender to a German a part of his estate and slaves; but under the Empire German soldiers had been quartered on the provincials, and contributions had been exacted for the support of the soldiers. From such contributions the Romans were now freed. The chief cause of friction between the German kings and their followers on the one hand and the Roman provincials on the other lay in the fact that the former were generally Arian heretics. The resultant disaffection was a serious element of weakness in the kingdom of the Goths, Burgundians, and Vandals. Early in the sixth century the newly converted and orthodox Franks defeated the Visigoths and the Burgundians and brought under their control all Gaul except the Mediterranean coast. (See CLOVIS; FRANKS.) Later in the same century the armies and fleets of the orthodox Justinian overthrew the kingdoms of the Arian Vandals and Ostrogoths and wrested southeastern Spain from the Visigoths, so that for a few years the Mediterranean was again Roman. (See JUSTINIAN; BELISARIUS; NARSES.) Before the close of the century the Visigoths and the Suevi, whose realm the Visigoths had annexed, abjured their heresies, and in Visigothic Spain the clergy became all-powerful. In 568 the Arian Longobards, or Lombards (q.v.), conquered north and central Italy; but this tribe also accepted the orthodox faith in the middle of the seventh century. The scattered settlement of the German conquerors among their Roman subjects favored a fusion of races, and the chief obstacle to fusion disappeared when the Germans became orthodox Christians. Of all the kingdoms founded by the Germans on Roman soil, that of the Franks became the most powerful and proved the most durable, because the Franks retained, as the central point of their power, their old home on the lower Rhine, and because the expansion of their rule over Gaul and later over Italy was accompanied by expansion over purely German territory. At the close of the fifth century the Franks conquered the Alemanni and in the sixth the Thuringians and the Bavarians.

The Arabs. In the seventh century Christendom was forced into a struggle for existence against the hordes of Arabia, fused into a fighting unit by a new religion,—Mohammedanism. Within a generation after the Hejira (622 A.D.) the Arabs had destroyed the Kingdom of the Sassanides in Persia, had wrested from the Greek Empire Syria, Armenia, Cyprus, Crete, and

Egypt. Before the close of the century they were overrunning north Africa. A few years later they were besieging Constantinople. The Greeks, though hard pressed by Asiatic hordes north of the Balkans, nevertheless beat off the Mohammedan attack and maintained a hold on Asia Minor. Early in the eighth century the Arabs, now in complete control of north Africa, defeated the Visigothic forces (711 A.D.) and conquered all Spain except the mountainous northern regions. Pressing into Gaul, they were defeated by the Franks in 732.

The Frankish Empire and the Papacy. The German-Gallic Kingdom which the Franks had built up in the fifth and sixth centuries was threatened in the seventh century with dissolution. The royal power was hereditary, but all the sons of the king had equal rights of inheritance. The resulting partitions were indeed temporary; by wars and by deaths the realm was repeatedly reunited; but in these struggles the territorial magnates gained increasing independence, while the degeneracy of the reigning house diminished its authority. (See MEROVINGIANS.) The power that was slipping from the hands of the Merovingians was, however, grasped by new rulers, Arnulfings or Carolingians (q.v.), who, first as mayors of the palace, later as kings, reestablished the royal power, and in the eighth century widened the Frankish kingdom into an empire. As in the earlier stages of Frankish expansion, the acquisition of new Romanic territory (part of Italy and northeastern Spain) was balanced by conquests of other German tribes (Frisians and Saxons). Even more than the Merovingians, the Carolingians identified their dynastic interests with those of the orthodox Christian Church. They carried the gospel among the heathen Germans with the sword, converting as they conquered. They drove the Arabs back across the Pyrenees (see CHARLES MARTEL and PEPIN THE SHORT under PEPIN) and extended the boundary of Christendom to the river Ebro. Throughout their realms they supported with ready assistance the supreme authority of the Pope in ecclesiastical discipline; and when they interfered to protect him against the Lombards they gave to him a strip of central Italy, reaching from Ravenna to Rome, and thus laid the basis of the temporal power which the popes held until 1870. (See DONATION OF PEPIN; PAPAL STATES.) The sovereignty of the Emperor at Constantinople, which the Roman pontiffs had previously recognized, was from this time denied. (See PAPACY.) In return for their services to the church, the Carolingians received aid from the popes in political matters. The papacy helped to transform Pepin from mayor of the palace into King (751 A.D.), and Charles the Great from King of the Franks and the Lombards into Emperor of the Romans (800 A.D.). The tradition of the Roman Empire, the idea that all Christians should be subject to one secular lord, the Emperor, was still a force; and when Charlemagne had made himself supreme in the Western Christian world, and the Imperial dignity had passed at Constantinople to a woman (Irene), it seemed to Western Christendom a natural thing that its ruler should be recognized as the successor of the Roman Cæsars. Through the harmonious coöperation of church and state, in the Empire of Charlemagne, the political, religious, and literary influences that had come down from the

ancient world were for the last time focused; and from the Frankish Empire these influences were transmitted, with certain permanent modifications, to the new and separate nations which took its place. Of the new institutions that took shape in the Frankish Empire the most important was feudalism. Feudalism had many roots, some of them Roman; but the growing feudal institutions received a great impetus when Charles Martel, in order to meet the Arab horse with Christian cavalry, gave benefices on the tenure of knight service. The knight fees which he created were to a large extent carved out of church lands; and the church was drawn into the feudal system. See CHARLES THE GREAT; FEUDALISM.

Europe at the Time of Charlemagne. (See Map: EUROPE AT THE TIME OF CHARLEMAGNE.) The Empire of Charles the Great included all Christian Europe except the British Islands, where the German invaders had been converted in the seventh century; northwest Spain, where Christian chieftains of Gothic or Suevic blood were holding out against the Arabs; and the Greek Empire. The Danes and Scandinavians on the north, the Slavs and Avars on the east, were still heathens. The Frankish Empire included all the German tribes of central Europe; but it did not include all the territory of modern Germany, since its northeastern frontier ran between the Elbe and the Oder. The other important European powers were the Greek Empire and the Emirate of Cordova. The territory north of the Balkans had fallen into the hands of Slavic and Asiatic hordes (Servians and Bulgarians); but the Emperor at Constantinople still ruled the rest of the Balkan Peninsula, together with south Italy, some of the islands of the Mediterranean, and the greater part of Asia Minor. The Greeks still had sea power, and the trade between Europe and the Orient was mainly in their hands. Until after the Crusades their coin, the "besant," was the standard of Mediterranean values. South of Christendom, from Spain through north Africa to Syria, curved the crescent of Islam. In the west, where the emirs of Cordova had made themselves independent of the caliphs at Bagdad, Mohammedanism had reached the limit of its forward movement; but in the islands of the Mediterranean, in Asia Minor, and in southeast Europe it was still to win ground from the Greeks. Placed in touch with the Greek civilization in Syria and in Egypt, Islam was developing, in letters and in science, a culture which, until nearly the close of the Middle Ages, was superior to that of western Europe. See SARACENS.

Dissolution of the Frankish Empire. Beginnings of the Modern European Nations. The power of Charles the Great's successors was undermined by the growing independence of the local magnates, particularly of those who held the offices of count or of margrave. These offices, as well as the domains that went with them, were coming to be regarded as fiefs and, like other fiefs, were becoming hereditary. Some magnates whose feudal authority extended over several counties were coming to be called dukes. In the German territories some of these dukes ruled over tribes, like the Bavarians and the Saxons, and were in a sense successors of the tribal kings whom the Franks had suppressed. The great prelates, too, were becoming independent, and in many cases bishops and abbots received the secular powers of counts.

The Empire was weakened also by the attacks of Slavs and other barbarians on its eastern frontier, of Arabs in Italy, and of Scandinavian pirates on all its northern and western coasts. The immediate cause, however, of the disruption of the Empire was the division of the Imperial territory among all the sons of the Emperor. In order to maintain as far as possible the unity of the Empire, a compromise was proposed: Arrangements were made by which each son should receive as King a part of the Empire, but a larger part with a superior authority should go to the eldest son as Emperor. Wars followed, and in these the old Frankish principle triumphed. In 843 the Empire was divided into three shares. (See VERDUN, TREATY OF.) Although this division lasted but 27 years, the name of a part of the middle kingdom, Lotharinga, still survives in the modern Lorraine. Some 40 years after the partition of Verdun, all the Carolingian territories were for a short time reunited under Charles the Fat; but after 887, when Charles the Fat was deposed, France and Germany were permanently separated; there were two independent Burgundian kingdoms, and Italy was separate, but not united. In the north of Italy there were kings, some of whom were crowned emperors; in the middle were the possessions of the papacy; in the south Lombards, Greeks, and Arabs were fighting for control and territories. In France and in Germany descendants of Charles the Great reigned for a time; but in the tenth century other kings, not of the Carolingian stock, were set up by the territorial magnates. Of these new kingdoms Germany was by far the strongest. The Northmen pirates were beaten off from its coasts, and the Danes were pushed back into Jutland. The Hungarians, who had kept central Europe in turmoil during the first half of the tenth century, were defeated and confined to approximately the territory which they still occupy. The Slavic Kingdom of Poland recognized German suzerainty; the Slavic peoples of Bohemia and Carinthia were incorporated into Germany. The debatable land to the west of the Rhine (Lorraine) and the greater part of Italy were brought under the overlordship of the German kings in the tenth century; Burgundy was annexed in the eleventh. With the reestablishment of German authority in Italy (962) the German kings assumed the Imperial title. See HOLY ROMAN EMPIRE.

Second only to Germany's influence during these centuries was that of the Scandinavians. In the latter half of the ninth century the Swede Rurik established among the eastern Slavs the kingdom which became Russia, and the Danes conquered half of England. In the tenth century the Norsemen obtained possession of a part of north France, founding there the Duchy of Normandy. In the first half of the eleventh century the Danish King Canute reigned for a few years over an empire which included all England and the greater part of Scandinavia; and England escaped from the rule of the Danes only to fall, within a score of years, under that of the Normans. In the same century Norman knights gained control of south Italy and Sicily. (See NORMANS; VARANGIANS; GUISEARD.) Of all the national states that were in process of formation at the close of the eleventh century, England alone had a strong central government, and this only after the Norman Conquest. France and Germany each had a king, but the

king was only the first among his peers; the real power was, in France always, in Germany sometimes, in the hands of the great nobles and prelates. The same was true in Italy and in the Christian states that were taking form in north Spain; and in neither of these peninsulas was there even the nominal unity of a single national kingship. In Spain and in Italy, however, as in France, separate and fairly homogeneous nationalities were developing. Goths and Franks, Burgundians and Lombards, had intermarried with the Roman provincials and had adopted their speech; and on the basis of the vulgar Latin of each province, new national languages had already been formed. The Scandinavian conquerors also, who came five centuries later, lost their racial identity and became French in France, Italians in Italy, Russians in Russia. In all the larger countries of west and south Europe, however, there were marked local differences in dialect and in customs, and broader differences between the northern and southern districts. In general, throughout the Middle Ages, national feeling was weak. The strongest ties were those of locality and of class, and the classes were not national, but European. At the close of the eleventh century the peoples of north and east Europe were coming under the influence of Christian civilization. The only important regions not already reclaimed from heathenism at the end of the century were those south and east of the Baltic, inhabited by Pomeranians, Prussians, Lithuanians, Livonians, etc. The Scandinavians, the western Slavs (Poles and Bohemians), and the Hungarians received Christianity from the Roman church, and were thus drawn into the West-European body of nations. The Servians, Bulgarians, and Russians, on the other hand, were converted by Greek missionaries and constitute to this day, with the Greeks, a distinct East-European group.

Increasing Power of the Church. After the disruption of the Frankish Empire the unity of Western Christendom was visibly represented only in the Roman church. The church had supported the Carolingian Empire and had striven to avert its destruction. When this became inevitable, the church naturally secured as much as possible of the Imperial inheritance. The unity for which it stood was in no wise confined to matters of faith and worship. The church represented the learning of the age and had complete control of education. It was the recipient and administrator of charitable trusts; it cared for the sick and infirm and relieved the poor. It interpreted and enforced by penalties rules of morality, and by reason of the intimate connection between morals and law, and between its sacraments and the whole social life, it exercised a somewhat indefinite but very wide jurisdiction over matters which are to-day regarded as legal. (See CANON LAW.) To this jurisdiction every Christian was thought to be subject, from the peasant to the king. The church thus discharged many governmental functions which the mediæval state was too crude and too feeble to undertake. It was in reality an ecclesiastical state, and it possessed a governmental organization and a governmental *personnel* far superior to that of any contemporary secular state. For the efficient discharge of its duties the church deemed it necessary that its agents, from pope to parish priest, should be independent of the secular powers. It had par-

tially succeeded in exempting its clergy from secular jurisdiction, but it had not obtained full freedom in the selection of its officials. The Pope, as Bishop of Rome, was chosen by the clergy and people of Rome. In the tenth century the Roman nobles controlled the papal elections, and the character of the popes whom they selected was such as to deprive the office of much of its dignity and authority. In the eleventh century the German emperors brought about a reform; they secured the deposition of unworthy claimants and the election of worthy German successors; but this Imperial interference was a fresh menace to the independence of the church. The local authorities of the church, the bishops and the abbots, were likewise elected by the clergy of the cathedral chapters and of the monasteries; but as the lands of the church were held as fiefs and the prelates were feudal vassals, the secular overlord naturally endeavored, and usually with success, to control the election of these authorities. The attempt of the great Pope, Gregory VII, to deprive feudal superiors of all influence upon the choice of bishops and abbots brought the papacy into conflict with the German emperors. In this conflict the emperors were supported by many of the German prelates whom they had practically appointed, while the popes were supported by most of the secular princes of Germany, who desired to weaken the Imperial power at home. (See INVESTITURE; GREGORY VII; HENRY IV; SAXONY; PAPACY.) The terms on which the conflict was ended (Concordat of Worms, 1122) were a compromise, defining more clearly the ecclesiastical and feudal rights. In the eleventh century, however, the basis was laid for the greatly increased power which the church exercised in the thirteenth century. The selection of the head of the church was intrusted to a body, the College of Cardinals, created by the head of the church. The interest of the feudal superior in the control of church elections was somewhat diminished by renewed prohibition of the sale of ecclesiastical preferments (simony) and by making it more difficult for those prelates who bought preferment to keep it. Finally, the renewal and attempted enforcement of the rules prohibiting the marriage of the clergy sought to secure for the church a body of servants removed as far as possible from all influences except her own. (See CELIBACY.) From the eighth century, when the Roman pontiffs denied the temporal sovereignty of the Emperor at Constantinople, the Eastern church, under the influence of the emperors and already tending to separation on account of disciplinary distinctions, drifted away from the Roman church. The separation became definite and final, in the eleventh century, in consequence of a doctrinal difference concerning the Procession of the Holy Ghost. The Eastern church never became independent of the secular authority, and its dependence facilitated the development of national churches. See BYZANTINE EMPIRE; GREEK CHURCH.

Age of the Crusades. In Spain the kings of León had gradually reconquered a fourth part of the peninsula, the Byzantine Empire had regained some of its territory, part of Italy had been wrested from the Moslems; but, on the whole, Christian Europe had remained for nearly three centuries on the defensive against Islam. In the eleventh century a new and ruder people, the Seljuk Turks, became dominant in Moham-

medan Asia, maltreated Christian pilgrims, and conquered Asia Minor (1071). At the appeal of the Greek Emperor, Pope Urban II called Christian Europe to arms (1095); and before the close of the century a great host of Crusaders had marched through Asia Minor and occupied part of Syria, establishing there a kingdom of Jerusalem and other principalities. (See CRUSADES.) The struggle thus opened continued for two centuries. The retainers of the Christian princes in Syria and the military monks (see HOSPITALERS; TEMPLARS, KNIGHTS; TEUTONIC KNIGHTS) constituted the standing army of the Christians; repeated crusades from all parts of Europe brought volunteer assistance. This phase of the struggle ended at the close of the thirteenth century with the evacuation of Syria by the Christians. An episode of the Crusades was the temporary overthrow of the Greek Empire (1204) by French Crusaders in alliance with Venice. A Flemish count (see BALDWIN I) was made Emperor at Constantinople, and the European territories of the Empire were divided between Venice and individual leaders. Greek emperors, meanwhile, continued to reign in Asia Minor; and in the latter half of the century, with the aid of the Genoese, one of them recovered Constantinople (1261) and part of the former possessions. The Venetians, however, kept much of the territory they had acquired, and became the leading commercial power in the eastern Levant; although the Genoese, on better terms with the Greeks, had control of trade in the Black Sea. The only permanent gains made by Christendom during these centuries were in Spain and on the Baltic. War against the heathen in these places also was regarded as a crusade. By the middle of the thirteenth century the Christians had conquered all of Spain except Granada; the Teutonic Knights had subdued and converted the Prussians; and another body of military monks, the Brethren of the Sword, were doing the same work in Livonia and Esthonia. In this same century, however, Christendom lost ground in eastern Europe through the conquest of Russia by the Mongols. See MONGOLIAN RACE.

The Papacy and the Western Empire. During these centuries the papacy, which had obtained the leadership of Christendom in the warfare for the Cross, attained its greatest power. The popes made and deposed kings, accepted whole kingdoms as fiefs of the church, and exercised jurisdiction in international controversies. The German emperors of the house of Hohenstaufen (1138-1254) seemed indeed almost as powerful as their predecessors of the eleventh century, who had made and unmade popes; and when by marriage the emperors gained control of the Norman Kingdom of Naples and Sicily, the independence of the papacy appeared to be seriously menaced. Among the German princes, however, and in the Lombard cities the popes found trustworthy, because interested, allies; and a century of intermittent conflict ended in the destruction of the Hohenstaufen dynasty. See GUELPHS AND Ghibellines; HOHENSTAUFEN.

Europe at the End of the Crusades. At the close of the thirteenth century Germany and Italy had become aggregations of practically independent principalities, secular or ecclesiastical, and of free cities. Kings were elected in Germany, and these kings called themselves Roman emperors; but they had almost no power in

Italy and little in Germany. Poland and Hungary were no longer even nominally subject to the Empire, and Burgundy was drifting to France. In the northeast, however, Germany had expanded by Saxon conquests and colonization, and the gains thus effected proved more durable than those made by the military monks. The kings of England had retained Normandy through the twelfth century and had acquired by marriage so many other fiefs that they ruled more than half of the French territory; but all these possessions except Guienne had been lost by the unlucky John early in the thirteenth century. In France, as in England, the crown had become hereditary, and at the close of the thirteenth century the power of the French kings was increasing. In Spain the united Kingdom of León-Castile (in which also the royal power was increasing) covered the greater part of the peninsula; but Portugal, independent since 1140, had attained its present boundaries, and all eastern Spain was ruled by the King of Aragon. During these centuries there was a great increase of commerce in west Europe. The control of European trade with the East passed out of the hands of the Greeks into those of the Italians, and a much more active traffic was developed on the trade routes between the Mediterranean and northern Europe, especially on those that ran through Germany. The result was a great increase in the wealth and power of the cities, first in Italy, later in Germany, France, and Spain. Everywhere the citizens bought or fought themselves free from their ecclesiastical or secular lords; in many parts of Europe the cities formed alliances for mutual protection. The league of the Lombard cities played an important part in the struggle between the popes and the emperors; the great league of the Hansa, which soon controlled the trade in the northern seas, was formed before the close of the thirteenth century. (See HANSEATIC LEAGUE.) It was a natural result of the increasing importance of the cities that their representatives were summoned to meet with the other estates of the realm in diets or parliaments. This occurred in the Spanish kingdoms in the twelfth century, in England and in Germany in the thirteenth century, and in France at the beginning of the fourteenth century. In the intellectual life of Europe the universities played an increasingly important part. The age of the Crusades was also the age in which scholasticism reached its highest development. It was also the age in which the study of the law books of Justinian was revived, and in the legists a new learned class appeared from which the kings and princes, heretofore dependent upon the clergy for their administrative officials, were able to draw servants more devoted to their interests. The cities furnished the wealth and power which in the following centuries made the monarchy independent of the feudal nobility; the legists formulated the theories and furnished the trained service which was to make the modern state independent of pope and church.

Changes during the Fourteenth and Fifteenth centuries. The consolidation of France was interrupted by a series of wars in which the English kings strove to make themselves kings of France also. (See HUNDRED YEARS' WAR.) In the fifteenth century, in alliance with Burgundy, Henry V of England came near accomplishing this end. The French dukes of Burgundy had obtained control of the Nether-

lands and aimed to establish an independent middle kingdom. (See **BURGUNDY**.) In 1435, however, Burgundy made peace with France, and within a score of years England had lost all its conquests except Calais. After the death of Charles the Bold of Burgundy, in conflict with the Swiss (1477), the greater part of the Netherlands passed, by marriage, to the Austrian house of Hapsburg, but Burgundy was annexed to France. By the union of Castile and Aragon (1479), and the conquest of Granada (1492) and of Spanish Navarre (1512), Ferdinand the Catholic became ruler of the entire Spanish peninsula, except Portugal. Thus, France and Spain came out of the Middle Ages as well-rounded national states. In each the crown was hereditary, and the royal authority was becoming supreme. In central Europe the conditions were very different. In Germany the emperors were chosen first from one house and then from another, that no precedents for hereditary succession might be created; and each emperor used his position to increase the territorial power of his own house. After 1438, indeed, emperors were regularly taken from the Hapsburg family, but this change of policy indicated only that the other territorial princes had become too strong to apprehend any revival of the Imperial power. Thus weakened, the Empire began to lose territory on every side. In the fourteenth century the Swiss became practically independent of the Empire; in the fifteenth they became a factor in European politics. In the latter century Burgundy passed definitively to France; Schleswig and Holstein were brought into personal union with Denmark; and the Prussian possessions of the Teutonic Order were partly annexed by Poland and partly held as fiefs from the Polish crown; Italy remained divided, for it was the policy of the popes to prevent any single state from obtaining a predominance which would threaten the independence of the Papal States. The wealth and weakness of Italy naturally attracted the stronger western states. Since the overthrow of the Hohenstaufen, Aragonian princes had ruled in Sicily and French princes at Naples. In the first half of the fifteenth century Aragon obtained control of both regions. Before the close of the century Charles VIII had invaded Italy to enforce the French claims to Naples, and the struggle for the control of the peninsula was opened. In the north and east of Europe, as in the west, larger political unions were forming. At the close of the fourteenth century all the Scandinavian countries were brought by the Calmar Union under a single ruler, and Norway remained united with Denmark until 1814; but Sweden was largely independent during the fifteenth century and became wholly independent in the sixteenth. In the latter part of the fourteenth century Poland was united with the recently Christianized Lithuania, and became, in territorial extent at least, an important state, stretching from the Baltic to the Black Sea; but the elective Polish monarchy never developed sufficient power to make this Slavic state permanent. At the close of the fifteenth century Russia freed itself from subjection to the Mongols. The most important event of this period, however, was the overthrow of the Greek Empire. In the middle of the fourteenth century the Ottoman Turks, having subdued Asia Minor, attacked the European territories of the Empire; before the end of

the century they had conquered nearly all of the Balkan Peninsula, and in 1453 they took Constantinople by storm. Long decadent, the East Roman Empire had, nevertheless, outlived the West Roman for nearly a thousand years; and it had held against Islam the southeastern gate to Europe for more than seven centuries. (See **MAP: EUROPE ABOUT THE YEAR 1500**.)

Close of the Middle Ages. Intellectually and spiritually the closing centuries of the Middle Ages represented ferment and growth. Renewed acquaintance with the literature of the ancient world (see **HUMANISM**) widened the narrow horizon of mediæval thought. The invention of printing immensely accelerated the diffusion of new ideas. The basis of political power also was shifted. The invention of gunpowder completed the change begun by English bows and Swiss pikes; it destroyed the military superiority of the armored horseman and the power of the feudal nobility. The opening by the Portuguese of the sea route to India, and the discovery, under the auspices of Spain, of a new world in the west, signified primarily for modern Europe the opening of new sources of wealth, and an increase of the power of the burgess class and of the crown. Later it was to signify the expansion of European civilization over the world; and, last of all, the subordination of European politics to world politics. At the close of the thirteenth century the power of the papacy had begun to decrease. England and France were already asserting, as other countries were later to assert, the right of the state to limit ecclesiastical jurisdiction and taxation and the taking of land into the "dead hand." (See **MORTMAIN, STATUTES OF**.) Early in the fourteenth century the French kings brought the papacy under their control, and for 70 years the popes were in exile at Avignon. Other popes were set up at Rome. The schism was ended by church councils in the fifteenth century, but reforms proposed by the councils were not carried into operation. Reformation through revolt found its leaders in Wiclif and Huss, and the attempt to crush the Hussite revolt led in the fifteenth century to a long and bloody war. See **WICLIF; HUSS; HUSSITES**.

The Period of the Reformation and the Religious Wars. The struggle between France and Spain for supremacy in Italy may be regarded as the beginning of the modern period of international politics. The Reformation (q.v.), by completing the disintegration of the Holy Roman Empire and dismembering Germany, made this country, too, a plaything for the ambition of other powers; it shifted the centre of European intrigue and conflict from south to north Europe. The expansion of firmly governed nations at the expense of nations lacking a strongly centred authority is perhaps the most marked feature of the succeeding period. Thus, France and Sweden grew at the expense of Germany, and later Prussia, Austria, and Russia grew at the expense of Poland, and Spain grew at the expense of Italy. The election of Charles I of Spain as Emperor in 1519 led to a protracted war with Francis I of France. In view of the overwhelming power of Charles, who, in addition to the Imperial title, united in himself the sovereignty of Spain with Naples and Sicily, the Austrian possessions of the Hapsburgs, and the enormous wealth of America and the Low Countries, the war assumed for Francis the character of a struggle for self-preservation.

Francis was fighting for nationalism and Charles for internationalism. (See CHARLES V; FRANCIS I.) The odds against the French King, however, were not so great as they seemed. He could depend upon the united strength of a firmly jointed nation; whereas Charles's multifarious interests and the very extent of his domains exposed him to attack from many sides. The Turks, the Protestants, the Pope at different times prevented Charles from bringing all his resources to bear against France, and that country, though defeated in four wars, suffered little loss in the end. The nature of the Reformation Charles in the beginning entirely failed to understand, and he neither made himself the leader of it nor did he consistently attempt to repress it. He thought he had settled the German difficulties by the Edict of Worms (1521). Protestantism, unmolested before 1530, spread rapidly over north Germany—originating, no doubt, in the prevalent abuses and laxness of discipline in ecclesiastical affairs, but finding favor, too, with the princes and knightly classes, whose anarchic ambitions it tended to confirm. After 1530 all efforts on Charles's part to stamp out the progress of the Reformation were vain; and though the victory of Mülberg (1547) over the German Protestants seemed for a moment to make him master of the Empire and of west Europe, he was compelled during the last years of his reign to make his peace with the Protestants (Passau and Augsburg) on the terms of *cujus regio, ejus religio*, and to see the French King actually the master of German soil (Metz, Toul, Verdun, 1552). With his abdication his huge Empire fell apart. The Imperial dignity was assumed by his brother Ferdinand, and the throne of Spain with its possessions in Italy and the Netherlands went to Philip II. With the overweening power of the Hapsburgs reduced and the fabric of the Holy Roman Empire crumbling under the progress of the Reformation, France's opportunity seemed to have come. But France itself fell a victim to religious strife and exhausted its energies in civil warfare (see HUGUENOTS); and it was not until the genius of Henry IV (q.v.) had reunited all factions that France was able to revive the anti-Hapsburg policy of Francis I and Henry II. The wide-reaching plans of Henry IV were interrupted by his death, but they were taken up and put into execution by Richelieu (q.v.), who instituted the famous French policy of Catholic at home but Protestant abroad. Nor did France find its opportunity gone after the lapse of 60 years, for on the part of its rivals this had been a period of steady degeneration. The bigotry of Philip II brought on the revolt of the Netherlands (Briel, 1572) and the loss of the northern provinces; and the strength of the Spanish monarchy was exhausted in the struggle with the Dutch and in the crusade against England. (See ARMADA.) In the Empire a succession of rulers, acting in the spirit of the Counter Reformation (Rudolph II, Matthias, Ferdinand II), drove the line of cleavage between Protestants and Catholics deeper than ever, and finally, by their aggressions on the reformed religion, brought on the Thirty Years' War (q.v.). This was Richelieu's opportunity. Originally a conflict for religion between members of the Empire, the war, with the incursion of Gustavus Adolphus (q.v.), developed into a war for booty on the part of Sweden and France.

Europe in 1648. The Treaty of Westphalia (q.v.) confirmed the dismemberment of Germany by reducing the power of the Emperor to a shadow, by making the members of the Diet virtually independent, by erecting in Germany 268 secular states and 65 ecclesiastical principalities. Sweden gained extensive territories on the south shore of the Baltic, and France was confirmed in its possession of the three bishoprics, received territory in Alsace, and gained a foothold on the right bank of the Rhine. Westphalia left France the strongest power in Europe, and for a time France possessed in Sweden a powerful ally. Spain was forced to acknowledge the independence of the Netherlands and, though still retaining its Italian possessions, was moribund. The Emperor recognized the independence of Switzerland, and, with the increased power of the Diet, his authority became restricted practically to his personal dominions, whose safety was threatened by the Turks. These had become and were still the masters of the greater part of Hungary, with its capital, Buda. South Italy, the Italian islands, Milan and Mantua, were ruled by foreign masters. Poland was weltering in anarchy and fast slipping to its doom. Russia had not yet found a great ruler to bring it on the stage of European history.

The Period of Dynastic Wars (1648-1703). From Westphalia to Utrecht international relations in Europe were dominated by the aggressions of France, which, after passing through a period of civil disorder (see FRONDS), attained under Louis XIV (q.v.) such power as to threaten for a time the other states of Europe with the same fate that France had feared from the power of Charles V. The European states were forced to unite against him—Holland, England, and Sweden in 1667; Holland, Spain, Brandenburg, and the Empire in 1672; Holland, England, Spain, Sweden, the Empire, Bavaria, and Saxony in 1689. In the course of these wars the theory of the balance of power was worked out in great detail, and the War of the Spanish Succession (1701-14), in which the French armies were repeatedly worsted, demonstrated the superiority of the state system of Europe to the power of any single state, no matter how strong. (See GRAND ALLIANCE.) The defeat of Louis XIV carried with it the overthrow of the Swedish power in Germany. Brandenburg, strengthened by its union with Prussia (1618), and under the astute guidance of the Great Elector (1640-88), had made common cause with the enemies of Louis XIV, and by its victory over the Swedes at Fehrbellin (1675) had entered upon its destiny as the successor of Sweden on the southern shores of the Baltic. While Louis XIV was battling against the Grand Alliance, Sweden was assailed by Denmark, Poland, and Prussia, and, in spite of its heroic King (see CHARLES XII), lost all of its possessions on the south shore of the Baltic with the exception of a small part of Pomerania; Prussia and Russia entering into its inheritance. The treaties of Utrecht (1713), Rastadt (1714), and Nystadt (1721) signalized momentous changes in the political balance of Europe, and things began to assume an aspect that is familiar. The power of France was checked by the aggrandizement of Austria, which now obtained possession of the Spanish Netherlands and became the dominant power in Italy. France lost the control of the sea to England, which entered upon a successful career of commerce and colonization.

Prussia was raised to the rank of a kingdom and stood forward as the leading state of north Germany. Russia under Peter the Great gained a foothold on the Baltic at the expense of Sweden. Savoy was made a kingdom and by the acquisition of Sardinia became a prominent factor in Italian affairs. The period that follows to the French Revolution was in general one of development on these lines. France, exhausted by the wars of Louis XIV and the excesses of his profligate successor, steadily declined in power in spite of a temporary success over Austria in the War of the Polish Succession (1733-35). Prussia, under the able and unscrupulous Frederick the Great (q.v.), assumed the leadership in Germany and held it in the great Seven Years' War (q.v.) against the united forces of Austria, France, and Russia. In this struggle Prussia received some aid from England; but England was more actively interested in world politics than in the continental politics, and to England fell the immense possessions of France in the New World and the ultimate control of India. Russia increased its territory at the expense of the Turks, who, after their great defeat at Vienna (1683), had rapidly been swept back, Carlovitz (1699), Passarowitz (1718), Kutschuk Kainardji (1774), marking the steady decline of their power. The greed for territory, since 1648, the moving spirit of European politics, reached its climax in the despoliation of Poland (1772, 1793, 1795) by Russia, Prussia, and Austria, acting under the inspiration of Catharine II.

Reform and Revolution (1763-1815). In the three decades of peace which followed the Seven Years' War the attention of European sovereigns was directed chiefly towards the internal problems of state. This was the age of benevolent despotism, when monarchs sought to reconcile the theory of absolute government with the new ideas concerning the rights of man emanating from France. Joseph II of Austria, Catharine II of Russia, Frederick the Great, Leopold of Tuscany, and Pombal in Portugal carried out far-reaching reforms in church and state without conceding any increased share in the government to the people. The states of Europe were thus mere governing machines rather than true nations, and they showed little stability when the outbreak of the French Revolution assailed the old form of things. In France (q.v.) the Revolution swept away all hereditary privileges and disabilities, destroyed monarchy, and for a time transformed the state into a confederacy of independent communes. The zeal of liberated France to extend to its neighbors the blessings of freedom, and the apprehensive hostility of the rulers of the monarchic states, brought on a series of European wars. The reaction in France against anarchy, and the stress of foreign conflict, made Napoleon (q.v.) absolute ruler of France, with governmental power more completely centralized than under the Bourbons. Napoleon's ambition converted the revolutionary wars into Napoleonic wars, and his military and political genius made him master of half of Europe. He took the title of Emperor of the French and regarded himself as the successor of the Frankish emperors. (See Map: EUROPE AT THE TIME OF NAPOLEON'S GREATEST POWER.) The Emperor in Vienna, who claimed the same position, surrendered his title in 1806, henceforth calling himself Emperor of Austria only; and thus

ended the Holy Roman Empire, the most venerable and the emptiest of surviving mediæval institutions. To at least one of the principles of the Revolution Napoleon remained faithful. As far as his authority or influence reached, class distinctions were swept away, and all men became equal before the law. By independent legislation Prussia and other states took long steps in the same direction. (See STEIN.) This was the one great direct result of the revolutionary propaganda. For political liberty and popular government in Europe, Napoleon of his own will did nothing; nor was it his purpose to contribute in any way to the establishment of national states in central Europe. These things were not compatible with his European empire. The seeds of democracy, however, had been sown in the early years of the Revolution; and national feeling was fostered among the peoples of Europe by the struggle against foreign rule which Napoleon forced upon them. Knowing that the dynastic method of warfare would be unavailable to make head against him, the monarchs were forced to make common cause with their subjects. The constitution of 1812 in Spain, the organization of local self-government and of a popular army in Prussia, were results of French aggression; and it was the national forces of Spain that prepared Napoleon's downfall, as it was the national levies of Prussia that helped to consummate it. By establishing legal equality and by awakening the desire for national self-government the Revolution gave a unity to subsequent developments in Europe, which had not been seen since the Reformation broke up the uniformity of the mediæval civilization. Yet Europe, after the fall of Napoleon, entered on a period of sharp recoil from the ideals of the Revolution. At the Congress of Vienna (1814-15) the Powers, under the leadership of Austria, made a deliberate attempt to return to the conditions that had prevailed before 1789. The map of Europe, with which Napoleon had played havoc, was reconstructed in the interest of "legitimacy" and "convenience" and of the balance of power, that great ideal of eighteenth-century statecraft. France was restricted to her ancient boundaries. Belgium and Holland were united into a kingdom to keep watch on the northern boundary of France. Norway was taken from Denmark and given to Sweden to make up for the annexation of Finland by Russia. Russia received also the Grand Duchy of Warsaw, which was organized as a separate kingdom of Poland. For the unity of Germany and of Italy nothing was done. Prussia and Austria were both strengthened. Prussia gained territory chiefly in north and west Germany, Austria in Italy. The smaller German states and free cities, greatly reduced in number, were united with Prussia and Austria in a German confederacy, in which Austria held the presidency. In Italy Sardinia was strengthened; but Austria held a dominant position in the north. The Papal States were reestablished, and Naples and Sicily were restored to their Bourbon ruler. (See Map: EUROPE AFTER THE CONGRESS OF VIENNA.)

Reaction and Revolution (1815-52). The purpose of the Congress of Vienna was to reestablish legitimate monarchic authority. To maintain this authority and to resist all revolutionary movements, an alliance was formed by the emperors of Russia and Austria and the King of Prussia. (See HOLY ALLIANCE.) Of this

alliance and of the reactionary policy followed by the majority of the European governments till 1848. Metternich (q.v.), the Austrian Minister, was the directing spirit. Among the peoples of Europe, however, there was a natural desire for some share in government; and in Germany and Italy there was a strong desire for national unity. The attitude of the princes made it appear impossible that unity could be attained except through popular sovereignty. For this reason the nationalists in Germany and Italy became revolutionists and to a large extent republicans. Revolutionary agitation was maintained by secret associations. (See BURSCHENSCHAFT; MAZZINI; YOUNG ITALY.) The first popular outbreaks occurred in 1820 in Spain and in Naples. In each of these kingdoms the monarch was forced to grant a liberal constitution. Acting under the authorization of European congresses, Austria forcibly intervened in Naples and France in Spain; the objectionable constitutions were withdrawn, and absolute royal government was reestablished. In 1821 Greece revolted from Turkey and with the aid of England, France, and Russia, achieved her independence. The next purely political outbreak occurred in 1830 in France. Louis XVIII had granted his people a constitution and had reigned in peace. Charles X attempted to subvert the constitution and was deposed. (See JULY REVOLUTION.) Louis Philippe, of the house of Orléans, was made King, and a more liberal constitution was adopted. The French example stirred the Liberals to action in other parts of Europe. In Germany a few of the smaller kingdoms and principalities had already received representative constitutions; in 1830, in consequence of popular demonstrations, nearly all the other minor states were constitutionalized. The governments of Prussia and of Austria, however, made no such concessions. In Belgium and in Poland insurrections occurred, which were national rather than political. The Belgians revolted against the Dutch rule and elected Leopold of Saxe-Coburg as their King; and France and England forced Holland to recognize Belgian independence (1831). Poland rebelled against its King, the Russian Czar; but this rebellion was crushed, and Poland became a Russian province. In 1848 France was again in revolution. (See FEBRUARY REVOLUTION.) Louis Philippe had resisted the demand for a wider suffrage and was deposed. A republic was established; a struggle followed between the socialistic and conservative elements; a socialistic rising in Paris was put down with much slaughter; Louis Napoleon was elected President. Three years later the President overthrew the constitution, and in 1852 he assumed the title of Emperor. (See NAPOLEON III.) Both of these changes were approved by vote of the French people. In 1848, as in 1830, the disturbances at Paris were followed by disturbances throughout central Europe. Popular uprisings at Berlin and Vienna forced the Prussian and Austrian rulers to grant constitutions. Here and everywhere else in Germany the revolutionary leaders also demanded national unity. All the German kings and princes bowed to the storm, and a parliament was assembled at Frankfurt to draw up a constitution for a united Germany. Simultaneously the people of Schleswig-Holstein took arms against Denmark and demanded that these duchies should be incorporated in the new Germany; while the Bohe-

mian, Hungarian, and Italian subjects of Austria rose against German rule. The Austrians were driven out of Lombardy and Venice, and throughout the rest of Italy the people either expelled their princes or forced them to send troops to the aid of the insurgent Venetians and Lombards. The united Italian forces were placed under the command of the King of Sardinia. All these movements came to nothing. The Austrian army restored order in Bohemia and at Vienna, and defeated the Italians. With the aid of Russia, the Hungarian insurrection also was crushed. All the Italian princes recovered their thrones, the Pope, who had been expelled from Rome, was reinstated by Napoleon. The Frankfurt Parliament, after long deliberation, determined to organize all Germany except Austria as a federal empire, and offered the King of Prussia the Imperial crown. He declined the offer, and the German Parliament dispersed. A belated attempt of the King of Prussia to organize the "narrower Germany" on more conservative lines than those proposed at Frankfurt also failed. The old confederation was reestablished, and the people of Schleswig-Holstein were again made subject to the King of Denmark. Thus, after many revolutions, we find the conservative *status quo* of 1815 still existing.

Eastern Affairs (1815-56). In 1821 a rising against the Turks in Wallachia gave the signal for insurrection in Greece. After several years of conflict Russia, England, and France intervened. The Allies destroyed the Turkish-Egyptian fleet at Navarino (1827), and Russia declared war on Turkey (1828). The Peace of Adrianople (1829) guaranteed to Serbia, Wallachia, and Moldavia the management of their own affairs under Christian governors and made Greece independent. Greece was organized as a kingdom under Otto of Bavaria (1832-62). In 1831 war broke out between the viceroy of Egypt, Mehemet Ali, and his suzerain, the Sultan, and the Turkish forces were worsted. Russia intervened and brought about peace, taking pay for its services in a treaty of alliance (Unkiar-Skelessi, 1833) which practically gave it a protectorate over the Turkish Empire. In 1853, after attempting to arrange with England a partition of the Turkish Empire, Russia occupied the Danubian principalities. Austria and Prussia assumed an attitude of unfriendly neutrality; England and France came to the aid of Turkey, and carried the war into Russian territory. (See CRIMEAN WAR.) The Peace of Paris, 1856, pushed Russia back from the mouth of the Danube (Bessarabia, previously Russian, being ceded to Moldavia), neutralized the Black Sea, and placed Turkey under the protection of Europe. In return Turkey promised reforms.

National Organization of Italy and of Germany (1850-71). The unification of Italy and of Germany, which the popular revolutions of 1848 had failed to achieve, was accomplished by revolution from above. In Italy the movement was initiated and directed by the Sardinian premier, Cavour (q.v.); in Germany it was carried through by the Prussian premier, Bismarck (q.v.). Austria was the great obstacle to both movements, and it took two great wars to expel the Austrians from Italy and from Germany. It was not in the interest either of Russia or of France that strong states should be established in central Europe; but Russia remained neutral, because, remembering the aid given to Austria in 1849, the Czar bitterly resented the

"ungrateful" attitude assumed by Austria during the Crimean War; and Napoleon III (q.v.) assisted Sardinia and encouraged Prussia, partly in expectation of petty advantages, partly by reason of an unpractical zeal for the "principle of nationality." In 1859 France and Sardinia defeated Austria, and Sardinia obtained Lombardy. France was later paid for her services by the cession of Savoy and Nice. Simultaneously all the small states of north Italy and the northern provinces of the states of the church established revolutionary governments and demanded union with Sardinia. In 1860 Garibaldi (q.v.) overthrew the Kingdom of the Two Sicilies and placed all Italy south of Rome in the hands of the King of Sardinia. In 1861 the Kingdom of Italy was established, including all the peninsula except Venice held by Austria, and Rome held by the Pope with the assistance of France. During these movements Prussia stood inactive. In 1863 Denmark, in violation of its treaty engagements, endeavored to incorporate Schleswig. Prussia, of which Bismarck was now Premier, acting in concert with Austria, made war on Denmark, and the Allies obtained joint sovereignty over Schleswig-Holstein (q.v.). In 1866, in alliance with Italy, Prussia made war on Austria. Austria was supported by all the south German states and by the more important states of north Germany, but victory rested with Prussia. (See SEVEN WEEKS' WAR.) Italy obtained Venice as a reward for her alliance with Germany; Prussia annexed a considerable part of north Germany, and organized with the remaining principalities and cities a north German federal state, of which the King of Prussia was hereditary President. Failing to obtain any compensation for his benevolent neutrality, Napoleon III was forced by French popular feeling to quarrel with Prussia and to endeavor to arrest the unification of Germany. In the ensuing war (1870-71) the south German states acted with Prussia; and during the German siege of Paris King William of Prussia was proclaimed Emperor of a united Germany. To this new Empire France was forced to cede Alsace and a part of Lorraine. (See FRANCO-GERMAN WAR.) During the war Italy annexed Rome (1870).

The Roman Catholic Church and the Modern States. Just before the occupation of Rome by the Italians, an Ecumenical Council (1869-70) had defined the dogma of papal infallibility. Viewed politically, this dogma signifies the complete subjection of the bishops to papal authority and the centralized guidance of the church militant in its struggle against what it regards as the usurpations of the modern states. Simultaneously Catholic or "Ultramontane" parties were organized (or reorganized) in many of the European states; and while these parties deny the right of the church to direct their political activity, they are supported by church influence and work in accordance with the general policy of the church. In Prussia and other states these movements have led to legislation intended to check the political activity of the clergy and to diminish the control of the church over education. (See KULTURKAMPF.) The furthest step was taken by the French Republic in 1902 in the effort to resist and supervise education by the clergy.

The Eastern Question (1856-1914). The Eastern Question had been the outstanding problem of Europe almost from the time when the

Turks entered Constantinople in 1453. Although individual nations had been interested in the Balkans for special reasons, the question was primarily European, owing to the general fear that the dominance of one power in Turkey, particularly Russia, would disturb the balance of power and so upset international relations. For this reason every important state in Europe, no matter how remote its interests in the Balkan Peninsula, has been deeply concerned in the fate of Turkey.

The Peace of Paris, which closed the Crimean War, although it settled little or nothing, marks the first attempt of Europe as a whole to solve the Eastern Question. Turkey came out of the struggle not only unscathed but "respectable"; she was formally admitted into the family of nations; her independence was recognized, and her territory guaranteed. This treaty was signed by representatives of Russia, England, France, Prussia, Turkey, and Sardinia. The assistance given by the Christian Powers to the Turk made him feel safe in oppressing his Christian subjects, because they looked to defeated Russia for help; and it became a policy of the Porte to play off one Christian power against another in order to continue its tyranny undisturbed. The history of Turkey during the nineteenth and twentieth centuries is a dreadful story of massacres, riots, uprisings, and assassinations. Europe looked on, uneasy and conscience-stricken, but loath to interfere unless its interests were threatened. The frightful Bulgarian atrocities of 1876 brought denunciation from England, but war from Russia, which made itself the champion of the Greek Orthodox Slavs in the Turkish Empire. Once more Russian armies marched into Turkey (see RUSSO-TURKISH WAR) and compelled the Ottoman government to sign the humiliating Treaty of San Stefano (1878). The Mohammedans were to be turned out "bag and baggage," when England, fearing increased Russian prestige, declared that the question could be settled only by a concert of the Powers. A great congress was then called at Berlin in 1878 (see BERLIN, CONGRESS OF), which undertook the dismemberment of European Turkey. The independence of Montenegro, Servia, and Rumania was recognized; a new state, Bulgaria, was called into existence, and Austria was to "administer" the provinces of Bosnia and Herzegovina. The results of the Congress of Berlin were very important: 11,000,000 Christians were freed from Turkish misrule; Russia, thrice frustrated in her attempt to get Constantinople, turned her attention to the Far East; Austria entered as a vital factor in the situation; and, finally, a new group of Balkan nations made their appearance, and these soon became ambitious to settle the Eastern Question in their own interests.

One thing remained unchanged—the tyranny of the Turkish government, which, under Sultan Abd-ul-Hamid II, became more intolerable than ever. Suddenly, in July, 1908, the impossible happened: a revolution against the Sultan by the Turks themselves. A progressive element among the Mohammedans, known as the Young Turks, organized a powerful society known as the Committee of Union and Progress, which got control of the army and deposed Abd-ul-Hamid. A constitutional government was then established. Mohammed V, brother of the deposed Sultan, was chosen as his successor, and a popularly elected parliament was organized. The

Young Turks were dominated by the European ideals of democracy and nationality. They wished to modernize the Turkish government and society, reform Mohammedanism, and particularly to weld the various races into a true Turkish nation. They failed miserably, either because the task was too great for them or because they came too late on the scene. The Mohammedans became angry at the equal treatment given to the Christians by the new régime; the latter began plotting to join their kinsmen in the Balkan States; the army was unpaid and discontented; revolts among the semisavage tribesmen became frequent; and the leaders among the Young Turks were inexperienced and incapable of handling a new situation. Worst of all, came financial embarrassment. It soon became evident that there could be no solution of the Eastern Question without a dissolution of the Turkish Empire.

On Oct. 7, 1908, there took place the great diplomatic *coup* of Baron von Aehrenthal, the Austrian Foreign Minister, who announced the formal annexation of Bosnia and Herzegovina to Austria, thus breaking the Treaty of Berlin. There was great resentment against this action all over Europe, particularly in Serbia. Six years later (July, 1914) Archduke Francis Ferdinand, the heir to the Austrian crown, was assassinated in Bosnia by a patriotic Servian. See WAR IN EUROPE.

Italy, which had marked out northern Africa as its field of colonial expansion, suddenly declared war (Sept. 29, 1911) against Turkey and seized Tripoli. (See ITALY, *History*.) In the fall of 1912 the Balkan States, taking advantage of the embarrassment of Turkey, entered into an alliance and declared war against their old enemy. (See BALKAN WAR.) In the campaigns that followed, the Turkish armies were completely defeated by the allies, who were marching victoriously to Constantinople. The Turk was about to be driven out of Europe at last when the allies began to quarrel amongst themselves. As a result, Constantinople and Adrianople with their adjacent territories remained under the Ottoman flag, but nearly all the rest of European Turkey was divided among the Balkan States. Albania was created into an independent state, with Prince William of Wied as its ruler. The enlarged Balkan nations became a source of uneasiness to Europe in general and to Austria in particular. There was fear of the possible appearance of a federal Slav state which would disturb the balance of power and create rebellion among the Austrian Slavs.

European Alliances. The emergence of Germany as one of the most important of the European Powers necessitated a readjustment of international relations. It was Bismarck's constant policy to be on good terms with Russia so as to prevent her from falling into the arms of France. With this idea in view, he organized in 1872 the Dreikaiserbund, or Three Emperors League, composed of Germany, Austria, and Russia. For reasons best known to the secret history of diplomacy, Germany and Russia became estranged, and the league became a dead letter. This was France's opportunity, and she immediately began making overtures to Russia for an offensive and defensive alliance.

In the mean while the Italians were greatly angered by the French occupation of Tunis—"the last door open to Italian expansion," as it

was then thought. Moreover, there was great fear that the French clericals were plotting to restore the Pope to his temporal power. For these reasons Italy joined Germany and Austria in forming the famous Triple Alliance organized by Bismarck in 1882. What the terms of this treaty are have never been revealed; it is surmised, however, that the Triple Alliance would aid Germany in case of an attack by France, would promote Austrian interests in the Balkans, and encourage Italy in her policy of colonial expansion. Although the treaty has been renewed several times, rumor has it that its effectiveness is gone. Since the annexation of Tripoli, Italy, never very happy under the burden of militarism required of her by the alliance, has shown a lack of interest in the treaty. For this reason Germany and Austria have drawn more closely together.

The Franco-Russian *entente* became a hard and fast Dual Alliance when, in 1897, at an official banquet, Czar Nicholas II toasted President Félix Faure of France as "my friend and ally." Like the Triple Alliance, the Dual one is mainly defensive. Russia is to help France in case of an attack by Germany and in return French loans are to be forthcoming to the Russian government.

Diplomacy, no less than politics, makes strange bedfellows. The common fear of Germany has drawn together the century-old enemies, England and France, into a semialliance known as the *entente cordiale*. In a war with Germany the English fleet would be of great value to France and the French army to England. The effectiveness of this understanding was tested in the Morocco affair (see MOROCCO, *History*), as the loyal support given by England to France's determination to annex Morocco in 1911 was mainly responsible for the diplomatic rout of Germany on that occasion. Russia's alliance with France has made the *entente cordiale* into a *Triple Entente*, with the result that Germany's position in Europe has become rather precarious. The international crisis of 1911 was directly responsible for the increase of armaments among the nations of Europe. Germany added in 1913 about 40,000 men to her already enormous standing army; and France, not to be outdone, passed the three years' military service law (see FRANCE, *History*), because her stationary population made it impossible to increase her army without increasing the term of service.

Europe in the Twentieth Century. The population of Europe in 1914 was about 425,000,000, an average yearly increase in the previous decade of over 3,000,000 in spite of the large emigration. There is no distinct and definite European race, for all the peoples are of mixed origin. But taking language as a test and grouping cognate languages, about 31 per cent of the inhabitants are Slavs, living mainly in the eastern part; about 27 per cent are Latins, living in the southern and western parts; and about 32 per cent are Teutons—Germans, English, Scandinavians, Dutch, and Flemings—living mainly in the north. There are also the so-called non-European races, like the Finns, Hungarians, Turks, and Jews, who make up the remaining 10 per cent. About 95 per cent of the population are Christians, divided roughly into 45 per cent Catholic, 26 per cent Orthodox, and 26 per cent Protestant. Politically Europe consists of 26 independent states:

four empires, viz., Russia, Germany, Austria-Hungary, and Turkey; 13 kingdoms—Great Britain, Spain, Italy, Belgium, Greece, Holland, Sweden, Norway, Denmark, Bulgaria, Servia, Montenegro, and Rumania; 4 principalities—Albania, Monaco, Lichtenstein, and the Grand Duchy of Luxemburg; and 5 republics—France, Switzerland, Portugal, Andorra, and San Marino. Two are federal states, Germany and Switzerland; one dual, Austria-Hungary; and the rest are unitary. In none does absolute monarchy as a form of government exist, although in Russia constitutionalism is of a very weak variety. The system of parliamentary government based upon the English model has been adopted in one form or another in every European state. Industrially England, Germany, France, and Belgium are most advanced; eastern and southern Europe are still largely agricultural, although the industrial revolution is making rapid headway in these places.

The twentieth century is witnessing the rapid spread of European civilization to the old nations of Asia and to the savage races of Africa. The coming of the missionaries preaching what has become a European religion, Christianity, and the desire of the manufacturers and capitalists to develop the resources of the backward countries of the world, has profoundly affected the life of non-European peoples. Factories, railways, telephones, printing presses, and steamboats are almost as common in China, India, and northern Africa as they are in Europe and in America. The world is rapidly acquiring a common civilization, which has not only been created but spread by Europeans.

EUROPE, PEOPLES OF. All Europeans belong to the White, or Caucasian, and the Yellow, or Mongoloid, varieties of man. Throughout historic time Europe has been a meeting ground of races, differing from each other in complexion, stature, physical features, temperament, language, occupation, social organization, government, opinion, and religion. In studying the ethnology of this portion of the Eastern Hemisphere it is imperative to hold these several categories apart in the mind, especially those of race or blood kinship, the result of crossbreeding; speech or linguistic affinities, the result of acculturation; arts, the result of commerce or contact; and social life or nationality, the result of conquest. It is true that these concepts are related, and each is of value in the whole account of any people. When, however, one attempts to argue that people who speak the same language or practice the same arts are necessarily akin, confusion is certain to arise.

Beginning with the first account of ancient

man in Europe, paleöthnology may be divided into three parts: (1) Tertiary man, or the origin of humanity; (2) Quaternary man, or the development of humanity; (3) present types of man. It is to be distinctly understood that this classification is intended only as a guide to study. New discoveries are constantly demanding new adjustments with reference to the earliest races of men in Europe.

The existence of Tertiary man is yet in doubt, for our sole information concerning him rests upon the finding of extremely rude stone implements (called eoliths) in geological layers which are thought to be Tertiary. These supposed primitive implements, so far as their shape is concerned, might be only the refuse of later manufactures of more delicate objects. For in America, where at first materials of this character were regarded as showing the existence of man on this continent many thousands of years ago, they are now known to be the quarry refuse of historic tribes. In Europe the argument against the eoliths rests on the suspicion that the supposed indications of use by human hands are merely the product of natural causes. Thus, the demand is made that eoliths, in order to be recognized as genuine, should be made of material foreign to the deposit in which they are found. Nevertheless, Obermaier, who takes a very skeptical attitude towards both Tertiary man and the eolithic problem, admits the possibility of both and accepts as reasonable the view that the earliest paleolithic tools must have developed from simpler forms, however difficult it may be to differentiate these from unworked stones.

Still keeping in mind geological epochs, European archaeologists divide human culture into Prehistoric, Protohistoric, and Historic. Again, it is thought possible to separate the life of man in Europe into ages according to the materials which characterize the several periods, as the Stone age, Bronze age, and Iron age. It must be remembered at this point, however, that the word "age" does not refer to definite chronological dates, but that in the progress of human development man lived first in the stone grade, next in the bronze grade, and lastly in the iron grade of culture.

Leaving out of view, then, the question as to the existence of man in the Tertiary period, substantial exploration begins with the Quaternary epoch. In his investigations there the inquirer is everywhere confronted by problems concerning cosmic changes in climate, the plants and animals which were contemporaneous with man during these changes, the species or varieties of man based on the human crania actually discovered, as well as on the progress in arts, especially those in stone. Notwithstanding the speculative character of much that is affirmed about Quaternary man in Europe, an examination of the accumulated evidences leaves the impression of a long perspective of history, in which the life of the species was gradually transformed by human ingenuity into the higher culture, the life wherein nearly every conscious action is performed artificially. On the assumption that the forward movement of this artificial life is an unquestionable fact, the relics of human industry discovered in the caves and other archaeological stations throughout all the countries of Europe may be mapped out in a series. Attempts have been made to mark epochs in this progress, and names have been given to them

from locations where typical specimens of that particular grade of art were to be found, beginning with the Chellean, and ending with the Tourassian for the Paleolithic period.

EUROPEAN PALEËTHNOLOGY

Times	Ages	Periods	Epochs
Actual or Recent Quaternary	Historic	Merovingian	Wabedian (Waben, Pas-de-Calais).
		Roman	Champdolian (Champdolent, Seine-et-Oise). Lugdunian (Lyon, Rhône).
	Of iron	Galatian	Beuvraysian (Mont Beuvray, Nièvre). Marnian (Department of the Marne). Hallstattian (Hallstatt, Austria).
		Taigianian	Larnaudian (Larnaud, Jura). Morgian (Morges, Vaud, Switz.).
	Of bronze	Neolithic	Robenhausian (Robenhäusen, Zurich). Azylian (Mas d'Azil, Ariège).
			Magdalenian (La Madeleine, Dordogne). Solutrean (Solutre, Saône-et-Loire).
		Paleolithic	Aurignacian (Aurignas, Haute Garonne). Mousterian (Le Moustier, Dordogne). Acheulean (Saint-Acheul, Somme). Chellean (Chelles, Seine-et-Marne).
			Puyecourman (Puy-courmy, Cantal). Thenaysian (Thenay, Loir-et-Cher).
		Eolithic

Ancient Quaternary	Prehistoric	Paleolithic	
Tertiary			

A fair number of skeletal remains to which the title Quaternary has been applied can now be vouched for as beyond question.

All the finds may be grouped as belonging to one of two races—the Neanderthal race, which shows striking differences from modern man, and the Cro-Magnon race, which clearly exhibits affinity with him. The oldest of all the remains is the jaw unearthed in Mauer, near Heidelberg. It belongs either to the Old or the Middle Quaternary, and Obermaier's avowedly most conservative minimum estimate sets its age at 100,000 years. Clearly human in its teeth, this find resembles other Neanderthal remains in its chinless character and surpasses all in primitiveness by virtue of the extraordinary massiveness of the jaw. A remarkable find made in December, 1912, near Piltown, Sussex, by Dawson, consisting of part of a skull, a lower jaw, and a

canine tooth, has been the subject of vigorous discussion, especially by Drs. Keith and Smith Woodward, the latter assigning it to a distinct genus of humanity, which he dubs *Eoanthropus dawsoni*. The interest of the find, which some regard as contemporaneous with Chellean objects, lies in the incongruity of the distinctively human forehead with the apelike jaw.

Among the best-known remains of the Neanderthal type may be mentioned a burial at Le Moustier belonging to the Late Acheulean or Old Mousterian epoch, the burials of La Ferrassie and La Chapelle-aux-Saints (Mousterian), the jaw of La Naulette, and the two Spy skeletons (all from Belgium and of the Mousterian epoch), the Neanderthal skull proper (of uncertain epoch, but almost certainly Old Paleolithic), and the Croatian skeletons from Krapina (Late Chellean). All these and other Neanderthaloid remains point to a thickset race of short stature (160 centimeters), with low, long, and narrow skullcap, receding forehead, very prominent brow ridges, and massive lower jaw without projection of the chin. The Neanderthal type was not by any means uniform, however. Thus, while the West European specimens of the race indicate dolichocephalic skulls (70 to 75.7), the Krapina fragments show a distinct tendency to brachycephaly.

The Cro-Magnon race certainly dates back to Aurignacian times, as proved by the skeletons of Mentone, Cro-Magnon and Laugerie Haute (Dordogne), and Combe-Capelle (Périgord). Important Magdalenian finds were made at Laugerie Basse, La Madeleine, and Chancelade (all in the Dordogne district). The tendency to variation was far more strongly pronounced among the Cro-Magnon people than among their Neanderthaloid predecessors and contemporaries. Thus, the skeletal remains in the Grimaldi grottoes point to a lofty stature of 187 centimeters (6 feet, 1½ inches), while that of the Combe-Capelle man does not seem to have exceeded 166 centimeters. In all Cro-Magnon specimens, however, the skullcap is high, the brow ridges are unobtrusive, the jaw is less massive, and there is a pronounced chin. There is marked dolichocephaly, the index being 65.7 for that from Combe-Capelle, but with a considerable range of variation (Cro-Magnon, 73.8). Some of the Grimaldi remains have been interpreted as belonging to a Negroid people, but this conclusion has not been definitely established. The precise relations of the Neanderthal and Cro-Magnon races are by no means clear. Among other hypotheses it has been suggested that the Cro-Magnon men did not develop from the Neanderthals, but originated outside of Europe, immigrated, became in part blended with the native populations, and ultimately supplanted them.

After these Paleolithic epochs, during which man attained not only his present physical type, but also a very creditable degree of industrial and artistic culture, came the Neolithic or Polished Stone period, followed by the Bronze or Tsiganian period, and this by the age of Iron. These changes did not come by sudden breaking down of the Stone and Bronze ages, but by transitional steps with a separate history in each of the countries of Europe. For instance, the Polished Stone period was not developed simultaneously over the continent. Scandinavia, in its northern parts, was covered with glaciers, and only in the refuse piles in Denmark are polished-stone hatchets found contemporaneously

CLIMATIC AND OTHER CHANGES IN THE PALEOLITHIC EPOCHS

NO	Climate	Geologic action	Plants	Animals
1 Azylian	As at present			Fauna of to-day, <i>Cervus elaphus</i> abundant. Reindeer disappears.
2 Magdalenian	Cold and dry	Formation of red earth with angular pebbles	Polar moss in Württemberg	Man, race of Laugerie Basse Great development of northern fauna, reindeer, etc. Extinction of mammoth.
3 Solutrean	Mild and dry	Retreat of the glaciers		Horse abundant. Reindeer. Mammoth. Increase of rhinoceros
4 Aurignacian	Cold	Gradual retreat of glaciers		Mammoth, Siberian rhinoceros reindeer, cave bear, bison horse. Man: Cro-Magnon race
5 Mousterian	Cold and moist	Great extension of glaciers, and consequent changes of the soil and levels	Flora of cold regions	Arctic fauna. Mammoth, <i>Rhinoceros tichorinus</i> , cave bear, musk ox.
6 Acheulean	Mild and moist	Alluvium of the high levels. Loam of the plateaus	Flora in transition	Fauna intermediate. Appearance of mammoth. Disappearance of <i>Elephas antiquus</i> .
7 Chellean	Warm and humid	Subsidence. Filling of the valleys. Alluvium everywhere at lower levels	Flora subtropical. Mediterranean plants in Seine valley	Man. Neanderthal race. Tropical fauna. Hippopotamus. <i>Rhinoceros merckii</i> , <i>Elephas antiquus</i> . Extinction of Tertiary forms.

CLASSIFICATION OF QUATERNARY CULTURE IN EUROPE

PERIOD	Epoch	Technic	Characteristic implements
End of the Paleolithic	Azylian	Workmanship in bone and stone degenerated	Harpoon heads flat, with large barbs, in antler. Passage from the Paleolithic period into the Neolithic.
Upper Paleolithic	Magdalenian	Development of work on bone and hard substances	Burins or gravers in flint. Flint blades thin and symmetrical. Development of bone implements and of fine art.
	Solutrean	Flints worked by pressure	Laurel-leaf blades. The skin scraper appears. Apogee of stone implements.
	Aurignacian	Marginal retouching by striking and pressure	Blades of unilateral curvature; tools thinner than those of Mousterian epoch.
Middle Paleolithic	Mousterian	Flints that show retouching (chipped and flaked)	Stone blades to be held in the hand, knives and choppers. Blades wide and thick, and chipped on one face only. Disappearance of the flaked axe (<i>coup de poing</i>).
Transition Paleolithic	Acheulean	Mixed art	Leaf-shape blades, <i>langues de chat</i> , narrower, thinner, more delicate, and carefully finished.
Lower Paleolithic	Chellean	Made by direct blows	Only one stone implement, the <i>coup de poing</i> , large, coarse, with large facets on each side.

with Neolithic tools of the rest of Europe. There were even, until quite recently, tribes in Russia who were still in this grade of progress.

These ancient Neolithic peoples were sedentary and industrial. Their food was not obtained wholly by natural processes, but artificialism in the cultivation of the soil and the domestication of animals progressed. Their homes were no

longer movable tents, but substantial buildings. They constructed the pile dwellings of Switzerland, France, Italy, and perhaps of Ireland. They buried their dead under dolmens, and it was they who set up huge megalithic monuments in England, Brittany, and Spain.

The Neolithic peoples of the British Isles, as well as of other parts of western Europe, were

quite long-headed, the ratio of the length to the width of the skull being as low as 65-75. These earliest of European industrial peoples had also long faces like some existing populations of Europe. It must be carefully noted at this point that in Sweden, France, Switzerland, Germany, Austria, Spain, and Portugal crania of short-headed peoples are found mixed with dolichocephalic skulls. This tells an important story, for it clearly shows that with progress race mixture had begun to take place, the borrowing of blood being associated with the community of arts. Another fact worthy of notice is that the erection of huge stone and earth monuments, called barrows by ethnologists, indicates the consolidation of society, implying an increasing number of persons who could be brought together in the same enterprise, and the consequent raising of an artificial food supply so that these masses might coöperate for longer periods of time.

The so-called ages of Metal in Europe, i.e., of Copper, Bronze, and Iron, comprise the remaining epochs in the popular scheme of European archaeology. In America the earliest implements in copper were cold-hammered and ground into shape, the material being treated technically precisely as if it were stone. It is not surprising, therefore, to find the same condition of things in Europe. The parallelism is almost perfect in every respect. Copper tools and weapons do not mark a separate epoch, meaning that the stone implements ceased to be used at once, nor must it be inferred that there was a Copper age as distinguished from a Bronze age, for copper tools and weapons are found associated with bronze relics. And here arises one of the most interesting inquiries of all, how far the exquisite products in bronze, found all over Europe, are results of indigenous development, and how far they indicate commerce or instruction from without. There is no doubt that both of these factors coöperated, the result of which was the art as it existed in each region.

It is a well-known law of progress that suggestion is one of the strongest incentives to the use of materials and processes. There existed in central and western Europe a Bronze age, which in some characteristics of its products resembles the Orient and in others is entirely original. The art of bronze smelting and working could not arise originally and develop completely and independently in any land; and secondly, such an art could not be imposed bodily upon a people who were not far enough advanced to add to it many thoughts and technical processes of their own. Progress and complexity in artificial activities are produced by the mutual influence of races and peoples. In proof of this the Bronze age witnessed the coming of a great variety of physical types. In England the people became more brachycephalic, the ratio of head length to head width being 81. In Sweden and Denmark long-headed people, tall and fair-haired, coexisted with those of much larger index. In the valley of the Rhine, as well as in southern Germany and Switzerland, the dolichocephaly was more pronounced. Knowledge of the use of fire among the peoples of the Bronze age was contemporaneous also with the cremation of the dead.

The earliest relics of the Iron age are found in the hamlet of Hallstatt, in Upper Austria, in thousands of graves, revealing implements of industry, weapons, and personal ornaments,

but no pottery. At first it seemed to have had no affiliation with any other national art, but later researches put the earliest Iron age as a medium between the more advanced art of southern Europe and the West. Iron gradually replaced bronze, which had then passed into its æsthetic stage, and revealed the existence of Oriental influence in Europe. The long heads also became mingled with short heads, and in the La Tène, also called Marnean, epoch, skulls vary almost as much as at the present day. Von Luschan is of opinion that all the brachycephalic Europeans (Alpine race) are genetically related with the Hittites of western Asia, and holds that there were successive immigrations of short-headed peoples, the most recent and historically best-established one being that of the Magyars. On the other hand, Schliz inclines to the theory of a European origin of the brachycephalous skulls found in Europe.

The types of races mentioned extend far beyond the boundaries of Europe into Asia and Africa. The lines between the continents are entirely artificial.

Ripley finds three separate biological races of men in Europe:

1. **TEUTONIC RACE.** Dolichocephalic of Kollmann; Reihengraber of German writers; Germanic of English; Kymric of French; Nordic of Deniker; and *Homo europæus* of Lapouge.
2. **ALPINE RACE** (or Celtic). Celto-Slavic of French writers, Sarmatian of Von Holder; Disentis of German writers; Arvernian of Beddoe; Occidental of Deniker; *Homo Alpinus* of Lapouge, and Lappanoid of Pruner-Bey.
3. **MEDITERRANEAN RACE.** Iberian of English writers; Ligurian of Italian writers; Ibero-Insular and Atlanto-Mediterranean of Deniker.

RACE	HEAD	FACE	HAIR	EYES	STATURE	NOSE
1 Teu- tonic	Long	Long	Very light	Blue	Tall	Narrow, aquiline
2 Alpine (Celtic)	Round	Broad	Light chest- nut	Hazel- gray	Medi- um, stocky	Variable broad, heavy
3 Mediterranean	Long	Long	Dark brown or black	Dark	Medi- um, slender	Rather broad

Inquiry into the causes of difference in stature, head form, and color, leads to the profoundest of biological studies. To say that inheritance and variation are sufficient to account for them is to explain nothing. Even stature is not always a matter of nutrition. Much controversy has arisen over the origin of blondness in northern Europe. No doubt, albinism is more pronounced in Europe. Its marked appearance elsewhere is among the kindred peoples in northern Africa and southeastern Asia. The popular notion that exposure to the action of the sun's rays is the cause of brunetness is altogether erroneous. No single known cause produces either albinism or brunetness. It is quite probable that long ago the subspecies to which Europeans belong were yellow or Mongoloid in color, and that by the coöperation of environment and obscure physiological processes these characteristics became fixed and persistent through heredity.

Having fixed these three biological types in mind, the difficulty is in finding their representatives in modern Europe. Race is a matter of blood kinship, requiring isolation under favorable conditions for bringing about new character-

THE WHITE RACES OF EUROPE

HELLENIC FAMILY - A GREEK

SLAVIC FAMILY - A RUSSIAN

TEUTONIC FAMILY - A GERMAN

HEBREW FAMILY

CELTIC FAMILY - AN IRISHMAN

LATIN FAMILY - AN ITALIAN

istics that become distinguishing and hereditary. These combined marks define race, and are not to be confounded with the term "people."

A people is a collection of human beings living together under a definite nationality and occupying a specific region. It is an elastic term, applying, it may be, to a small community, as the people of a certain valley or plain, but can also include all who are under the sway of a great nationality. In Europe there are the people of France, Belgium, Scandinavia, and Germany; of Italy, Spain, and Portugal; of Switzerland, Tirol, and the Netherlands; of the British Isles, Russia, Turkey, and Greece; and each one of these peoples becomes a problem to be solved with reference to race. No people are of one race, no race is confined to a single people. The entire population of Europe is 425,000,000, and besides the three races already mentioned, which include nearly all of this number, there are a few straggling peoples belonging to other races, such as the Basques, Lapps, Magyars, Semites, and Gypsies.

In the classification just described the races are only ideal types; but one of the latest authors on this subject, Deniker, publishes a scheme of the races of men more after the manner of the naturalists. Passing by the assumption that there may have been formerly a certain small number of typical races out of which all the peoples of Europe have grown, he takes the total population as he would a number of animals, and divides them up on biological characteristics as he finds them, without inquiring into their causes. The nations and peoples now existing in Europe have arisen from mixture in varying proportions of ancient varieties of our species. By abstracting from these millions of individuals certain ones having groups of definite characteristics relating to stature, the form of the head, pigmentation, and other somatic data, Deniker determines the status of each race, giving rise to six principal and four secondary races, leaving out Lapps, Ugrians, Mongolians, and others belonging to Asia.

DENIKER'S SCHEME OF EUROPEAN PEOPLES

I. WAVY BROWN OR BLACK HAIR, DARK EYES

- | | |
|---|---------------------------------|
| 1. <i>Littoral European race</i> —tall stature; elongated, oval face; straight fine nose; mesocephalic. | } Tawny white skin, black hair. |
| 2. <i>Ibero-Insular race</i> —short stature, dolichocephalic. | |
| 3. <i>Western European race</i> —short stature, round face, strongly brachycephalic. | } Dull white skin, brown hair. |
| 4. <i>Adriatic race</i> —tall stature, elongated face, brachycephalic. | |

II. FAIR, WAVY, OR STRAIGHT HAIR, LIGHT EYES

- | | |
|--|-----------------------|
| 5. <i>Northern European race</i> —somewhat wavy hair and reddish; tall stature; dolichocephalic. | } Reddish white skin. |
| 6. <i>Eastern European race</i> —somewhat straight flaxen hair; short stature; sub-brachycephalic. | |

Sergi pushes the study of classifying Europeans still further into the domain of natural history. In his work on the Mediterranean race he emphasizes the obligations which modern Europe owes to ancient peoples, like the Hamites of Egypt and northern Africa, the Semites of southwestern Asia, the early Greeks, Italians, and Iberians, for the foundation of their culture.

Laying aside the biological divisions of European peoples or countries, the concept of speech may be invoked to show what languages they use. At the outset it is affirmed that no people

belong to one language, no language is confined to one people. The following general scheme shows the relationship between nationality and languages in Europe:

INDO-GERMANIC

1. *Celtic group.*
 - a. Gaelic. Irish, Highland Scotch, and Manx.
 - b. Cymric. Welsh, Low Breton, and Cornish (extinct).
2. *Romance group.*
 - a. French, in 18 dialects. The Langue d'Oc and Langue d'Oïl are its two Romance forms.
 - b. Italian, 14 principal dialects.
 - c. Spanish.
 - d. Provençal, 8 dialects.
 - e. Rumanic.
 - f. Portuguese.
 - g. Rumansch or Churwæsch.
3. *Germanic group. Scandinavian branch.*
 - a. Swedish.
 - b. Danish or Danske.
 - c. Icelandic.
4. *Germanic group. Germanic branch.*
 - a. High German.
 - b. English.
 - c. Platt-Deutsch.
 - d. Dutch, with Flemish dialect.
 - e. Frisian.
5. *Slavic group. Eastern branch.*
 - a. Russian, with Ruthenian or Little Russian dialect.
 - b. Bulgarian.
 - c. Servian, with Sloventz or Wend dialect and Croat dialect.
6. *Slavic group. Western branch.*
 - a. Polish.
 - b. Czech or Bohemian.
 - c. Wend, of Brandenburg and Silesia.
7. *Lettic group.*
 - a. Letts.
 - b. Lithuanian, with Shamaite and Prussian Lithuanian dialects.
8. *Hellenic group.*
 - a. Greek.
9. *Illyrian group.*
 - a. Albanian.
10. *Indic group.*
 - a. Gypsy, or Romany, in several dialects.

The dead languages of the family in Europe are: Etruscan (doubtful), Oscan, Umbrian, Latin, and Langue d'Oc and Langue d'Oïl, of the Romance group; Gothic, Anglo-Saxon, Old Saxon, Old Dutch, Old Frisian, and Old Norse, in the Germanic group; Church Slav, Old Bohemian, and Polish, in the Slavic group; Old Prussian in the Lettic group; ancient Greek with its dialects.

TURANIAN OR FINNO-TATAR FAMILY

1. *Finnic group. Tchudic branch.*
 - a. Finnic or Suomic, two dialects.
 - b. Esthonian.
 - c. Tchoud.
 - d. Lapp.
 - e. Voth.
 - f. Livonian.
2. *Finnic group. Permian branch.*
 - a. Votiak.
 - b. Sirian or Sirvanian.
 - c. Permiak, with Bissermian.
3. *Finnic group. Volgaic branch.*
 - a. Tchuvash.
 - b. Mordvin.
 - c. Cheremiss.
4. *Finnic group. Ugric branch.*
 - a. Magyar or Hungarian, with Ssekler dialect.
 - b. Samoyed.
5. *Tataric group.*
 - a. Turkish or Osmanli.

CAUCASIAN FAMILY

1. *Lesghian.*
2. *Circassian*, in 72 dialects.

BASQUE FAMILY

1. *Basque or Euskara* (with Spanish group and French group).

SEMITIC FAMILY

1. *Hebrew.*

Bibliography. Sources of information on the ethnology of Europe are abundant. Ripley compiled, as a supplement to his *Races of Europe*, a bibliography of 2000 titles arranged by authors and by topics. The official publications of anthropological societies pay great attention to literature on all branches of this subject. The principal serials are the *American Anthropologist* (Washington); *Annales de Démographie* (Paris); *Anthropologie* (ib.); *Archiv für Anthropologie* (Brunswick); *Archivio per l'Antropologia* (Florence); *Beiträge zur Anthropologie und Urgeschichte Bayerns* (Munich); *Bulletins de la Société d'Anthropologie de Paris* (Paris); *Centralblatt für Anthropologie, Ethnologie und Urgeschichte* (Munich); *Correspondenz-Blatt der deutschen Gesellschaft für Anthropologie, Ethnologie und Urgeschichte* (Brunswick); *Journal of the Anthropological Institute of Great Britain and Ireland* (London); *Mémoires de la Société d'Anthropologie de Paris* (Paris); *Memoirs Read before the Anthropological Society of London* (London); *Mitteilungen der anthropologischen Gesellschaft in Wien* (Vienna); *Petermanns Mitteilungen aus Justus Perthes geographischer Anstalt* (Gotha); *Revue d'Anthropologie* (Paris); *Revue Mensuelle de l'Ecole d'Anthropologie de Paris* (ib.); *Revue d'Ethnographie* (ib.); *Verhandlungen der Berliner Gesellschaft für Anthropologie*, its organ being the *Zeitschrift für Ethnologie* (Berlin).

The following comprehensive works are more or less devoted to European ethnology: Keane, *Ethnology* (Cambridge, 1896); id., *Man, Past and Present* (ib., 1899); Ripley, *The Races of Europe* (New York, 1899); Deniker, *The Races of Man* (London, 1900); Macnamara, *Origin and Character of the British People* (ib., 1900); G. and A. Mortillet, *Le préhistorique; origine et antiquité de l'homme* (Paris, 1900); Giuseppe Sergi, *La Mediterranean Race* (London, 1901); Übermaier, *Der Mensch der Vorzeit* (Berlin, 1912); Birkner, *Die Rassen und Völker der Menschheit* (ib., 1913). Among recent articles the following are of special interest: Von Luschan, "Beiträge zur Anthropologie von Kreta," *Zeitschrift für Ethnologie*, pp. 307-393 (Berlin, 1913); id., "The Early Inhabitants of Western Asia," *Journal of the Anthropological Institute*, pp. 221-244 (London, 1911).

EUROPEAN CONCERT OF POWERS.

This term is applied to the system of international politics which was actually in vogue from 1815 to 1822 and theoretically after the latter date. The first intimation we have of the idea is to be found in the sixth article of the Treaty of Chaumont signed Nov. 20, 1815, after a quarter century of bloody warfare. It ran as follows: "In order to consolidate the intimate tie which unites the four sovereigns (England, Russia, Austria, and Prussia) for the happiness of the world, the High Contracting Powers have agreed to renew at fixed intervals, either under their own auspices or by their respective ministers, meetings consecrated to great common objects and to the examination of such measures as at each one of these epochs shall be judged most salutary for the peace and prosperity of the nations, and the maintenance of the tranquillity of Europe." The Congress of Aix-la-Chapelle (1818) admitted France to the Concert and apparently the nations were all working in harmony. Soon after a disintegrating trend is noticed. By the protocol of Troppau (1820) Austria, Russia, and Prussia made the

aim of the Concert synonymous with Metternich's reactionary policy. This was particularly displeasing to England and France, which were liberal countries. The final break came when Great Britain refused to become a party to the Congress of Verona, which authorized France to send an army into Spain to quell a constitutional uprising. The attempt to govern Europe by the Concert system failed because the doctrine of nationalism and the modern idea of a "State" promulgated by the French Revolution had finally come into their own on the Continent.

As an outgrowth of the foregoing system, Europe in recent years was divided into two rival alliances. The first the Triple Alliance (q.v.), signed (1882) by Germany, Austria, and Italy, and the second the Triple Entente, signed first by France and Russia (1891-95) and later by France and England (1904). Before the admission of England the former was a far more formidable agreement than the latter. Unquestionably the balance of power of Europe was preserved by these two opposite divisions. Several times previous to the war of 1914 the near Eastern question almost precipitated a far-reaching European conflict. The greatest crisis was in 1908, immediately following the Young Turkish revolution. Austria announced the complete annexation of Bosnia and Herzegovina. The Triple Entente raised a strong protest, but the weak condition of Russia and the mobilization of Germany's wonderful armament on the French and Russian frontiers effectively stopped all argument. The struggle in the Balkans (q.v.) caused the two alliances to be harmonious in one respect at least. England, Germany, France, Russia, and Italy determined that Austria should not expand southward and absorb the entire Balkans, which are her only outlet. They feared a strong Mediterranean power which could be very easily maintained by one nation on that peninsula. The five other members were also determined that Russia should not get control of the Dardanelles, for here again the supremacy of the other nations on the Mediterranean would be seriously threatened by so great an enhancement of Russia's power.

The outbreak of the European crisis in July, 1914, after the declaration of war on Serbia by Austria, put the Concert to a severe test. From the very beginning, disintegrating influences, as well as new alliances, were strikingly apparent. Italy refused to be bound by the Triple Alliance and claimed she would enforce her neutrality by strength of arms if necessary. The *rapprochement* with Austria has always been unpopular with the Italians, and was only entered into because of the fear of French encroachments. The offer of a strip of territory in northern Africa was not tempting enough for her to cast her lot with Germany and thus draw upon herself the strength of the unquestionable masters of the Mediterranean, England and France. Another feature of this situation was the alignment of almost all of the other European nations with the Triple Entente against Germany and Austria. In the Balkans, Serbia, Montenegro, and Greece were actually at war, and Bulgaria threatening to attack Turkey, if she aided Germany. Portugal decided to help Great Britain, and Belgium was fighting Germany to protect her neutrality. Holland and Denmark declared that they would appeal to arms if their territory was violated.

Spain and Italy refused offers of aggrandizement to help the German Emperor, and so he was left along with Austria to struggle against an almost unified Europe. In August, 1914, one phase yet to be worked out was to see whether Russia's treaty obligations would cement her with Great Britain throughout the crisis, or whether she would attempt to realize her desire for the Dardenelles, while Great Britain was engaged with Germany and possibly unable to maintain the integrity of European Turkey. See WAR IN EUROPE.

EU'ROPHEN. An amorphous yellow powder containing 27.6 per cent of iodine, which it sets free under the influence of heat and moisture. Its action is similar to that of iodoform, to which it is preferred on account of its rather aromatic odor. It is insoluble in water, but dissolves freely in alcohol, ether, chloroform, and oils.

EURO'PIUM. A chemical element contained, in exceedingly small quantities, in monazite sand and, as shown by spectrum analysis, in the chromosphere of the sun and in other heavenly bodies. In monazite sand it is associated with a number of other elements of the "rare earth" group, including cerium, lanthanum, neodymium, praseodymium, samarium, gadolinium, and terbium, and a complex series of operations are required to separate it from these, the methods having been worked out by Demarcay, Urbain and Lacombe, and Eberhard. The symbol of europium is Eu; its atomic weight, as determined by Jantsch in 1908, is 152. In its metallic state the element is still unknown. Its oxide, Eu_2O_3 , is obtained in the form of a pinkish powder. Its sulphate, $\text{Eu}_2(\text{SO}_4)_3 + 8\text{H}_2\text{O}$, forms pale-pink crystals, soluble in water.

EUROTAS (Lat., from Gk. *Εὐρώτας*), the modern R. In ancient geography, a river of southern Greece, rising in the southern Arcadian Mountains and flowing in a southerly direction through Laconia, traversing the fertile valley between Mount Malevo and Taygetus, and falling into the Gulf of Laconia. The cities of Sparta and Amyclæ, celebrated in Greek mythology, were situated on the Eurotas.

EUROTIIUM, *û-rô'shî-ûm*. The generic name of one of the most common molds. It appears on bread, preserves, etc., and is commonly known as the herbarium mold. The generic name more frequently used now is *Aspergillus*. See PHYCOMYCETES.

EUR'US (Lat., from Gk. *Εὐρος*). The south-east wind; in later Greek legend, the son of Astræus and Eos.

EURYALE, *û-rî'a-lâ* (Neo-Lat., from Gk. *εὐρύαλος*, *euryalos*, with wide threshing floor, from *εὐρύς*, *eurya*, broad + *ἄλος*, *halôs*, threshing floor). A genus of plants of the family Nymphæacæ, or water lilies, closely allied to *Victoria* (q.v.), although of a very different appearance. *Euryale ferox*, the only species, is a water lily native to India and China, with small red or violet-colored flowers, leaves from 1 to 4 feet in diameter, the leafstalks and calyces covered with stiff prickles. The fruit is round, soft, pulpy, and of the size of a small orange, composed of a number of carpels, and containing round black seeds as large as peas, which are full of starch and are used to thicken soups or are eaten roasted. The rootstock also contains starch, which may be separated and used for food; the root itself is also eaten. The plant, which is said to have been in cultivation in China for

upward of 3000 years, is more hardy than the *Victoria regia* and will endure the temperatures of the latitude of Philadelphia, reproducing itself from self-sown seeds in ponds. The whole plant is formidably spiny, whence its specific name, *ferox*.

EURYBLADES, *û-rî-bî'a-dêz* (Lat., from Gk. *Εὐρυβλάδης*). A Spartan naval hero. He was in command of the Spartan fleet and afterward nominal commander of all the Greek vessels sent out against the Persians in 480 B.C. To him and to Themistocles (q.v.) is credited the Greek victory of Salamis (q.v.).

EU'RYCLÆA (Lat., from Gk. *Εὐρύκλεια*, *Eurykleia*). A slave in the household of Laërtes and the nurse of Odysseus. On his return in the garb of a beggar she recognized him by a scar while washing his feet and secretly reported his return to Penelope. Consult *Odyssey*, xix, 385 ff.

EURYDICE, *û-rî'dî-sê* (Lat., from Gk. *Εὐρυδίκη*, *Eurydikê*). The wife of Orpheus (q.v.). When she died from the bite of a serpent, her husband followed her into the lower world, where he so charmed Hades with the music of his lyre that he was permitted to take Eurydice back to earth on condition that while on his way to the upper world he would not look behind him. Just as he reached the exit he disobeyed, and Eurydice vanished into the darkness. For a beautiful version of the story, consult Vergil, *Georgics*, iv, 453-527. Hermes, Orpheus, and Eurydice are represented on a very beautiful Greek relief of the end of the fifth century B.C., of which copies are in Naples, Paris, and Rome.

EURL'ŌCHUS (Lat., from Gk. *Εὐρύλοχος*). One of the companions of Odysseus. He alone escaped when the others were turned into swine by Circe (q.v.). On the island of Thrinacia he induced his companions to slaughter the cattle of Helios, which resulted in the destruction of all the ships. See ULYSSES.

EURYMACHUS (Lat., from Gk. *Εὐρύμαχος*). The son of Polybus, and one of the boldest of the suitors of Penelope, slain with the other suitors by Odysseus. See ULYSSES.

EURYMÆDON (*Εὐρυμέδων*). An Athenian general in the Peloponnesian War. In 428 B.C. he commanded a fleet at Corcyra. In 427 he ravaged the Territory of Tanagra. In 425 he was appointed, with Sophocles, son of Sostratides, to command an expedition aimed at Sicily. On reaching Sicily, Eurymedon and Sophocles concluded terms of peace with Hermocrates. These terms displeased the Athenians, who charged that the treaty was brought about by bribery; Eurymedon was sentenced to pay a heavy fine. In 414 he was sent to reinforce the Athenians at Syracuse, but was defeated and slain before reaching land.

EURYNOME, *û-rî'n'ô-mê* (Lat., from Gk. *Εὐρυνόμη*). The daughter of Oceanus and mother by Zeus of the Charites, or of Aropus. She was the wife of the Titan Ophion, who ruled Olympus, but with his wife was cast down to Tartarus by Cronus. She had a temple at Phigalia, where her statue—half woman, half fish—was preserved, and where she was popularly identified with Artemis.

EURYPYTERIDA, *û-rîp-têr'î-dâ*. A class of extinct Arachnoidea, related to the horseshoe crab on the one hand and the scorpions on the other. They appear in the Cambrian period, reach their greatest development in the Silurian, and decline in the Devonian and Carboniferous, disappearing with a small form found in the

Permian rocks of Portugal. In the Silurian, before the ascendancy of the fishes, they were the terrors and monsters of the sea and attained a length of 10 feet or more, as in *Pterygotus buffalocensis* of the water-lime beds of New York. These gigantic aquatic arachnids probably originated in the sea, but later flourished in the estuaries and lagoons of the shallow coasts, and finally became adapted to fresh-water conditions. In appearance they are distinctly archaic, especially the type of the class, *Eurypterus*, with its relatively small broad cephalothorax and evenly segmented abdomen; there is resemblance to a primitive crustacean, to which the eurypterids have long been referred. Some are somewhat fishlike in outline (*Hughmilleria*), others with their spreading legs resemble gigantic spiders (*Stylonurus*), and others again are distinctly scorpion-like (*Eusarcus*) by reason of their abruptly set-off tail and curved tail spine.

The body of the eurypterids consists of a broad semicircular or semielliptic cephalothorax which bears on the upper side a pair of faceted or smooth lateral eyes and a pair of ocelli on the apex; on the underside are two prehensile chelicerae in front of the mouth, which in *Pterygotus* grow into immense serrated pincers; and five pairs of legs. The last pair of them in *Pterygotus*, *Eurypterus*, and *Eusarcus* is formed into paddles that served as swimming organs and to anchor the creatures to the mud. The bases of the legs (gnathobases) that surround the mouth are provided with teeth. A large elliptic or oval plate, the metastoma, which corresponds to the chilidia of *Limulus*, is attached posteriorly of the mouth. It is a characteristic organ of the eurypterids. The abdomen consists of 12 segments and a telson; the anterior six segments consist of rather flat dorsal plates (tergites), to which are attached five pairs of broad, leaflike appendages, corresponding to the operculum and branchial appendages of *Limulus*. The operculum bears genital appendages of two different forms which permit the distinction of the sexes. The six posterior segments are annular. The telson is either a long spine or a broad oval rudder, bilobed in *Erettopterus*. The surface is marked by very characteristic scales.

The eurypterids are divided into two families—the Eurypteridae with smooth eyes and small chelicerae (genera *Eurypterus*, *Tylopterus*, *Onichopterus*, *Eusarcus*, *Dolichopterus*, *Drepanopterus*, *Stylonurus*, *Anthracopterus*) and the Pterygotidae with faceted eyes and large chelicerae (*Hughmilleria*, *Pterygotus*, *Erettopterus*, *Stimonius*). Their remains occur in the Ordovician rocks of eastern North America, the Silurian rocks of the United States, the Old Red Sandstone of Scotland, the coal measures of Pennsylvania and Illinois, and the Carboniferous strata of Dakota, Scotland, Brazil, and South Africa. Some paleontologists see in the eurypterids the invertebrate ancestors of the fishes, and thereby of the vertebrates in general. See illustration in article MEROSTOMATA.

Bibliography. Huxley and Salter, "On the Genus *Pterygotus*," *Memoirs of the Geological Survey of the United Kingdom*, vol. i (London, 1859); Hall, *Palaeontology of New York*, vol. xxxix (Albany, 1859); Woodward, *A Monograph of the British Fossil Crustacea of the Order Merostomata* (London, 1866-78); Woods, "Eurypterida," in *The Cambridge Natural History* (Cambridge, 1909); Walcott, "Middle Cam-

brian Merostomata," *Smithsonian Miscellaneous Collections*, vol. xxvii (Washington, 1911); Clarke and Ruedemann, "The Eurypterida of New York," *New York State Museum Memoir*, 14 (Albany, 1912).

EURYPTERUS. See EURYPTERIDA.

EURYPYLUS (Lat., from Gk. Εὐρύπυλος). 1. King of the Merope in Cos, and son of Poseidon and Astypalæa. He was killed by Heracles, with the assistance of Zeus. His daughter Chalciopé became by Heracles the mother of Thessalus. 2. The son of Telephus and Astyoche, sister of Priam. He went to the aid of the Trojans and after heroic deeds was slain by Neoptolemus (q.v.). 3. The son of Eumæon, King of Ormenium, in Thessaly, and one of the suitors of Helen. He went to Troy with 40 ships and received as his share, at the division of the Trojan booty, a chest preserved by Dardanus, which contained an image of Dionysus, the work of Hephestus himself. On opening the box Eurypylus was struck with madness, for the cure of which the Delphic oracle directed him to dedicate the chest where he should find an unknown form of sacrifice. On his return he found at Aroë, in Achaia, an unusual sacrifice to Artemis, consisting of the annual offering of a beautiful youth and maiden. Having abolished this worship, he substituted that of Dionysus Æsymnetes.

EURYSTHENES, ἑ-ρίσ'-the-néz (Lat., from Gk. Εὐρύσθηνος). One of the Heraclidæ, the son of Aristodemus. With his twin brother Procles he received Lacedæmon as his share of the Peloponnesus and ruled at Sparta in conjunction with his brother. Thirty-one kings of Sparta were of his family.

EURYSTHEUS (Lat., from Gk. Εὐρύσθεύς). A king of Mycenæ, to whose power Heracles was subjected by the craft of Hera and forced to undertake the Twelve Labors. Eurystheus was afterward defeated and killed by Hyllus, the son of Heracles. See HERCULES.

EUSEBIAN CANONS. An ancient system of cross reference to the Gospels, found in very many biblical manuscripts. Long before the modern chapter and verse divisions came into use, a number of systems of text division were current. The one most generally used was that of Eusebius, the famous church historian (c.260-340). Either adopting or improving the work of Ammonius, an Alexandrian, Eusebius divided Matthew into 355 sections, Mark into 236, Luke into 342, and John into 232, the so-called Ammonian Sections, the number of each section being written on the margin of the text. On account of similarity of matter, many sections of one Gospel were nearly or quite identical with others in one or more of the other three. For conveniences of reference, Eusebius constructed 10 tables or lists, called canons. The first contained the numbers of all the sections common to all four Gospels arranged in parallel columns. The second, third, and fourth tables gave the sections common to three Gospels. The fifth to the ninth gave those common to two, while the tenth was made up of those contained in but one Gospel.

In manuscripts using the system, underneath each section number was written in red ink the number of the canon in which that section might be found. For example, the first line of canon i contained the section numbers 8, 2, 7, 10—i.e., the eighth section of Matthew contained the same matter as the second of Mark, the seventh

of Luke, and the tenth of John. Hence, on the margin of the text of Matthew, opposite the eighth section, would be the figures (Greek letters being used) $\frac{H}{A} \left(\frac{8}{1} \right)$, indicating that this

section would be found in the first canon, and similarly for all the sections in all the Gospels. This widely used system was doubtless of great convenience in New Testament study. Consult Tischendorf, *Prolegomena* to the eighth edition of his Greek New Testament (Leipzig, 1884), and C. R. Gregory, *The Canon and Text of the New Testament*, pp. 470 ff. (New York, 1907).

EUSEBIUS (Lat., from Gk. Εὐσέβιος) or **CÆSAREA** (c.260-c.340). The father of ecclesiastical history. He was born in Palestine about 260. He took the surname of Pamphili from his friend and teacher, Pamphilus of Cæsarea, whose great library furnished much of the extensive historical sources Eusebius later used. Pamphilus ultimately met a martyr's death, and Eusebius had to flee for his life. He went to Egypt and was imprisoned there. In 313 he succeeded Agapius as Bishop of Cæsarea. At the Council of Nicæa (325) Eusebius made the opening address and was the leader of the semi-Arian or moderate party, who were averse to discussing the nature of the Trinity and preferred the simplicity of Scripture language to the metaphysical distinctions of either side. He was present at the synods of Antioch (330) and Tyre (335) and showed marked Arian leanings, though at Nicæa he had felt constrained to accept the Athanasian position. He stood in high favor with Constantine, who, it is said, declared that he was fit to be the bishop of almost the whole world. He died at Cæsarea about 340. Eusebius has the reputation of being the most learned of the Church fathers after Origen, though without his genius. His chief works are: 1. The *Chronicon*, a history of the world down to the celebration of Constantine's *Vicennalia* at Nicomedia and Rome in 327-328. It is particularly valuable for its extracts from old writers. 2. The *Præparatio Evangelica*, in 15 books, a collection of extracts from heathen authors fitted to prepare the way for Christianity. 3. The *Demonstratio Evangelica*, in 20 books, a work intended to convince the Jews of the truth of Christianity from the evidence of their own Scriptures. 4. The *Historia Ecclesiastica*, in 10 books, relating the principal occurrences in the Christian Church to the year 324. Unfortunately Eusebius omits everything derogatory to Christians, considering such matter not edifying. Eusebius' complete works are in Migne, *Patrologia Græca*, xix-xxiv. The *Præparatio* and *Demonstratio* were edited by Dindorf (Leipzig, 1867-71); the *Ecclesiastical History*, *Life of Constantine*, and *Oration in Eulogy of Constantine* by Heinichen (ib., 1868-70); the *Chronicon* by Schöne (Berlin, 1866-75). A critical edition of his works appears in the series *Griechische christliche Schriftsteller der ersten drei Jahrhunderte* (Leipzig, 1902-03). The *Præparatio Evangelica*, with translation, was published by Gifford (Oxford, 1903). There is an English translation of the *History*, by A. C. McGiffert, in the *Nicene and Post-Nicene Fathers* (2d series, New York, 1890), with prolegomena and elaborate notes. Translations of some of the minor works also appear in the same volume. Consult Schöne, *Die Weltchronik des Eusebius in ihrer Bearbeitung durch Hieronymus* (Berlin, 1900),

and for a critical discussion of the text of the *Martyrs*, Violet (Leipzig, 1896) and Harnack (Essen, 1898). Consult also Harnack, *Geschichte der altchristliche Literatur* (Leipzig, 1893).

EUSEBIUS OF EMESA (c.300-359). A Semi-Arian bishop. He was born at Edassa, about 300. He was a pupil of Eusebius of Cæsarea and also studied at Alexandria. Averse to theological controversy, he declined the bishopric of Alexandria after the deposition of Athanasius. Later, however, he was appointed Bishop of Emesa (the modern Homs) and filled the post, notwithstanding opposition, sometimes violent, on account of his semi-Arian sympathies. He was also accused of Sabellianism, and his astronomical knowledge made him suspected of sorcery. (See **SABELLIUS**.) He was a favorite of the Emperor Constantius, accompanied him on his expedition against the Persians in 338, and spent much of his time thereafter in attendance upon the Emperor. He died at Antioch in 359. His reputed works are in Migne, *Patrologia Græca*, lxxxvi, and his homilies were published by Augusti (Elberfeld, 1829). Many of these are undoubtedly spurious. Consult Thilo, *Ueber die Schriften des Eusebius von Alexandrien und des Eusebius von Emesa* (Halle, 1859).

EUSEBIUS OF NICOMEDIA (?-342). An Arian leader, Patriarch of Constantinople. He was born towards the close of the third century and was related to the Imperial family. He was educated in the schools of Antioch, Arius (q.v.) being a fellow pupil. He became Bishop of Berytus (Beirut), in Syria, and later of Nicomedia. At the Council of Nicæa he appeared as a defender of Arius, and, like his namesake of Cæsarea, advocated compromise. Later he placed himself at the head of the Arian party. In 339 he was made Patriarch of Constantinople. In 341 he held an assembly of the Church at Antioch, for the purpose of establishing Arianism. He died soon after, in either that year or the following. Eusebius is said to have been ambitious and avaricious, and unscrupulous in the means adopted to secure his ends. It must be borne in mind, however, that no writings of the Arian party are preserved, and all our knowledge is from their opponents, the orthodox party. The Arians are sometimes called Eusebians.

EUSEBIUS EMMERAN. See **DAUMER**, **GEORG FRIEDRICH**.

EUSKALDUN, ū'skál-dūn'. See **BASQUE**.

EUSKIRCHEN, ois'kír-ken. A town and railway junction, capital of a circle in the Rhine Province, Prussia, 15 miles west of Bonn (Map: German Empire, B 3). It is a thriving industrial centre; manufactures cloth, sugar, white lead, hosiery, leather goods, furniture, art objects, machinery, pottery, malt, beer, brandy, flour, and meal. Pop., 1900, 10,285; 1910, 12,413.

EUSPORANGIATES, ū'spō-rán'jī-āts. A name given to those groups of plants whose sporangia originate beneath the surface of the body rather than from the surface. They include the seed plants and also all of the Pteridophytes excepting the common ferns.

EUSTACHIAN (ŭ-stā'kī-an) **TUBE**. See **EAR**.

EUSTACHIO, ā-ōōs-tā'kē-ō, **BARTOLOMEO** (?-1574). An Italian anatomist, born in the early part of the sixteenth century. His birth-

place is not known with certainty. In 1562 he was professor of medicine in the Collegio della Sapienza at Rome. His name is indelibly associated with anatomical science, through his description of the Eustachian tube (see EAR) and the rudimentary valve in the heart, which are named after him. He was the first to give an accurate description of the thoracic duct and was probably the first to notice and describe the stapes (one of the chain of small bones crossing the tympanic cavity of the ear)—a discovery which, however, Fallopius assigns to Ingrassias. He likewise contributed materially to the diffusion of more accurate knowledge regarding the development and evolution of the teeth and the structure of the kidney. These discoveries are recorded in his *Opuscula Anatomica*, published at Venice in 1563. The *Tabulae Anatomicae* did not appear until 1714, when they were edited, with explanatory remarks, by Lancisi. Eustachio, Vesalius, and Fallopius may be regarded as the founders of modern anatomy. See ANATOMY.

EUSTACHIUS, ū-stā'ki-ūs, or **EUSTATHIUS**. A Roman saint and martyr of the second century. According to the legend, his name was Placidus. The legend adds that he was converted, while engaged in the chase, by suddenly beholding between the antlers of a deer a vision of Christ, which thus addressed him: "Why dost thou follow me, who desire thy salvation?" He suffered martyrdom in Rome under Hadrian and is regarded by the Roman Catholic church as the patron of the chase. His day is September 20.

EUSTATHIUS (Lat., from Gk. Εὐστάθιος) or **ANTIOCH** (?-c.340). A bishop of Antioch, born at Side, Pamphylia. At the Council of Nicæa he was exceedingly hostile to the Arians, in consequence of which he was deposed (331) upon their accession to power. He was subsequently banished to Illyria, and finally to Thrace, where he died. Of his numerous writings only a work against Origen and a few fragments of other volumes remain.

EUSTATHIUS (c.300-c.380). A Semi-Arian bishop of Sebaste, in Armenia, into which country he introduced monasticism. The ascetics and celibates known as Eustathians are supposed to have derived their name and their religious practices from him. They were condemned in 340 by the Synod of Gangra. He was also the founder of a hospital for the poor at Sebaste, which he placed in charge of his friend Ærius. Although constantly attacked by the orthodox churchmen, he retained his see, through the friendship of Constantine. He was deposed in 358 by the Synod of Melitene. Consult Loofs, *Eustathius von Sebaste* (Halle, 1898).

EUSTATHIUS. A celebrated Byzantine commentator on Homer, on the geographical epic of Dionysius the Periegete, and on Pindar. He was born probably at Constantinople in the early part of the twelfth century; became a monk, later a deacon in the church of St. Sophia, and in 1175 was appointed Archbishop of Thessalonica, where he died between 1192 and 1194. He is best known for his great commentary on the *Iliad* and the *Odyssey*, which, in spite of its diffuseness and digressions, is a valuable treasure house of ancient learning; but since the discovery and publication of the Homeric Scholia its importance has been much diminished. His chief sources were the extant

Homeric Scholia, rhetorical lexica, Suidas, the Etymologicum Magnum, Athenæus, Ælius Dionysius, Aristophanes of Byzantium, Pausanias, Stephanus of Byzantium, Suetonius, and Heracleides of Miletus. The commentary was first published in Rome in 1542; it was last edited by Stallbaum (7 vols., Leipzig, 1825-30). The paraphrase and commentary to *Dionysius the Periegete* is of little value, except for what it preserves of Stephanus of Byzantium and of lost writings by Arrianus. It is best published by Bernhardt, in his edition of *Dionysius* (Leipzig, 1828). Of the commentary to Pindar only the introduction is preserved. This contains a life of Pindar, and a discussion of lyric poetry and of the Olympic Games. It was edited with commentary by Schneidewin (Göttingen, 1837). Eustathius also left a considerable number of historical writings, speeches, and tracts, important for a knowledge of his times, and of the inner history of the Greek monasteries in the twelfth century. Of these the greater part are published in Migne, *Patrologia Græca*, vols. cxxxv and cxxxvi. Consult Krumbacher, *Byzantinische Literaturgeschichte* (Munich, 1897), and Cohn, the article "Eustathios, 18," in Pauly-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, vol. vi (Stuttgart, 1909).

EUSTATHIUS, or **EUMATHIUS**, also known as **MAKREMBOLITES**. A Byzantine erotic writer or novelist of the twelfth century A.D. He seems to have been a native of Parembolæ in Egypt and is referred to in the manuscripts of his work as chief keeper of the archives there. The novel by him is probably the latest Greek production of its kind known. It consists of 11 books and is a story of the love of Hysminias and Hysmine (published in the *Scriptores Erotici* of Le Bas, Paris, 1856; also by Hercher, Leipzig, 1859, and by Hilberg, Vienna, 1876). The style of the novel is somewhat artificial, and the story decidedly improbable and of a very sensual character. Consult Rohde, *Der griechische Roman* (2d ed., Leipzig, 1900).

EUSTATIUS (ŭ-stā'shī-ūs) **ISLAND**, or **ST. EUSTACHE ISLAND** (Statia). One of the Lesser Antilles, lying northwest of St. Christopher, a Dutch dependency of the island of Curaçao (Map: West Indies, G 3). The chief town is Orangetown. It has an area of 7 square miles and a population (1902) of 1484.

EUSTIS, JAMES BIDDLE (1834-99). An American lawyer and legislator. He was born in New Orleans, graduated at the Harvard Law School in 1854, and was admitted to the New Orleans bar in 1856. During the Civil War he served in the Confederate army as judge advocate on the staffs of Generals Magruder and Johnston and afterward was one of the commissioners sent by Louisiana to confer with President Johnson with regard to the "reconstruction" of that State. He served for several terms in the State Legislature and was afterward twice sent to the United States Senate, serving from 1877 to 1879 and again from 1885 to 1891. From 1879 to 1884 he was professor of civil law in the University of Louisiana and from 1893 to 1897, after his second term in the Senate, was United States Minister and first United States Ambassador to France. After returning in 1897 he practiced law in New York until his death.

EUSTIS, WILLIAM (1753-1825). An American physician and politician. He was born at

Cambridge, Mass., graduated at Harvard in 1772, studied medicine with Joseph Warren, and served as a surgeon in the Revolutionary army. He served in the Massachusetts Legislature and Governor's Council and two terms (1801-05) in Congress as a Democrat, was Secretary of War in President Madison's cabinet from 1809 to 1813, and was Minister to Holland from 1814 to 1818. On his return he was again a member of Congress from 1820 to 1823 and from 1823 until his death was Governor of Massachusetts.

EUTAW. A town and the county seat of Greene Co., Ala., 90 miles west-southwest of Birmingham, on the Alabama Great Southern Railroad (Map: Alabama, B 3). It has an oil mill, ginneries, a lumber mill, and a cotton compress. Eutaw, established in 1838, was named in honor of General Greene's victory at Eutaw Springs in the Revolution. Pop., 1900, 884; 1910, 1001.

EUTAW SPRINGS, BATTLE OF. A battle of the American Revolution, fought on Sept. 8, 1781, about 60 miles northwest of Charleston, S. C., between about 2000 Americans under General Greene and about 2300 British under General Stuart. The battle consisted of two engagements, in the first of which, beginning at about 4 A.M., Greene was victorious; while in the second the British, having rallied, beat off all further attacks. During the night, however, Stuart retreated towards Charleston, and Greene slowly pursued. The battle, though tactically drawn, was an important strategic victory for the Americans, closing, as it did, Greene's famous campaign and compelling the British to shut themselves up in Charleston. The British lost in killed, wounded, and missing about 800 men, the Americans about 535.

EUTERPE, ū-tēr'pē (Lat., from Gk. Εὐτέρπη, very delightful, from εὖ, *eu*, well + τέρπειν, *terpein*, to delight). One of the nine Muses, the daughter of Zeus and Mnemosyne. In the specialization of the functions of the Muses, which occurred in later times, Euterpe was made guardian of flute playing and was represented as holding a flute.

EUTHANASIA, ū-thā-nā'zhī-ā (Neo-Lat., from Gk. εὐθανασία, easy death, from εὖ, *eu*, well + θάνατος, *thanatos*, death, from θάειν, *thanein*, to be dead). An easy death, or a painless method of putting to death. The use of narcotics or other means for shortening life, in disease, has become a subject of discussion in civilized countries; and it is often a very practical question as to how far such means are admissible for soothing the last hours of life, when the approach of death does not of itself dull the consciousness and the sensibility to pain. It must be decided according to all the surrounding circumstances, medical and otherwise, in each individual case. The law, medical ethics, and religious teaching alike condemn euthanasia. The law stigmatizes deliberate putting to death or aiding in the same as murder, and physicians know that apparently doomed patients often recover.

EUTHERIA. A subclass of the Mammalia, embracing all mammals except the monotremes (*Prototheria*). This subclass is characterized by being viviparous, with a small ovum and an allantoic placenta, and by having teats. Whether certain of the most primitive fossil remains, more or less doubtfully attributed to the Mammalia, are to be placed here or among the *Prototheria*, is still a subject of inquiry. Consult Beddard,

"Mammalia," in *Cambridge Natural History*, vol. x (London, 1902). It is unfortunate that, in addition to the above use of *Eutheria* by Gill, Osborn, and Beddard, the same word was used by Huxley, as including the *Placentalia* alone; and this usage is widely disseminated through the literature of the subject. The term *Theria* has recently been used by several authors (Parker and Haswell, and Gregory) as the equivalent of Gill's *Eutheria*. Consult Gregory, "The Orders of Mammals," *Bulletin American Museum of Natural History*, vol. xxvii (New York, 1910).

EUTHYMIUS (Lat., from Gk. Εὐθύμιος), Slav. *Evthimii* (?-c.1393). A Bulgarian patriarch and religious writer, pupil of the Patriarch Theodosius. He lived for some time as a monk on Mount Athos, but, having incurred the enmity of the Byzantine Emperor John V Palaeologus, he withdrew to the vicinity of Trnovo (Tirnov), the capital of the second Bulgarian Empire and seat of the Bulgarian Patriarch. There he led a saintly life, revising the Slavic service books and directing the monks who flocked around him. About 1375 he was elected Patriarch. From his see he preached against the Bogomiles and other heretics. Nothing is known of his life after the taking of Trnovo by the Turks. His original works include lives of saints, eulogies of prominent churchmen, and pastoral epistles. All his writings evince an overwhelming Byzantine influence, which manifests itself not only in his style and ideas, but also in his syntax and orthography. To his Slavic contemporaries this seemed a happy innovation, and Euthymius became the head of a religious literary school which for a long time held sway over Bulgaria, Servia, Russia, and Rumania.

EUTHYMIUS (Lat., from Gk. Εὐθύμιος) **ZYGADENUS** (?-c.1118). A Greek monk and scholar, highly esteemed by the Emperor Alexis Comnenus. He wrote some very dry theological works; the principal one of these is an enumeration of all the heresies from Simon the Magician to his own time—Πανοπλία Δογματικῆ (first Latin edition in 1555; there was an imperfect Greek edition in 1711). His works were printed in Migne, *Patrologia Græca*, vols. cxxviii and cxxxi (Paris, 1864).

EUTING, ōi'ting, JULIUS (1839-1912). A German Orientalist and epigraphist. He was born at Stuttgart and studied theology and Oriental languages at Tübingen, Paris, London, and Oxford. In 1871 he was appointed chief librarian at the Imperial University and Government Library at Strassburg and in 1900 director of that institution. He retired in 1900. As a result of his travels in Europe and the Orient, he accumulated a vast number of ancient Semitic inscriptions, which he gave to the University of Strassburg. His publications include: *Sechs Phönikische Inschriften aus Idalion* (1875); *Beschreibung der Stadt Strassburg und des Münsters* (1881; 15th ed., 1909); *Nabatäische Inschriften aus Arabien* (1885); *Sinaitische Inschriften* (1891); *Tagebuch einer Reise in Inner-Arabien* (1896); *Mandaischer Diwan* (1904).

EUTROPIUS. A Latin historian, concerning whom we know only that he filled the office of secretary to the Emperor Constantine, at Constantinople, fought under Julian against the Persians (363), and was still alive in the reign of Valens (364-378). The date of his death is unknown. His *Breviarium ab Urbe Condita*.

giving a short narrative of Roman history from the foundation of the city to the time of the Emperor Valens, is written in an extremely simple and pure style and appears to have been originally intended for the use of schools. It rests on good authorities. An edition, with enlargements, however, was published by Paul, son of Warnefrid and Theodolinda, generally known as Paulus Diaconus (q.v.). Others continued it down to the year 813. At the revival of letters the history existed in three distinct forms. There was first the genuine work of Eutropius, in 10 books; second, the expanded edition of Paul; and third, a very complete but also interpolated copy in the *Historia Miscella*. The *editio princeps*, printed at Rome in 1471, was from the text of Paul. The best modern editions are those of Droysen (Berlin, 1879) and Ruchl (Leipzig, 1887). There is an edition with English notes, by Hazzard (New York, 1898). A Greek version of the *Breviarium*, by Pænius, is extant and is to be found in Droysen's book. Consult Teuffel, *Geschichte der römischen Literatur*, by Kroll and Skutsch, vol. iii (6th ed., Leipzig, 1913).

EUTROPIUS (?-399). High Chamberlain of the Emperor Arcadius. He was a eunuch and came originally from Armenia. He subsequently became attached to the Imperial court and gained the favor of his master by bringing about the marriage of the latter with Eudoxia, by whom he was installed as the successor of the Minister Rufinus (395). He was the chief adviser of Arcadius and became notorious for his cruelty and avarice. In 397 he procured the enactment of the law of Arcadius against treason (intended to guard against a popular uprising, and later embodied in the codes of Theodosius and Justinian), which provided that in case of high treason even the children of the accused were to be punished. He was deposed in 399, exiled to the island of Cyprus, and subsequently beheaded. Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

EUTYCHES, ū'ti-kéz (Lat., from Gk. Εὐρύχης). A monk of the fifth century, archimandrite of a cloister near Constantinople, who in his old age taught views respecting the nature of Christ which were condemned as heretical. He possessed little education, but was fond of doctrinal controversy, in which the whole Church at that time was engaged. His peculiar teaching was a development of the Alexandrian Christology. He held that two natures, one divine and one human, went to make up the person of Christ, but that after their union in the incarnation there was only one nature, so that Christ was "from" two natures, but not "of" two natures. He was unwilling even to admit that Christ's physical body was like that of ordinary men. Thus his theory tended to dissolve the true humanity in the divinity of Christ.

At a synod held at Constantinople in 448, under Flavian, Bishop of Constantinople, Eutyches was charged with heresy by Eusebius of Dorylæum and condemned. Under Alexandrian influence the Emperor was persuaded to summon a council which should review the case of Eutyches. This council met at Ephesus in 449 and is known as "The Robber Synod" from the riotous character of its proceedings. (See **EPHESUS, COUNCILS OF**.) By the aid of armed soldiers and excited monks Flavian was condemned and Eutyches rehabilitated. But the

Church at large properly refused to recognize as final the verdict of this disgraceful assembly, and a change in emperors made its reversal politically possible. Under Pulcheria and Marcian the Fourth Ecumenical Council was held at Chalcedon (451), and there the doctrine of the two natures in Christ was declared to be an article of the Catholic faith. Eutychianism was again condemned, and Eutyches himself, now 73 years old, was excommunicated and banished. We hear of him for the last time two years later, when he was still in exile. His followers continued their separate existence for a time, having monasteries of their own, but were soon absorbed in the Monophysites (q.v.), who composed a large majority of the Eastern church. See LEO I, and consult: Hefele, *History of the Councils*, iii (Eng. trans., London, 1883); Harnack, *History of Dogma*, vol. iv (Boston, 1899); Du Bose, *The Ecumenical Councils* (New York, 1897).

EUTYCHIANUS, ū-tik'ī-ā'nūs, SAINT. Bishop of Rome, 275-283, reckoned twenty-seventh in the list of the popes. His day is December 8.

EUTYCHIDES (Εὐτυχίδης). A Greek sculptor of the latter part of the fourth century B.C., pupil of Lysippus. He was born at Megara. His most famous work was a statue of Fortune, made for the city of Antioch; it pictured the goddess as wearing a crown of towers and seated on a rock, with the river Orontes at her feet. The work, which was copied for other Asiatic cities, is known through a small copy in the Vatican. It has been suggested that the famous "Victory of Samothrace" is a work of Eutychides.

EUXINE, ūks'īn (Lat. *Euxinus*, from Gk. εὐξείνως, *euxeinós*, hospitable, from *eú*, *eu*, well + *xeivos*, *xeivos*, *xeinos*, *xenos*, stranger). The name applied by the ancients to the Black Sea. It is said to have been called in very early times the *Azenos Pontos*, the *Inhospitable Sea*, by reason of the roughness of its waters and the wildness of the savage tribes that lived on its borders, but to have had its name changed after the Greek colonies were founded in that region. Possibly, however, we are to explain the name *Euxine* as a euphemism for *Azine*. For such euphemistic names, see DURAZZO; EUMENIDES.

E'VA, LITTLE. The friend of Uncle Tom in Mrs. Stowe's *Uncle Tom's Cabin*.

EVAD'NE (Lat., from Gk. Εὐάδνη). The daughter of Iphis, King of Argos, celebrated for her love of her husband Capaneus. Evadne was burned alive on Capaneus' funeral pyre.

EVAG'ORAS (Lat., from Gk. Εὐαγόρας). A king, or despot, of Salamis in Cyprus, a reputed descendant of Teucer. He became King in 410 B.C. and is described by Isocrates in his *Panegyric* as being a just and wise ruler, who aimed to promote the welfare of his people. He cultivated the friendship of the Athenians, and, after the defeat of the Athenians at Ægos-Potami, offered Conon a place of refuge at his court. Being attacked by the Persians, he allied himself with the Athenians and the Egyptians, but was in the end made tributary prince to the Persians. He was assassinated in 374 B.C. and was followed on the throne by his son Nicoteles.

EVA'GRIUS (Lat., from Gk. Εὐάγριος, *Evagrius*) (c.536-?). An early Church historian, surnamed Scholasticus. He was born at Epiphania in Coele-Syria in 536 or 537. He was an advocate at Antioch and the legal adviser of the

Patriarch Gregory. The Emperor Tiberius II made him a quæstor, and Mauritianus, the son of Tiberius, made him prefect. His influence and reputation at Antioch were great, and on the occasion of his second marriage he was given a public festival by the citizens. The date of his death is unknown. Evagrius wrote an *Ecclesiastical History* for the years 431-504, which has value not only for Church history, but also for secular. It forms the last of the continuations of Eusebius' *History*. It is in Migne, *Patrologia Græca*, lxxxvi, and there is an English translation by Hammer (London, 1577, reprinted in Bohn's *Ecclesiastical Library*). The Greek text with the scholia was edited by Bidez and Parmentier (London, 1898). Consult Krumbacher, *Geschichte der Byzantinischen Literatur* (Munich, 1897).

EVALD, a'vald, HERMAN FREDERIK (1821-1908). A Danish novelist. The more noteworthy of his novels are: *Valdemar Krone's Youth* (1860), a story of Danish aristocracy; *The Nordby Family* (1862); *Johannes Falk* (1865); *Charles Lyng* (1882), showing him at his best in the drawing of character; *The Swedes at Kronborg* (1887); *Anna Hardenberg* (1890); *Clara Bille* (1892); *Leonore Kristine* (1895); *Klein Kirsten* (1901); *Bondebrøden* (1904)—all historical novels of merit.

EVALD, JOHANNES (1743-81). The greatest lyric poet of Denmark, born at Copenhagen. His poetry, such as *The Temple of Fortune* (1764), and *Elégies* (1766) on the death of Frederick V, brought him deserved fame, and his biblical drama, *Adam and Eve* (1769), was up to that time the best poem in Danish, as his *Rolf Krake* (1770) was the first original Danish tragedy. His next decade was very productive in tragedy, comedy, and farce, and closed with a drama, *The Fishers* (1779), the noblest of his works, in which, among other lyrics, is the Danish national song "King Christian Stood by the Lofty Mast." Already his health was giving way; the excitement of the first performance of his opera *The Fishers* was too much for him, and he died after some months of agony, cruelly neglected by his family, but solaced by his friends. The best edition of his *Works* is by Liebenberg (8 vols., Copenhagen, 1850-55), the best biographical study his own *Life and Opinions* (Copenhagen, 1792). For his biography, consult also Hammerich (Copenhagen, 1882) and Jørgensen (ib., 1888).

EVAN'DER (Lat., from Gk. Ἐυάνδρος, *Evan-dros*). According to Roman traditions, the son of Hermes by Carmenta or Tiburtis or Themis or Nicostrate. About 60 years before the Trojan War he is said to have led a Pelasgian colony from Pallantion in Arcadia to Italy, and to have landed on the banks of the Tiber, near the foot of the Palatine Hill. From his Arcadian home this settlement was named Pallanteum, or Palatium. Tradition represented Evander as having done much to civilize his neighbors by introducing trades and also knowledge of music and writing. To him is also ascribed the introduction of the worship of the Lycæan Pan, with that of Demeter, Poseidon, and Heracles, though Heracles is also said to have introduced his own worship when entertained by Evander after his battle with Cacus. Vergil represents Evander as being still alive when Æneas arrived in Latium after the sack of Troy; Evander's son Pallas fought for Æneas, but was slain by Turnus. Evander was

worshiped both at Pallantion in Arcadia and at Rome. The story seems clearly devoid of any historical truth and to be merely a late invention to explain some similarities of worship and customs which were thought to exist between Rome and Arcadia. Consult: Schwieger, *Römische Geschichte* (Tübingen, 1867); Preller-Jordan, *Römische Mythologie* (3d ed., Berlin, 1881-83); Wissowa, *Religion und Kultus der Römer* (2d ed., Munich, 1912).

EVANGELICAL (from *evangelic*, Lat. *evangelicus*, Gk. εὐαγγελικός, *euangelikos*, pertaining to the gospel, from εὐαγγέλιον, *euangelion*, gospel, from εὐάγγελος, *euangelos*, bringing good tidings, from εὖ, *eu*, well + ἀγγέλλειν, *angellein*, to announce). Properly, belonging to or based upon the gospel, and hence applied to anything which is marked by the spirit of the gospel of Jesus Christ. In popular use the term is employed by a portion of the Christian community to denote their own peculiar theological opinions, which are held to constitute the only true and complete expression of Christian belief. In general, it implies emphasis on the traditional Protestant theology and upon the element of feeling in religion. In England and Scotland dissenters have claimed to be more "evangelical" than the established churches. In the United States the term is appropriated by the more orthodox sects to distinguish themselves from the liberal bodies. In Germany all Protestants call themselves Evangelical, in opposition to the Catholics. The modern orthodox-pietistic party in the German churches has made exclusive claim to the designation "evangelical" on the ground that they alone hold to the gospel in its actual historic form. In England, after the Methodist revival, those in the Established church who shared in general its spiritual views formed a very numerous party and called themselves evangelical. They formed the great body of the Low Church party.

EVANGELICAL ADVENTISTS. See ADVENTISTS.

EVANGELICAL ALLIANCE. A voluntary association of Evangelical Christians belonging to various denominations and countries. It had its origin in a general and strong desire for a more practical union among Protestants to promote the cultivation of Christian fellowship and the extension of Christian faith. After full conference and correspondence the Alliance was formed in Freemason's Hall, London, Aug. 19-23, 1846, at a meeting of about 800 persons—Episcopalians, Presbyterians, Independents, Methodists, Baptists, Lutherans, Reformed, Moravians, and others representing England, Scotland, Ireland, Germany, France, Switzerland, the United States, and other countries. The following doctrinal articles were adopted, not as a binding creed, but as an expression of the substance of the gospel: 1. The divine inspiration, authority, and sufficiency of the Holy Scriptures. 2. The right and duty of private judgment in the interpretation of the Holy Scriptures. 3. The unity of the Godhead and the Trinity of the persons therein. 4. The utter depravity of human nature in consequence of the fall. 5. The incarnation of the Son of God, His work of atonement for sinners, and His mediatorial intercession and reign. 6. The justification of the sinner by faith alone. 7. The work of the Holy Spirit in conversion and sanctification. 8. The immortality of the soul, the resurrection of the

body, the judgment of the world by our Lord Jesus Christ, with the eternal blessedness of the righteous and the eternal punishment of the wicked. 9. The divine institution of the Christian ministry and the obligation and perpetuity of the ordinances of baptism and the Lord's Supper. The organization thus commenced has since been extended throughout Protestant Christendom. Branch alliances have been formed in Great Britain, Germany, France, Switzerland, Sweden, the United States, Australia, and among missionaries in Turkey, India, Brazil, and Japan. The American branch was organized in 1807. These national branches are related to each other as members of a confederation having equal rights. The whole Alliance appears in active operation only when it meets in general conferences having the character of Protestant ecumenical councils, but claiming only moral and spiritual power. These have been held at London, 1851; Paris, 1855; Berlin, 1857; Geneva, 1861; Amsterdam, 1867; New York, 1873; Basel, 1879; Copenhagen, 1885; Florence, 1891; London, 1896 (celebration of the jubilee); London, 1907. The United States branch held a national conference at Chicago in October, 1893. One of the most effective of the general conferences was that at New York in 1873. The visible results of the Evangelical Alliance may be seen, in part, in its promotion of religious liberty wherever that has been restricted or assailed. Since its organization several cases of persecution have occurred in southern Europe under the operation of penal laws against Protestants. In these cases the influence of the Alliance has been successfully exerted to bring the persecution to an end. It has aided in bringing about changes in favor of religious liberty in Turkey, Sweden, the Baltic provinces of Russia, and Japan. Consult *Reports of the conferences* and Arnold, *History of the Evangelical Alliance* (London, 1897).

EVANGELICAL ASSOCIATION. A religious denomination formed originally among the Germans of Pennsylvania. It has grown and extended till it is represented in most parts of the United States and Canada and has gained a solid footing in Germany and Switzerland. Its founder, Jacob Albright, was born in Pennsylvania in 1759 and was a member of the Methodist Episcopal church. Observing the low condition of religious life among the German population around him, he undertook a work of reformation among them about 1790 and traveled as an evangelist. In 1800 he formed a class or society of his converts, which by 1807 had become large enough to make some organization desirable, and a conference was held at which Albright was unanimously elected Bishop. He died in 1808, leaving the association a growing body of much vigor. A book of discipline was published similar to that of the Methodist Episcopal church, and the name Evangelical Association of North America was adopted. Annual conferences were formed, and the first General Conference, consisting of all the elders, was held in 1816 in Union Co., Pa.

The doctrines and theology of the Evangelical Association are Arminian, and its 21 articles of religion do not differ in any essential point from the 25 articles of the Methodist Episcopal church. Its government, polity, and methods of worship likewise closely resemble those of the Methodist church, and it is represented in

the Methodist ecumenical conferences. It has bishops, chosen by the General Conference for terms of four years; presiding elders, serving not more than four years consecutively in the same districts; classes, quarterly conferences, annual conferences, and the General Conference, the supreme judicatory, meeting every four years. The ministers are of two orders—deacons and elders—and the itinerant system prevails, the pastors being appointed to their stations from year to year, at the meetings of the annual conferences. In 1891 the church suffered a division, the culmination of a controversy of several years' duration. Two bodies met, one at Indianapolis and the other at Philadelphia, each claiming to be the true and lawful General Conference and regarding the other as spurious. Lawsuits resulted concerning titles to property, the final decision of which was given in favor of the party representing the majority, whose General Conference had been held at Indianapolis. The minority then withdrew and organized the United Evangelical church. By this division the Evangelical Association lost about 40,000 members. In 1891, previous to the division, it had 26 annual conferences, 1227 itinerant and 619 local preachers, 150,334 church members, church buildings valued at \$5,168,210, and a missionary income for the preceding year of \$159,443. In 1913 it had 26 annual conferences, including two in Germany and one in Switzerland; 1644 churches, 111,702 communicants, about 190,000 pupils in Sunday schools, church property valued at about \$10,500,000, and a total income for missions of about \$1,000,000. Besides its German elements, it has a relatively large English-speaking membership and publishes English periodicals and English books. It has four bishops, a well-equipped publishing house at Cleveland, and another at Stuttgart, Württemberg; a biblical institute and Northwestern College at Naperville, Ill.; two seminaries; an orphan home at Flat Rock, Ohio; a charitable society; a missionary society, sustaining domestic missions and foreign missions in Japan and China, and assisting the European churches; a Woman's Missionary Society; a Church Extension Society; a Sunday-School and Tract Union; and a Young People's Alliance. Hospitals are maintained in various cities in Germany and in Chicago, and in Bismarck, N. Dak. Its periodicals are: *The Evangelical Messenger* (weekly); *The Missionary Messenger* (monthly); *Der Christliche Botschafter* (weekly); *Der Evangelische Missionsbote* (monthly); papers for Sunday schools and the young people, in English and German—all published at Cleveland; *Der Evangelische Botschafter* (weekly); and *Der Evangelische Kinderfreund* (weekly), published at Stuttgart, Württemberg. Consult: Plitt, *Die Albrechtsleute* (Erlangen, 1877); W. Orwig, *History of the Evangelical Association* (Cleveland, 1858); Mrs. H. Bennett, *History of the Woman's Missionary Society of the Evangelical Association* (ib., 1902); Carroll, *Religious Forces of the United States* (rev. ed., New York, 1912).

EVANGELICAL BODY. See CORPUS CATHOLICORUM.

EVANGELICAL CHURCH CONFERENCE (Ger. *Evangelische Kirchenkonferenz*). See EISENACH CHURCH CONFERENCE.

EVANGELICAL CHURCH, THE UNITED. See UNITED EVANGELICAL CHURCH.

EVANGELICAL COUNSELS, or COUNSELS

OF PERFECTION. A term signifying, among Roman Catholics, the recommendation of certain things which are not universally necessary to salvation, but which those who wish to attain perfection are advised to practice. The most important are those which form the basis of the monastic vows of poverty, chastity, and obedience. A basis is found for them in certain words of Christ, as Matt. xix. 16 ff.

EVANGELICAL UNION. The name assumed by a religious body constituted in Scotland in 1843 by the Rev. James Morison (q.v.), of Kilmarnock, and three other ministers, who had been separated from the United Secession church for doctrinal views, of which the fundamental and determining article was the strict universality of the Saviour's atonement. They were soon joined by a number of ministers and churches of the Congregational Union of Scotland and extended themselves considerably in Scotland and the north of England, having 93 churches in 1889. In 1896 nearly all the churches were absorbed by the Congregational Union. Their church government is independent, but many congregations have ruling elders. Consult Ferguson, *The History of the Evangelical Union* (Glasgow, 1876), and Adamson, *Life of Dr. James Morison* (London, 1898).

EVANGELINE. An exquisite idyllic poem by Longfellow, deriving its title from its heroine and published in 1847. It is the story of two lovers, Gabriel and Evangeline, who are parted during the deportation of the Acadians by the British in 1755. The lovers vainly seek each other, but are brought together only at Gabriel's deathbed, after many years.

EVANGELIST (Gk. *εὐαγγελιστής*, *euangelistēs*, bringer of good tidings [the gospel], from *εὐαγγελίζεσθαι*, *euangelizesthai*, to preach good tidings [the gospel], from *εὐαγγέλιον*, *euangelion*, good tidings [the gospel]). A term which occurs three times in the New Testament, but is not found in either classical or LXX Greek and has not as yet been discovered in the Papyri. It designates one of the several phases of ministry referred to in Eph. iv. 11 and is associated with the name of one of the workers in the apostolic church (Philip, Acts xxi. 8) and with one of the helpers of the Apostle Paul (Timothy, 2 Tim. iv. 5). The service which it represented was of a missionary character, itinerant rather than local, pioneer rather than supplemental, its purpose being to carry the gospel message to new parts, preparing the way with aggressive work for the more settled and organizing service which should follow, though not necessarily without a local centre for work, as Philip had in Cæsarea and Timothy in Ephesus. Its missionary work was much more restricted than that of the Apostles: in fact, the mention of evangelists in the Ephesian encyclical letter is doubtless because the churches to which it was sent had been established largely, if not wholly, by means of their missionary work, under the direction of the Apostle Paul (cf. Col. ii. 1; iv. 12 f.; Acts xix. 10).

As to whether it represents a distinctive office or merely denotes a peculiar set of functions, there may be discussion. It should be recalled, however, that the original office of the Apostle was one that embraced in itself all the functions necessary for the primitive life of the Church, and that, as the Church grew in the complexity of its life, the Apostles were compelled to delegate to others duties which they themselves had

performed (e.g., Acts vi. 1-4; xiv. 23). It would seem, therefore, that however functional the work of the evangelist may have been at the beginning, the tendency would be, even in the apostolic church, for this work to become confined to men who were best qualified to carry it on and who would thus give themselves wholly to its duties. This would explain the designation of Philip as "the evangelist"; while the exhortation to Timothy to "do the work of an evangelist" would indicate that in his peculiar relations to the Ephesian field he was, as the representative of the Apostle, to assume the office of the evangelist as well as that of the pastor and the teacher. In the earlier established churches the apostolic representatives embraced in their work functions which were later assigned to distinctive sets of workers. (Cf. 1 Thess. v. 12 with Eph. iv. 11 and Phil. i. 1.)

In postapostolic times the work of the evangelist underwent a radical change, losing its missionary character and even its itinerant form. Before this change took place, however, the term began to be used of those who had transmitted in writing the oral message of the good tidings of salvation; so that, as these writings came to be termed *evangelis* (gospels), their writers came to be termed evangelists. This meaning first appeared in the third century and later came to be the distinctive usage of the term. In later liturgical language the term was used to denote the reader of the gospel for the day. Its present reference is, somewhat in its earlier sense, to a preacher of the gospel whose work is given specifically to awakening personal interest in religion and who is not permanently connected with any local field, nor devoted to the usual service of the pastorate. Consult: Zückler, "Diakonen und Evangelisten," in *Biblische und Kirchenhistorische Studien* (München, 1893); Revile, *Les origines de l'épiscopat* (Paris, 1895); Zahn, *Missionarismethoden im Zeitalter der Apostel* (Erlangen, 1886); Harnack, *The Expansion of Christianity in the First Three Centuries* (2d ed., 2 vols., London, 1908); *The Constitution and Life of the Church in the First Two Centuries* (ib., 1910).

EVANGELISTARION (ML., from MGK. *εὐαγγελιστάριον*, book of selections from the Gospels, from Gk. *εὐαγγέλιον*, *euangelion*, gospel). A lectionary or service book of the Greek church, containing the lessons taken from the Gospels for each day in the year. The custom of assigning to each day some portion or portions of Scripture as its appropriate reading was in vogue very early in the Eastern church. In process of time usage in this respect became quite uniform, each day of the year having its special lesson from the Gospels and another from the Epistles or Acts. In addition to these regular daily readings, holy and saints' days had their own appropriate readings assigned. It was customary to mark, in red ink, in the text of New Testament manuscripts, where the appointed lessons began or ended, by the words or abbreviations *ἀρχή* or *ἀρχ* (= beginning) and *τέλος* or *τελ* (= end), while on the margin or at the bottom of the page the day to which the lesson belonged was indicated. But more convenient for use were the books, often called lesson or service books, containing collections of the readings arranged in chronological order. If such a book included only Gospel lessons, it was called an *Evangelistarion*; if the lessons were those from the Acts and Epistles,

the book was called a Praxapostolos. If the book included both, it was a Euchologia, or Book of Offices. Lists or tables of such readings were also in circulation, called Synaxaria. If a table was of the daily readings only, it was called an Eclogadion; if of the readings for saints' days only, it was called a Menology. Hundreds of manuscripts of Evangelistaria are in existence, some of them quite sumptuous. They date from the sixth century onward, and many are of considerable value for the textual criticism of the New Testament. Consult Scrivener, *Introduction to the Textual Criticism of the New Testament* (4th ed., London, 1894), and C. R. Gregory, *The Canon and Text of the New Testament*, pp. 384-393 (New York, 1907). See LECTONARY.

EVANGELISTS, SYMBOLS OF THE FOUR. The symbolism by which the four Evangelists are represented by certain living figures had its origin with Irenaeus and is founded on the passage in the Book of Revelation (iv. 64) which describes the four living creatures before the throne of God. It secured wide currency in the Church, though there was little or no agreement as to the order in which the creatures were assigned to the separate Evangelists. The order which is best known and is most largely represented in Christian art is that which prevailed throughout the Western church from the time of Jerome. In this Matthew is represented by a man, Mark by a lion, Luke by a calf, and John by an eagle. The earliest symbol used to typify the Evangelists as a class was four scrolls, or four books, placed in the four angles of a Greek cross. Later the symbol of four rivers was used. The conventional symbols referred to above came into use in the fifth century. Consult Mrs. Henry Jenner, *Christian Symbolism* (Chicago, 1910); and Elizabeth E. Goldsmith, *Sacred Symbols in Art* (New York, 1911).

EVANS, ALEXANDER WILLIAM (1868-). An American botanist, born at Buffalo, N. Y. He was educated at Yale University (Ph.B., 1890; M.D., 1892; Ph.D., 1899), and at Munich and Berlin. After 1895 he taught botany at Yale, in 1906 becoming Eaton professor at Sheffield Scientific School. In 1911 he was president of the Botanical Society of America. His investigations cover the Hepaticæ of Alaska and Japan, and the bryophytes of Connecticut.

EVANS, SIR ARTHUR JOHN (1851-). An English archaeologist, born in Nash Mills, Herts, the son of the antiquary Sir John Evans. He was educated at Harrow, at Brasenose College, Oxford, and at Göttingen, and for 10 years after 1873 traveled in eastern Europe, especially the Balkans, publishing *Illyrian Letters* (1878), and being imprisoned in 1882 charged with conspiracy in southern Dalmatia. In 1884-1908 he was keeper of the Ashmolean Museum, Oxford. In 1893 he undertook investigations in Crete (q.v.) of the utmost archaeological and historical importance, particularly in the discovery of what he considered to be a pre-Phœnician script (see ARCHAEOLOGY, *Minoan or Aegean Period*). Among his works are: *Through Bosnia* (1895); *Cretan Pictographs and Pre-Phœnician Script* (1896); *Further Discoveries of Cretan and Aegean Script* (1898); *Scripta Minoa* (1909). He was knighted in 1911. In 1878 he married a daughter (died 1893) of E. A. Freeman, the historian, the fourth volume of whose *Sicily* he published with revisions and additions.

EVANS, AUGUSTA JANE (1835-1909). An

American author. She was born near Columbus, Ga., but when a child removed with her father to San Antonio, Tex., which the family left after two years (1847-49) to settle in Mobile, Ala. She was married to L. N. Wilson in 1868. Her works consist of a number of novels, popular in their time, such as *Inez: A Tale of the Alamo* (1856); *Beulah* (1859); *Saint Elmo* (1866); *Vashti* (1869); *At the Mercy of Tiberius* (1887); *A Speckled Bird* (1902).

EVANS, CHRISTMAS (1766-1838). A Welsh Baptist preacher. He was born at Isgaerwen, Cardiganshire, on Dec. 25, 1766. He was brought up among Presbyterians, but became a Baptist in 1788 and was ordained as a missionary among the Baptists in Carnarvonshire (1789). In 1792 he removed to Anglesey, and till 1826 lived there, and virtually exercised episcopal functions over his brethren. His arbitrary and dictatorial conduct was offensive and compelled his removal to Glamorganshire in 1826. In 1828 he went to Cardiff, and in 1832 to Carnarvon. He was familiar to all Welshmen by reason of his journeys over the principality in behalf of church building, and famous for his eloquence. He died at Swansea, July 19, 1838. For his biography, consult Hood (London, 1881).

EVANS, EDWARD PAYSON (1831-1917). An American author and scholar. He was born at Remsen, N. Y., moved to Michigan in 1850, and was educated at the University of Michigan (A.B., 1854; A.M., 1857), where, after several years of teaching in Mississippi and Wisconsin, he was professor of modern languages and literatures in 1862-67. After 1870 he resided in Europe, and after 1884 he was on the staff of the *Allgemeine Zeitung* of Munich. He also became known as a contributor to German and American reviews and periodicals. His publications include: *Adolf Stahr's Life and Works of Gotthold Ephraim Lessing* (1866); *Athanasius Coquerel, Jr.'s First Historical Transformation of Christianity* (1867); *Abriss der deutschen Literaturgeschichte* (1869); *A Progressive German Reader* (1870); *Animal Symbolism in Ecclesiastical Architecture* (1896); *Evolutional Ethics and Animal Psychology* (1897; 2d ed., 1898); *Beiträge zur Amerikanischen Literatur und Kulturgeschichte* (2 vols., 1898-1903); *The Criminal Prosecution and Capital Punishment of Animals* (1906).

EVANS, EDWARD RADCLIFFE GARTH RUSSELL (1881-). A British explorer, educated at Merchant Taylors' School. Entering the British navy in 1897, he became sublieutenant in 1900, lieutenant in 1902, and commander in 1912. In 1902-04 he served on the *Morning*, sent in relief of the Discovery expedition. In 1909 he joined the British Antarctic expedition as second in command, and after Captain Scott and several of his companions had perished on an advance expedition, late in December, 1912, Evans returned in command of the expedition. (See POLAR RESEARCH.) In 1914 he lectured in the United States on the Scott expedition. He was awarded the Shadwell testimonial prize in 1907 and the cross of the Legion of Honor in 1914, and was created C.B. in 1913.

EVANS, EVAN HEBER (1836-96). A Welsh Congregational clergyman, born near Newcastle, Emlyn, Cardiganshire. Educated at the Normal College, Swansea, and the Memorial College, Brecon, he served as pastor of Lebanus Church, Morriston (1862-65), and of Salem Church,

Carnavon (1865-94), becoming especially celebrated as an eloquent pulpit orator. He filled the chair of the Welsh Congregational Union in 1886 and of the Congregational Union of England and Wales in 1892 and in 1894 became principal of the Congregational College at Bangor. He also edited the Welsh Congregational magazine, *Y Dysgedydd*. Consult his *Life* by H. Elvet Lewis.

EVANS, FREDERICK WILLIAM (1808-93). An American reformer. He was born in England, but came to the United States in 1820, was apprenticed to a hatter and, in the intervals of his work, studied the writings of Owen, Fourier, and other social reformers, and became a thoroughgoing Socialist. After visiting the Shakers at Mount Lebanon, N. Y., he determined to join them and soon became an elder and a recognized leader. By his teachings he modified the doctrines of the sect. Among his writings are: *Autobiography of a Shaker* (1869; new ed., 1888); *Shaker Communism* (1872); *The Second Appearing of Christ* (1873).

EVANS, SIR GEORGE DE LACY (1787-1870). A British soldier and politician. He was born in Limerick, Ireland, entered the British army in 1806, was present, as lieutenant colonel of infantry, at the capture of Washington, the attack on Baltimore, and the operations before New Orleans, in the War of 1812, and fought under Wellington at Waterloo. He served in Parliament in 1831-32 and from 1833 to 1841 and again from 1846 to 1865, as a representative of the "Advanced Liberals," and in 1835 commanded the British Auxiliary Legion in Spain. In 1854 he was promoted lieutenant general and was selected to command the second division of the army in the Crimea, where he distinguished himself at Alma and Inkerman. He was promoted general in 1861.

EVANS, HENRY CLAY (1843-1921). An American Republican politician, born in Juniata Co., Pa. In 1864 he enlisted in the Forty-first Wisconsin Infantry, subsequently established manufacturing of iron and railway cars at Chattanooga, Tenn., and was twice elected mayor of that city. From 1889 to 1891 he was a member of Congress and from 1889 to 1893 Assistant Postmaster-General. In 1894 he was elected Governor of Tennessee in accordance with the original returns, but on a recount by the Legislature certain returns were thrown out as irregular, and the Democratic candidate, Peter Turney, was declared elected. At the Republican National Convention of 1896 he was second in the balloting for Vice President. He was United States Commissioner of Pensions in 1894-1902, and Consul General at London from 1902 till 1905. In 1911, when the city of Chattanooga adopted a commission form of government, he became commissioner of education and health.

EVANS, HUGH DAVEY (1792-1868). An American author. He was born in Baltimore, was admitted to the Baltimore bar in 1815, and attained eminence as a constitutional lawyer. He was prominent in the councils of the Protestant Episcopal church, edited several religious newspapers between 1843 and 1858, and from 1852 to 1864 was lecturer on civil and ecclesiastical law in St. James's College, Maryland. The most important of his publications is his *Treatise on the Christian Doctrine of Marriage*, published posthumously in 1870. Consult Harrison, *Memoir of Hugh Davey Evans* (Hartford, 1870).

EVANS, SIR JOHN (1823-1907). An English antiquary. He was born in Market Bosworth, Leicestershire, and was educated by his father. He made a fortune in paper manufacture and thereafter devoted himself largely to collecting coins and antiquities. His researches embrace the departments of geology, archaeology, and numismatics, and his collection of coins ranks among the first in England. He was president of the Geological Society (1874-76), the Numismatic Society (1875-1902), the Society of Antiquaries (1885-92), the British Association (1897-98), and the Egyptian Exploration Fund. His principal publications include *Coins of the Ancient Britons* (1864; supplement, 1890) and *The Ancient Stone Implements, Weapons, and Ornaments of Great Britain* (1872; 2d ed., 1897), both of which have been translated into French.

EVANS, JOHN GWENOGVRYN (1852-). A Welsh scholar, born in Ffynon Velled, Carmarthenshire, and educated at the Presbyterian College of Carmarthen, at Owens College, and at Oxford, where he received an honorary M.A. in 1887 and Litt.D. in 1903. He was editor of the *Series of Old Welsh Texts* and, in 1894-1906, inspector of Welsh documents for the Historical Manuscripts Commission. He published valuable reports on Welsh manuscripts, and the *Red Book Mabinogion* (1887), the first edition of the *White Book Mabinogion* (1907), *Facsimile and Text of Book of Aneirin* (1908), *Facsimile of Chirk Codex of Welsh Laws* (1909), *Facsimile and Text of Book of Taliessin* (1910), and *Amlyn and Amic* (1912).

EVANS, MARGARET J. (1842-). An American educator and club woman, born at Utica, N. Y. She graduated from Lawrence University in 1869 (A.M., 1872) and also studied in Paris, Berlin, Heidelberg, and Oxford. From 1874 to 1908 she was professor of English literature and dean of the woman's department of Carleton College. She served as president of the Minnesota Congregational Woman's Board of Missions after 1879 and of the Minnesota Federation of Women's Clubs in 1895-99, as chairman of the Minnesota State Public Library Commission, as the first woman corporate member of the American Board of Commissioners for Foreign Missions (Congregational), and as second vice president (1900-02) and honorary vice president for life (after 1908) of the General Federation of Women's Clubs. She is author of *Woman as Citizen* and also of several published addresses.

EVANS, MARY ANN or MARIAN (1819-80). An English novelist, the author of *Adam Bede*, *Felix Holt*, *Middlemarch*, *Daniel Deronda*, etc. She wrote under the pseudonym George Eliot, and under this title her life and works are described. See ELIOT, GEORGE.

EVANS, OLIVER (1755-1819). An American inventor. He was born at Newport, Del., and in his early youth was apprenticed to a wheelwright, thus being afforded an opportunity of displaying uncommon inventive genius. When 22 years of age, he invented a machine for making the wire card teeth used in carding cotton and wool, which hitherto had been produced by handwork. He later invented improved machinery for flour mills, which enabled the miller to make not only finer flour, but 20 pounds more to the barrel, at the same time cutting down the cost of labor one-half. Having invented a steam engine, in 1786 he asked for a patent from the Legislature of Pennsylvania for its application

to mill machinery and to the steam carriage. Evans made the first high-pressure steam engine and the first steam dredging machine used in the United States. This dredge, weighing about 4000 pounds, was put on wheels and propelled itself to the Schuylkill River, $1\frac{1}{2}$ miles distant, where it was connected to a stern paddle wheel and navigated the Schuylkill down to its junction with the Delaware. This is supposed to have been the first actual propulsion of a carriage on land by steam in America. He designed and constructed an engine for a steam vessel on the Mississippi River, but the boat in which it was to be mounted was never completed, and the engine was installed in a saw mill, where it ran most successfully. He built many steam engines and invented much new machinery and has been termed the "Watt of America." He died in New York, April 21, 1819. Consult Thurston, *Growth of the Steam Engine* (New York, 1878).

EVANS, ROBLEY DUNGLISON (1846-1912). An American naval officer, born in Floyd Co., Va. He graduated at the United States Naval Academy in 1863, served in the West Indies, and participated, with the North Atlantic blockading squadron, in both attacks on Fort Fisher, and in the second was severely wounded. In 1866, however, he returned to the service as a lieutenant. He was lighthouse inspector (1882-86), in 1891-92 commanded the *Yorktown* at Valparaiso, Chile, where American sailors were killed by a Chilean mob (and where Evans gained the sobriquet of "Fighting Bob"): policed the Bering Sea sealing grounds with much vigilance; was made captain in 1893, and in 1896 was transferred to the *Indiana*, the first battleship commissioned by the United States. Later, he was attached to the Lighthouse Board (1897), and during the war with Spain commanded the *Iowa*, taking a prominent part in the battle of Santiago, where the fire of the entire Spanish fleet was at one time concentrated on his ship. In 1898, at his own request, Evans was detached from the *Iowa* and afterward was made a member of the Board of Inspection and Survey. He was advanced to the rank of rear admiral Feb. 11, 1901. It was on Evans's recommendation that steel was first used for American battleships. He was escort to Prince Henry of Prussia, during the latter's visit to the United States in 1902, and in 1904 commanded the fleet in the Far East. In December, 1907, he took command of the fleet which left Hampton Roads for a cruise around the world; but after rounding Cape Horn, and reaching San Francisco, Evans was forced by ill health to give up the command. In 1908 he was retired, with the thanks of the Navy Department. He published two volumes of reminiscences, *A Sailor's Log* (1901) and *An Admiral's Log* (1910).

EVANSTON. A city in Cook Co., Ill., 12 miles north of Chicago, of which it is a popular suburb, on Lake Michigan, and on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads (Map: Illinois, J 1). It is beautifully situated on the lake and contains the Northwestern University (q.v.), the Garrett Biblical Institute, and a public library. It is the national headquarters of the Women's Christian Temperance Union. Settled about 1835, Evanston was incorporated about 1890. Its government is administered by a mayor, elected biennially, and a unicameral city council. With the exception of the city treasurer and city clerk, who are chosen by popular elec-

tion, all municipal officials are nominated by the mayor, with the consent of the council. The city owns and operates its water works. Pop., 1900, 19,259; 1910, 24,978; 1914 (U. S. est.), 27,724; 1920, 37,215.

EVANSTON. A town and the county seat of Uinta Co., Wyo., 90 miles west-southwest of Rock Springs, on the Bear River, and on the Union Pacific Railroad (Map: Wyoming, A 4). It is the seat of the State Institution for the Insane and contains a fine courthouse and public library. The city is in an agricultural, stock-raising, and coal-mining district and has oil fields, large ice plants, and railroad repair shops. The water works are owned by the town. Pop., 1900, 2110; 1910, 2583.

EVANSVILLE. A city, port of entry, and the county seat of Vanderburg Co., Ind., about 150 miles (direct) west-southwest of Indianapolis, on the Ohio River, and on the Chicago and Eastern Illinois, Cleveland, Cincinnati, Chicago and St. Paul, the Southern, the Louisville and Nashville, and the Illinois Central railroads (Map: Indiana, B 9). Among the more prominent buildings are the customhouse, courthouse, city hall, United States Marine Hospital, State Hospital for the Insane, Elks' Home, St. Mary's and Deaconess hospitals, Carnegie libraries, high school, Little Sisters' Home for the Aged, and Willard Library. Other features of interest are Cooke's, Mesker, Sunset, and Garvin parks. Coal abounds in the vicinity, and the city has a large trade in coal, timber, grain, pork, tobacco, and flour. Abundant water power is supplied by a large government dam, erected on the Ohio River, near here, at a cost of \$2,000,000. The industrial plants include foundries and machine shops, breweries, flouring mills, furniture factories, plow works, and establishments for the manufacture of cotton and woolen goods, leather, glass, stoves, steam shovels, gas engines, cigars, buggies and wagons, wire fence, metal beds, etc. The government is administered by a mayor, elected every four years, and a city council, seven of the members of which are elected by wards and three at large. All other officials, excepting the clerk and the police judge, who are elected, are appointed by the executive. The receipts of the city in 1912 were \$3,479,000, and its payments the same amount, the chief items being: education, \$282,000; police, \$83,900; fire, \$95,200; and water works and filtration plant (owned by the city), \$80,700. Evansville was founded in 1816 by Gen. Robert M. Evans, became the county seat in 1819, and with a population of 4000 was incorporated as a city in 1847. It was reincorporated in 1905. Pop., 1890, 50,750; 1900, 59,007; 1910, 69,647; 1914 (U. S. est.), 71,284; 1920, 85,264.

EVAPORATION (Lat. *evaporatio*, from *evaporare*, to evaporate, from *e*, away + *vaporare*, to emit vapor, from *vapor*, vapor), or **VAPORIZATION**. The change of state from solid or liquid to gaseous. All substances emit vapors, and those which at ordinary temperatures evaporate rapidly are said to be volatile. If the vessel in which a liquid is allowed to evaporate be open, the vapor will diffuse through the air, and evaporation will go on until there is no more liquid left. But if a liquid is placed in an air-tight vessel, evaporation goes on until the vapor escaping from the liquid has attained a certain definite pressure within the vessel, and then a "dynamic" equilibrium is established; i.e., evaporation will not really cease, but the amount

of vapor condensed in a given time becomes exactly equal to the amount of liquid vaporized in the same time, and hence, as a net result, no further change can be observed. At any rate, whether this conception of the equilibrium attained is correct or not, the vapor from a single liquid attains, within a closed vessel, a certain maximum of pressure, which is determined almost entirely by the nature of the liquid and its temperature. Dissolving a foreign substance in a liquid always *diminishes* the vapor pressure of the liquid. Mechanical compression of the liquid by means, say, of an insoluble gas always *raises* the vapor pressure of the liquid, because such compression causes the liquid to occupy a smaller space. On the other hand, if the surface of a liquid is curved, as it is in a capillary tube, the vapor pressure of the liquid is considerably *diminished*. At the same temperature different liquids have different vapor tensions, and when the temperature is raised, the vapor tension of each is increased by an amount depending, again, upon the nature of the liquid. When the vapor of a substance has attained its full pressure, it is said to be *saturated*. The full vapor tension corresponding to a certain temperature is not attained instantaneously, since evaporation requires *time*. The rate of evaporation depends on a large number of circumstances, some of which are more or less accidental, i.e., have nothing to do with the nature of the liquid experimented upon. Thus, the size, shape, and material of the vessel in which evaporation is allowed to take place have a considerable influence on the rate. Other factors are the temperature of the liquid itself, the density of the atmosphere above its surface, and the magnitude of the surface exposed, shallow vessels being employed when rapid and copious evaporation is required. In case the liquid is a mixture or a solution, the rate of evaporation depends greatly upon its composition and upon the nature of the several constituents.

The Heat of Evaporation. The temperature of pure boiling water remains constant; yet heat must be continually supplied to it in order that evaporation may go on; the heat does not appear as sensible heat, but is required to produce the change of state. The heat required to convert one gram of a substance into vapor is called its *heat of evaporation*. The laws of thermodynamics lead to methods that permit of calculating the heat of evaporation of a substance if certain other numerical data in connection with the substance are known. Thus, if the volume occupied by one gram of a liquid is V' , and the volume occupied by one gram of its saturated vapor is V , the "absolute temperature" being T (by the absolute temperature is meant the ordinary centigrade temperature increased by 273), and if the increase in the vapor pressure produced by a rise of 1° in temperature is denoted by the symbol $\frac{dp}{dT}$, then the heat of evaporation, l , may, according to Clausius, be calculated by the following formula:

$$l = T \frac{dp}{dT} (V - V').$$

At the critical temperature (see CRITICAL POINT) there is no difference between a liquid and its vapor; the difference between the volumes occupied by one gram of liquid and one gram of vapor is naught, and the heat of evapo-

ration is likewise naught, as is shown by the above formula.

Cooling by Evaporation. Since the transformation of liquids into vapors involves the absorption of heat, a liquid may be cooled by allowing it to evaporate without supplying heat to it from any outside source; the evaporation will then take place at the expense of the sensible heat of the liquid itself, and as a result the temperature will be lowered. Thus, the rapid evaporation of liquid ammonia or of sulphurous acid produces temperatures low enough for water to freeze and is employed in making artificial ice. Liquid ethylene evaporates rapidly and produces temperatures low enough for compressed air to be liquefied; the evaporation of the air thus liquefied produces still lower temperatures, and in this manner the most refractory gases, including helium and hydrogen, have been liquefied. When liquefied carbonic acid is forced, by the pressure of its own vapor, in a fine stream into the air, it evaporates so rapidly that a portion of the stream is frozen.

Evaporation is continually going on in nature on a gigantic scale. Vapor from the ocean is continually rising into the atmosphere, it then condenses into mists or clouds and, under certain conditions not as yet fully understood, falls as rain, hail, or snow, to be again evaporated from the ground, or from rivers, lakes, and seas.

A very useful annotated bibliography of evaporation by G. J. Livingston was published in the *Monthly Weather Review* (Washington, June, 1908, to June, 1909). Important papers on evaporation in the United States will be found in the *Monthly Weather Review* (Washington, 1886, vol. xiv, p. 299; 1888, vol. xvi, pp. 235-239, map; and 1907, vol. xxxv, to 1910, vol. xxxviii). A summary of our knowledge of the subject will be found in the same journal for March, 1914. Consult Hausbrand, *Verdampfen, Kondensieren, und Kühlen* (5th ed., Berlin, 1912). See BOILING POINT; VAPOR.

EVAPOROMETER. See ATMOMETER.

EVARTS, JEREMIAH (1781-1831). An American editor. He was born at Sunderland, Vt., graduated at Yale in 1802, and practiced law in New Haven. From 1810 to 1820 he was editor of the *Panoplist*, and in 1820, when the *Missionary Herald* was issued in its stead, he took charge of that periodical. In 1821 he was chosen corresponding secretary of the American Board of Commissioners for Foreign Missions. He was an efficient organizer of Christian missions and took an active part in the movement to secure justice for the Indian tribes. Consult Tracy, *Memoirs of Jeremiah Evarts* (Boston, 1845).

EVARTS, WILLIAM MAXWELL (1818-1901). An eminent American lawyer and statesman. He studied at the Harvard Law School until 1839. In 1841 he was admitted to the bar. He was deputy United States district attorney from 1849 until 1851 and district attorney from 1851 until 1853. In 1860 he attended the National Republican Convention in Chicago as the chairman of the New York delegation and nominated Seward for the presidency. During the Civil War he was secretary of the Union Defense Committee and was sent by President Lincoln on a diplomatic mission to England. He was the senior counsel of President Johnson in the great impeachment trial of 1868 (see JOHNSON, ANDREW) and did much to secure his acquittal. From July, 1868, until March 4, 1869, he was Attorney-General of the United States. In 1872

he acted as chief counsel of the United States before the Geneva Court of Arbitration. In the contest between Hayes and Tilden in 1877 for the succession to the presidency, Evarts was the leading counsel of the Republicans before the Electoral Commission (q.v.). He was appointed Secretary of State by President Hayes and served throughout the term. In 1881 he was sent as a delegate of the United States to the International Monetary Conference at Paris, and from 1885 to 1891 he served in the United States Senate. He then retired both from politics and from the bar. Among his public addresses are the eulogy on Chief Justice Chase, delivered at Dartmouth in 1873; the Centennial oration delivered in Philadelphia in 1876; and his orations at the unveiling of statues in New York to William Seward and Daniel Webster.

EVE. The name of the first woman in Gen. iii. 20. Ordinarily she is only spoken of in the narrative as "the woman," but in this passage and in Gen. iv. 1 the proper name occurs. Hebrew folk etymology explains it as "the living one"; she was so called "because she became the mother of all living." Since Hawwah is not the Hebrew word for "living," some scholars regard the name as a late addition, made at a time when Aramaic had become the vernacular; others assume that the original meaning was "serpent," and that a serpentine chthonic divinity was once considered the mother of mankind. It should be said, however, that there is no direct evidence of such a goddess, and that the figure of Eve has not been found in Babylonian mythology. No woman is connected with the story of ADAM (q.v.), and it is still doubtful what the significance is of the representation on a seal of a man and a woman, a tree and a serpent. The first account of creation (Gen. i) does not mention a first woman any more than a first man; like the other living beings, the human race is created en masse, "males and females created he them" (verse 26). According to Gen. ii. 15 ff. Eve was made out of a rib taken from Adam while he was in a deep sleep, after none of the animals fashioned and brought before man to be named had proved to be a helper that might stand before him. In Gen. iii. Eve learns from a wise serpent the virtues of the fruit of a tree in the midst of the garden of Eden, shares the fruit with her husband, and, as predicted by the serpent, they become like gods, so that the deity declares "now that man has become like one of us" (verse 22), they know good and evil, and would live forever, if they were not driven out of the garden. Consult Breymann, *Adam and Eve* (Göttingen, 1893), and Gunkel, *Genesis*, 3d ed. (Berlin, 1912). See ADAM.

EVE, PAUL FITZSIMMONS (1806-77). An American physician. He was born near Augusta, Ga., and graduated at Franklin College (Georgia) in 1820 and at the University of Pennsylvania Medical College in 1828. He then studied in Europe for several years and acted as surgeon in the Polish Revolution of 1831. He was professor of surgery in Georgia Medical College (1832-49), and in the universities of Louisville (1849), Nashville (1850-68), and Missouri (1868-77). In 1857 he was president of the American Medical Association. He published more than 600 articles on medical subjects. His most important publication is *Remarkable Cases in Surgery* (1857).

EVECTION (Lat. *evectio*, a carrying up-

ward, from *evehere*, to carry out, from *e*, forth + *vehere*, to carry). The greatest of the lunar perturbations or inequalities. It depends upon the alternate increase and decrease of the eccentricity of the moon's orbit. Evection may change the moon's geocentric longitude by as much as 1° 15' and alter the time of occurrence of an eclipse by six hours. See LUNAR THEORY.

EVELETH, év'ê-léth. A city in St. Louis Co., Minn., 71 miles north by west of Duluth, on the Duluth, Missabe, and Northern, and the Duluth and Iron Range railroads (Map: Minnesota, E 3). It contains a public library and three parks. Eveleth is in a rich iron-mining region and has lumber and dairying interests. The city adopted the commission form of government in 1913. It owns its water works. Pop., 1900, 2752; 1910, 7036.

EVELYN, JOHN (1620-1706). An English author and virtuoso, born Oct. 31, 1620, at Wotton, the family seat, Surrey. Educated first at the free school of Lewes, he was afterward for a short time at Balliol College, Oxford, and also studied at the Middle Temple. During the Civil War he found it prudent to pass much of his time on the Continent, though he served in the King's army for three days (1642) and lived in England for two years (September, 1647, to June, 1649). Returning to England in 1652, he settled at Sayes Court, Deptford, where he lived quietly, amusing himself with gardening till the Restoration. A trusted Royalist, he was much employed by the government, though he was given no high office. He was of those who were instrumental in the formation of the Royal Society, in which he was one of the first and most valuable members. In 1694 he removed from Sayes Court to Wotton, where he died, Feb. 27, 1706. Evelyn wrote upon a great variety of subjects—art, architecture, gardening, and commerce. These works, of which there are about 30, have little permanent value. His *Sylva, or a Discourse of Forest Trees* (1664) was long a standard work. His *Sculptura* appeared in 1662, and *A Character of England* in 1659. His *Diary* is the work by which he lives. It covers about 70 years, and these the most dramatic in the history of England. It is of inestimable value. Scott said he had "never seen a mine so rich." The *Diary* was first published in 1818-19. The sixth edition, with *Life* by Wheatley, appeared in London (1879). A good later edition is *Diary and Correspondence* (London, 1906).

EVENING GROSBEEK. See GROSBEEK.

EVENING PRIMROSE. See CENOTHERA.

EVENING SCHOOLS. Schools found in England, the United States, and the leading continental countries of Europe, whose principal object is to provide either elementary or special instruction for those who are unable to attend day schools on account of the necessity of earning a livelihood. They supply three classes of wants: (1) primary instruction, for the illiterate, juvenile or adult; (2) vocational training, commercial or industrial; (3) the desire for some higher, liberal culture on the part of the masses generally, and especially of those who have enjoyed few or no opportunities for advanced instruction in the ordinary schools. The evening school, from being a place for mere primary instruction, has in recent years become more and more either a vocational or a higher-culture school. Such schools are the mechanical institutes, workingmen's colleges, and the con-

tinuation schools established by local authorities in England, the Prussian *Fortbildungsschulen*, the various classes of courses for adults, the evening work in the apprentice schools in France, and the evening high schools and such institutions as Cooper Union in the United States.

In Germany the evening schools may be said to have sprung from the old Sunday schools, which in 1760 began to give, in addition to religious instruction, some training in primary work. Late in the eighteenth century cities took up the task of supplementing the somewhat meagre education that some of the poorer children had received, Berlin being the first to found a free school for manual workers. In 1844 the Prussian Cultusminister issued a circular calling attention to the need of such schools, but, although this was immediately followed by considerable activity in the matter, it soon languished. Eventually, however, their number increased, and their position became more definite. They extended the time of instruction to from four to eight hours a week, occupying evenings usually. With the rapid development of industrial and commercial life, and the elaboration of the school system, they turned more and more to giving instruction in technical and commercial matters. Their curriculum, originally confined to German and arithmetic, came to include elementary geometry and drawing, then history, geography, and natural science, with bookkeeping, correspondence, etc. These *Fortbildungsschulen*, or continuation schools, attempt to fit the course of study to the occupations of the school locality. Those in the cities are classified as commercial and industrial, while those in the country emphasize subjects of study relating to agriculture. They are often connected with schools for special trades or occupations, and in fact such schools are classified under continuation schools frequently. Many of them do not carry on their work in the evening. In 1912 the *Fortbildungsschulen*—public and guild—were attended by 473,381 industrial and 56,172 commercial students under compulsory regulations, and 22,729 industrial and 3296 commercial attended voluntarily. The tendency throughout Germany is to make attendance in continuation schools, held more usually in the daytime, compulsory, to relate the work of the schools with the trade of the student, and to provide a general training in citizenship along the lines successfully inaugurated in Munich by Dr. George Kerschensteiner.

Although schools for the education of adults had existed in France as early as 1709, the notion of having evening schools for this purpose seems to have been introduced from England in 1820, when such an institution was established in Paris. After 1830 the movement was extended, and in 1867 there were 35,000 such classes in France. A decline in number followed, but recently they have again been on the increase, numbering, in 1911-12, 52,797 courses for male and female students. The classes for women are generally separate from those for men. The work is (1) for illiterates, or (2) a review and extension of primary work, or (3) preparation for special vocations. There is thus an extensive system of continuation schools—*education post-scolaire*—which give vocational courses and award certificates of attendance. Many of these courses are given in the evenings. But, as in England, there is a strong feeling that attendance should be made compulsory for

several years after the elementary school age. At present not more than about 600,000 students attend these courses. In 1876 the *Comité d'encouragement des Etudes Commerciales* began the establishment of commercial evening schools, while the *Société Polytechnique* and the *Société Philotechnique*, founded in 1830 and 1848 respectively, are now offering evening instruction in commercial branches, industrial and constructive arts, and mathematics. Such private agencies provide about 6000 courses in addition to the number of public courses given above. In addition there is a considerable movement in the direction of university extension courses, which are held in the evening. In general it may be said that the French evening schools do not attend quite so much to liberal and ethical training as do the German continuation schools, but emphasize more specific industrial and commercial work.

In England the first evening school proper for instructing boys and girls who had to work all day for a livelihood was founded in 1806 at Bristol by the Benevolent Evening Schools Society. The first school established exclusively for adults was in Bala, Merionethshire, in 1811, by the Rev. T. Charles. Similar schools were founded in Bristol in 1812 and in London in 1816. In a few years they existed in 30 towns. The government, through the science and art department and the education department, began to grant for their support certain allowances out of the public fund for education. These were, however, very sparing until 1861, when a revision of the code permitted day-school teachers to teach in the evening schools. Aid to teachers was withdrawn, but capitation grants were made on the average attendance and for successful examinations. The result was a great increase in the sums obtained for such schools as were devoted to review work, etc., and as also had paid certificated masters instead of voluntary ones. At the same time the schools devoted to illiterate adults were left largely to the care of private beneficence. This type of school, however, became constantly less and less necessary, while the evening continuation school developed into a more and more elaborate institution. Until 1890 its curriculum was confined to elementary subjects, and no aid was granted to pupils over 21. At that time, however, and especially by the Code of 1893, the course was enlarged, the attendance of persons over 21 recognized, and the method of granting money changed so as to recognize the work of the school as a whole, rather than the attainments of the individual pupil. The schools, as a result, became largely secondary, and their attendance steadily increased. In 1898 the attendance in England and Wales was 435,600 in 5535 schools. In 1900, however, came the Cockerton Judgment, by which it was declared to be illegal to apply the parliamentary grants for other than elementary education or for pupils above 14. This obstacle was removed by the Education Act of 1902, which empowered local education authorities to provide higher education out of the rates. The work which had been done under the science and art department's supervision had not been interfered with. The evening schools as organized at present are in session three or four evenings a week for two hours from September to April. So far as possible students are encouraged to take work by courses rather than isolated subjects, and graduated schemes lasting several

sessions have been established. The subjects are grouped in six divisions: I. (a) Preparatory and general, including elementary school subjects, civics, and music; (b) literary and commercial, including foreign languages, economics, commercial law, etc. II. Art. III. Manual or industrial instruction. IV. Science and mathematics. V. Home occupations and industries for women. VI. Physical training. More attention is being paid to social work and the schools are beginning to be centres for numerous social activities. An interesting scheme was introduced in London in September, 1913, to provide a coördinated system of evening instruction in commercial, technical, art, domestic, women's trades, and nonvocational subjects to be taught by full-time or half-time teachers. In 1911-12 the Board of Education recognized 7749 centres for evening education attended during the year by 722,776 students, of whom 606,580 earned the grant. Statistics hardly indicate the success or otherwise of the evening schools, which can only be measured by the persistence of attendance; for while enrollment figures may be high at the beginning of the year, there is a sad falling off towards the end. It is felt very generally that England must introduce compulsory attendance up to the age of 17 or 18.

In the United States evening schools were established at first largely to provide for children in the great cities who were occupied during the day. Attendance at them has been confined principally to older children and adults. They were tried in New York City in 1834, but failed for want of teachers. Fourteen years later the Public School Society successfully reestablished them. Within two years they had 15 schools and 8000 pupils. The Boston evening schools were legally recognized in 1857. In 1911-12 there were evening schools in 204 cities having 10,000 inhabitants or more. They were situated in 34 States, although 41 were in Massachusetts. The attendance was made up largely of pupils who did not attend day classes. In most cities the schools were kept open only a few months, and the work was inferior and inadequate. As a result the attendance did not increase rapidly, or even declined. The establishment of evening high schools, which emphasize commercial and technical work, has come to remedy this situation, and the United States finds, as other countries have found, that secondary evening instruction is more in demand and more effective than that of the primary grade. In 1884 five large cities had evening high schools, and since then their number has steadily increased, until in 1911-12 there were such high schools in 81 cities with a population of 10,000 and over, enrolling 134,818 pupils and having an average attendance of 46,575. The tendency generally is to provide evening schools in which those already engaged in some wage-earning occupation can improve themselves in their trade and along general lines. Thus, by law of 1911 Massachusetts has provided for the establishment of extension courses with related work for men and women, and preparatory courses for women as well as courses in home making to be given in the evening as part of the State-wide provision of vocational education. In addition a variety of means has come into existence by which liberal and vocational instruction is given to people whose time is occupied during the day. Among the most notable are Maryland Institute, Baltimore, and Cooper Union, New York. The latter institution

was incorporated in 1857. It furnishes advanced instruction in mathematics and the natural sciences, with applications to the various trades. There is a school of art also, in which attention is paid to the more mechanical of the fine arts, such as engraving, etc. The Young Men's Christian Associations also have established in some cities extensive lines of instruction, carried on mostly in the evening. Much of the university settlement, university extension work, and public-lecture systems also occupy evening hours, and with them the account of the principal lines of evening instruction in the United States may be concluded.

The evening school exists also in European countries other than those already mentioned, as in Holland, Italy, and Switzerland. These nations have been called upon to deal with the same problems which have characterized the development of this school everywhere, and in solving which it has turned more and more towards vocational instruction and liberal studies in advance of the primary grade. Consult: Balfour, *The Educational Systems of Great Britain and Ireland* (Oxford, 1912); Teegan, *Technical and Industrial Education in France* (London, 1892); *Reports of United States Commissioner of Education*, passim; A. J. Jones, *Continuation Schools in the United States* (Washington, 1907); M. E. Sadler, *Continuation Schools in England and elsewhere* (Manchester, 1906); O. Pache, *Handbuch des deutschen Fortbildungswesens* (Wittenberg, 1902). See NATIONAL EDUCATION, SYSTEMS OF.

EVENTOG'NATHI. See PLECTOSPONDYLL.

EVERDINGEN, A'vër-ding-en, ALLART, or ALBERT VAN (1621-75). A Dutch landscape and marine painter and engraver. He was born at Alkmaar and, according to a well-founded tradition, studied under Roelandt Savery at Utrecht and Pieter Molyn at Haarlem, where he chiefly resided until his removal to Amsterdam in 1657. In 1640-44 he visited Sweden and Norway, and his subsequent landscapes show the impression made on him by northern scenery. His pictures usually represent waterfalls with fir trees and rocks. His treatment is fresh, spirited, and truthful, his composition masterly, and his atmospheric effects excellent. The color in his landscapes is at times dark, but in his better works it is clear and warm. Hardly less notable are his rarer marines, of which the best is "A Snow-Storm on the Zuyder Zee," in the Musée Condé, Chantilly. The finest collections of his paintings are in Dresden, Munich, Amsterdam, and Copenhagen galleries and in the Louvre. At his best he equals Ruysdael, to whom his works are frequently attributed, although he is usually less versatile in execution and less profound in feeling. He left more than 160 known etchings of great variety and spirit. Fifty-seven of these illustrate the poem of *Reneke Fuchs*. The original drawings for this work, and also others by him, are in the British Museum. Consult Drugulin, *Allart van Everdingen, catalogue raisonné de toutes les estampes qui forment son œuvre gravé* (Leipzig, 1873), and Granberg, *Allart van Everdingen et ses paysages norwégiens* (Stockholm, 1902).

EVEREST, MOUNT. A mountain of the Himalaya system on the frontier of Nepal and Tibet, situated in lat. 27° 59' N. and long. 86° 55' E. (Map: India, F 3). It is the highest known mountain peak on the earth, being about 29,000 feet above sea level, or approximately

5½ English miles. It was named after Sir George Everest, a former surveyor-general of India. It has been much confused with Gaurisankar, which peak is more than 5000 feet lower.

EVEREST, SIR GEORGE (1790-1866). An English military engineer, born in Wales. He studied in the Royal Military Academy at Woolwich, England, became a second lieutenant in the Bengal artillery, and participated in a survey of Java and in engineering work on the Ganges. In 1818 he became assistant to Colonel Lambton in the trigonometrical survey of India, and on the chief's death in 1823 became his successor. In 1830 he became surveyor-general of India, and he discharged the duties of both offices until his retirement in 1843. He became a fellow of the Royal Society, was knighted in 1861, and served as vice president of the Royal Geographical Society in 1862. Mount Everest (q.v.) was named in his honor. He published *An Account of the Measurement of Two Sections of the Meridional Arc of India* (1847).

EVERETT. A city in Middlesex Co., Mass., 4 miles northeast of Boston (Map: Massachusetts, E 3). It is on the Mystic River, on the Boston and Maine Railroad, and has electric railroad connection with Boston, Chelsea, Lynn, Salem, and towns of the vicinity. Everett has a large number of manufacturing plants, the principal being chemical works, gas and coke works, structural iron foundries, steel works, and manufactories of radiators, shoes, coal-tar products, leather, beds, concrete blocks, tools, wagons, boxes, trunks, etc. There are two public libraries—the Parlin Memorial and Shute Memorial—and the Whidden Memorial Hospital. The government is administered, under the original city charter of 1892, by an annually elected mayor and a bicameral city council, of which the members of the upper house are elected for two years, one from each ward and one at large, and those of the lower by wards for one year. Of the other municipal officials the more important are nominated by the executive and confirmed by the board of aldermen, and those of less importance are chosen by the city council. One-third of the school board is elected at large, the remainder by wards. Pop., 1900, 24,336; 1910, 33,484; 1914 (U. S. est.), 37,381; 1920, 40,120. Everett was settled in 1643 and remained a part of the town of Malden till 1870. It was chartered as a city in 1892.

EVERETT. A city, port of entry, and the county seat of Snohomish Co., Wash., 33 miles north of Seattle, at the mouth of the Snohomish River, on Puget Sound, and on the Great Northern, the Northern Pacific, and the Chicago, Milwaukee, and St. Paul railroads, and on several lines of Sound and coasting freight and passenger steamboats (Map: Washington, C 2). It is in a rich lumbering, gardening, farming, and copper-gold-and-silver-mining district, and has a fine harbor with several large iron piers. The city trades extensively in lumber, having some of the largest plants in the northwest. Red-cedar shingles are the most important product. There are also ore, paper, and flour interests, and among the chief industrial establishments, large shipyards, paper and flour mills, ironworks, sash and door factories, saw and shingle mills, smelters, and one of the two plants in the United States for saving arsenic from smelter fumes. Everett contains the Pacific College (Lutheran), opened in 1908, a Carnegie

library, two hospitals, and the United States customs and assayer's offices. The city has adopted the commission form of government. Settled in 1891, and incorporated two years later, its growth has been rapid because of its favorable situation as a commercial port, its transportation facilities, and its nearness to extensive forests. Pop., 1900, 7838; 1910, 24,814; 1914 (U. S. est.), 32,048; 1920, 27,644.

EVERETT, ALEXANDER HILL (1792-1847). An American diplomatist and political writer. He was born in Boston, Mass., the son of the Rev. Oliver Everett, and brother of the orator Edward Everett. He graduated with highest honors at Harvard in 1806, was admitted to the bar, appointed United States chargé d'affaires at The Hague in 1818, and Minister at Madrid in 1825. Upon his return in 1829 he became proprietor and editor of the *North American Review* and was elected to the Massachusetts Legislature. In 1840 he was sent by the government to Cuba as confidential agent, and appointed in 1845 to a diplomatic post at Peking, a post which he held at his death. His literary activity began early. He made frequent contributions to the *Monthly Anthology* (1803-11). His first important book, *Europe, or a General Survey of the Political Situation of the Principal Powers, with Conjectures on their Future Prospects* (1822), was translated into German, French, and Spanish. A similar work on *America* appeared in 1827, having been preceded by *New Ideas on Population* (1822). Other books were *Critical and Miscellaneous Essays* (1845-47) and *Lives of Joseph Warren and Patrick Henry* in Sparks's *American Biography*. Frequent contributions, literary and political, to the *North American Review* and economic essays in the *Boston Quarterly* attest the unremitting labors of a busy life. He shared something of his brother's oratorical power, the more noteworthy of his published orations being "The French Revolution," "The Battle of New Orleans," and "The Battle of Bunker Hill."

EVERETT, CHARLES CARROLL (1829-1900). An American Unitarian clergyman and educator, born at Brunswick, Me. He graduated at Bowdoin College in 1850 and studied in Berlin in 1851-52. After teaching languages at Bowdoin College and being librarian there, he graduated at Harvard Divinity School (1859), and for 10 years was pastor of the Independent Congregational Church (Unitarian) at Bangor, Me. In 1869 he became Bussey professor of theology and in 1878 dean of Harvard Divinity School. In 1872 he began his lectures on East Asiatic religions, one of the earliest American courses on "comparative religion." His principal publications are: *The Science of Thought* (1869; rev. 1890); *Religions before Christianity* (1883; in Dutch version for school use); *Fichte's Science of Knowledge* (1884); *Poetry, Comedy, and Duty* (1888); *Ethics for Young People* (1891); *The Gospel of Paul* (1893); *Psychological Elements of Religious Faith* (1902); *Immortality and Other Essays* (1902); *Theism and Christian Faith* (1909). He was a founder and editor of the *New World*. Consult articles on Everett in the December, 1900, number of the *New World* by C. H. Toy, N. P. Gilman, and Josiah Royce.

EVERETT, EDWARD (1794-1865). An American statesman, orator, and scholar. He was born at Dorchester, Mass., April 11, 1794; was at one time a pupil in a Boston school of which

may not be filled with some sort of structural work. Excavation may vary from the simplest digging of a well or cellar for a rural dwelling to work involved in the construction of a ship-canal or railway terminal, tunnel subway, or subaqueous foundation. It may involve the use of pick and shovel or other hand tools, a horse-drawn plow or scraper, a steam shovel, or other forms of excavating machinery (q.v.) with or without the use of high explosives (see **BLASTING**), or various complicated dredging machinery. (See **DREDGE**.) Often it is a form of engineering where the element of human labor figures more prominently than elsewhere, as much of the work is done by hand, although this condition has been improved by recent forms of excavating machinery. The term *Excavation*, however, is so general a one that reference should be made to articles describing more important processes included under such titles as **CANALS**, **DAMS AND RESERVOIRS**, **EXCAVATING MACHINERY**, **FOUNDATIONS**, **TUNNELS**, **DREDGE**, **RAILWAYS**, ETC.

EXCELSIOR (Lat., higher). 1. The motto of the State of New York. 2. A widely known poem of Longfellow (1841), suggested by the motto of New York, and beginning "The shades of night were falling fast."

EXCELSIOR. A material formed of thin wood shavings, much used for packing purposes, stuffing for mattresses and upholstery, as stable and kennel bedding, and in France employed as a substitute for absorbent lint in hospitals, for filtration purposes, and for weaving into floor coverings. It was first made in the United States about the middle of the nineteenth century, being put on the market in 1860, but later the manufacture was extensively taken up in Europe, especially in France. Excelsior is not, as is often supposed, made from shavings, but directly from logs of wood. Aspen or poplar and basswood furnish the best material. The logs are first sawed into blocks, 19 inches long, 5 inches thick, and the width of the log. These bolts, or split billets, are seasoned, split in two 19-inch lengths, and the ends trimmed down to make the final bolt for the machinery 18 inches long, the usual length of a strip of excelsior. A knife shaves off the surface of the bolt, the slice first having been split by a series of scoring knives. The tiny fibres curl and commingle as they fall from the knife; the finer the shavings, the higher the grade of the product. An excelsior machine will make from 200 to 300 strokes a minute, each stroke cutting off a tier of fibres from the face of the block. Excelsior is packed in bales weighing 250 pounds. The annual production for the United States, amounting to some 140,000 tons, requires some 85,000,000 feet of timber, or the growth of over 14,000 acres of forest land. The American product in 1911 was manufactured by 122 factories, which consumed 142,944 cords of wood, of which 61,941 cords were cottonwood, 37,901 cords yellow pine, and 33,042 basswood. The price in 1914 varied from \$8 to \$22 per ton on the market according to the grade. It was said that it costs from \$7 to \$12 per ton to manufacture and market the product.

EXCELSIOR SPRINGS. A city in Clay Co., Mo., 28 miles northeast of Kansas City, on the Chicago, Milwaukee, and St. Paul, the Wabash, and the Kansas City, Clay County, and St. Joseph railroads (Map: Missouri, B 2). Its many mineral springs with medicinal properties

have made the city a popular health resort. There are several fine hotels and pavilions, a large auditorium, Carnegie library, and a government building. The city has also an ice factory and bottling works. Pop., 1900, 1881; 1910, 3900.

EXCEPTION (Lat. *exceptio*, from *excipere*, to except, from *ex*, out + *capere*, to take). In law: (a) a taking out or excluding something from the operation or effect of an instrument, statement, or the like; (b) an objection legally taken to testimony or other material matter in a legal proceeding; (c) the clause, writing, or statement by which either of these objects is accomplished, also the thing excepted or excepted to. When applied to a clause in a deed, it means a provision that exempts something from the grant, as where the deed conveys a certain farm with the exception of a described piece of land or a designated building or tree. (Cf. **RESEVATION**.) An exception in a statute exempts a person or thing from the operation of the enactment; and it is a rule of pleading in a criminal prosecution or in a civil suit for penalties under such a statute, that the indictment or complaint must negative the exception, i.e., deny that the defendant or the alleged criminal act comes within the exception. In admiralty and equity practice the term is applied to the proper method of bringing before the court an objection to the regularity or sufficiency of a pleading or proceeding. In this sense an exception partakes of the nature of a pleading, performing the function of a special demurrer at common law.

The term is employed most frequently, however, in common-law actions to describe the formal signification of a party's objection to an adverse ruling of the court upon some point of law. It must be taken at the time of the ruling, or within a prescribed period thereafter, and should be entered upon the court's record, so that a proper bill of exceptions (q.v.) may be prepared for a review of the case by an appellate court. Consult the authorities referred to under **REAL PROPERTY**; **PLEADING**; **PRACTICE**.

EXCESS (Lat. *excessus*, departure, from *excedere*, to depart, from *ex*, out + *cedere*, to go). The remainder arising from dividing one number by another is often called the excess, as in casting out nines in the test for divisibility. (See **CHECKING**.) In spherical trigonometry the excess of the sum of the angles of a spherical polygon over $n - 2$ straight angles (the sum of the angles of a plane polygon of the same number of sides) is called the spherical excess of the polygon; e.g., the spherical excess of a spherical triangle with the angles 90° , 127° , 40° , is 77° . When the area of a spherical triangle, compared with the area of the sphere on which it lies, is very small, it may be taken as the area of the plane triangle with sides of the same length as those of the spherical triangle and with angles diminished by one-third of the spherical excess. If S denotes the area of the spherical triangle, E its excess, and r the radius of the sphere, then

$$E = \frac{S}{r^2 \sin 1''}$$
 This formula is of use in triangulation (see **SURVEYING**) to check the excess as found from the observed angles.

EXCHANGE (OF. *exchanger*, *echanger*, Fr. *échanger*, It. *scambiare*, ML. *excambiare*, to exchange, from Lat. *ex*, out + *ML. cambiare*, Lat. *cambiare*, to change, from OIr. *cimb*, tribute; connected with Gall. *cambos*, Ir. *camm*, Welsh,

THE EVERGLADES

1. VIEW OF THE EVERGLADES WEST OF FORT LAUDERDALE, FLORIDA, LOOKING NORTH.
2. VIEW FROM THE SAME POINT, BUT LOOKING SOUTH.
3. DRAINAGE CANAL IN THE EVERGLADES WEST OF FORT LAUDERDALE, LOOKING WEST.

of a rim of this rock, which rises a foot or more above the level of the water. This level is from 16 to 20 feet above the sea. It is known, too, that, although there are many confusing cur-

EVERGLADES.

rents, the general movement of the water is consistently southward. These facts have long been appreciated, and prompted the belief many years ago that the Everglades could be reclaimed. In 1845 the Legislature of Florida memorialized Congress on this subject, and in 1847 the Secretary of the Treasury, R. J. Walker, appointed Buckingham Smith to report to him his opinion of the feasibility of the plan. In 1850 Congress passed the Arkansas Act, or Swamp and Overflowed Land Grant Act, under which virtually all of the Everglades were patented to the State of Florida; and in 1855 Florida passed an Act creating the Trustees of the Internal Improvement Fund to promote the reclamation project. In 1881 a private company undertook to build a drainage canal from Lake Okechobee to the Caloosahatchee River, but the work was not well planned and did not succeed. In 1906 the State adopted a fairly definite plan, and the actual work was begun. The plan provided for a series of main canals, to be dredged from the coast to Lake Okechobee, the object being to lower the level of the lake by about 2 feet, to prevent the overflow of its waters into the Everglades once the water level there had been lowered by these canals. In 1913 five such canals had been completed, and several others had been recommended for construction. The feasibility of actually draining the greater part if not virtually all of the Everglades has been admitted by several expert engineers, and rich crops of sugar cane and garden truck have been grown upon some of the land thus reclaimed. There is, however, difference of opinion as to whether all of the land thus reclaimed will be valuable for agricultural purposes. See DRAINAGE.

Apparently the first white man to enter the Everglades was a Spaniard, Escalante de Fontenada, who, after being shipwrecked in the Straits of Florida, was taken prisoner and made a slave by the powerful cacique, Calos, known as the Lord of the Everglades. The only other human beings known to have made their home in these fastnesses are the remnant of the Seminole Indians (q.v.) who fled hither after the virtual subjugation of their tribe in 1842. Several expeditions have traversed or explored parts of the Everglades, the more important being those of Major A. P. Williams in 1883, J. E. Ingraham in 1892 (the first actually to cross the great marsh lake), and Lieut. Hugh L. Willoughby in 1897. Considerable literature about this mysterious region has been produced. For the various acts, reports, and other official papers relating to the reclamation scheme, and including much information concerning the region, consult *The Everglades of Florida*, Senate Document No. 89, 62d Congress, 1st Session (Washington, 1911), for progress of the work up to 1914, *Florida Everglades*, Report of the Florida Everglades Engineering Commission, Senate Document No. 379, 63d Congress, 2d Session (ib., 1914), and for a readable description of the country, Lieutenant Willoughby's account of his expedition, *Across the Everglades* (Philadelphia, 1898). Rhodes and Dumont in *A Guide to Florida* (New York, 1912) present a good brief description; and of the numerous magazine articles the following are especially worthy of notice: Dix and MacGonigle, "The Everglades of Florida," in the *Century Magazine*, vol. lxxix (February, 1905); Willey, "Reclaiming the Everglades," in *Cassier's Magazine*, vol. xxxix (March, 1911); id., "Draining the Everglades," in the *Scientific American*, vol. civ, No. 2 (Jan. 21, 1911); and Dimock, "The Passing of a Wilderness," in *Scribner's Magazine*, vol. xli (March, 1907).

EVERGREEN. A town and the county seat of Conecuh Co., Ala., 99 miles east-northeast of Mobile, on the Louisville and Nashville Railroad (Map: Alabama, C 4). It is a winter resort, noted for its mineral springs, and has the Second Congressional District Agricultural School and Experiment Station and the State Baptist Orphanage. The town is interested chiefly in agriculture, lumbering, and market gardening, and contains a veneer mill, box factory, and saw mill. The water works and electric-light plant are owned by the municipality. Pop., 1900, 1277; 1910, 1582.

EVERGREEN. A plant which retains its foliage organs throughout the year. Evergreens contrast naturally with deciduous trees. These latter shed their leaves periodically and are leafless for some portion of the year; whereas the leaves of evergreens are more persistent and are either not shed periodically or the old leaves are retained until after the new ones have expanded. The term "evergreen" is used particularly in the case of trees, and the forests of the world are subdivided into various ecological groups, the basis for which is the nature of the foliage, whether deciduous or evergreen. Evergreen forests are again subdivided into the northern or conifer types, the sclerophyll or winter-rain type, and the tropical type in regions whose atmosphere is always moist. In the last type all gradations are to be found between the deciduous and the evergreen habit. See FOREST; LEAF.

EVERHART, BENJAMIN MATLACK (1818-1904). An American author and botanist. He was born near Westchester, Chester Co., Pa., and spent the first 40 years of his life in mercantile pursuits. In 1867 he retired from business and devoted himself to botanical research and to gathering and arranging a great collection of fungi, comprising thousands of specimens. He discovered nearly 300 new species of lichens, mosses, and liverworts, and became known as one of the greatest authorities in this branch of botanical science. In association with J. B. Ellis he founded the *Journal of Mycology*, the publication of which was subsequently taken up by the United States government. Nine plants have been named in his honor. His principal publications are *Ellis's North American Fungi*, and *The North American Pyrenomyces*, with original illustrations by W. F. Anderson (1892), a valuable monograph.

EVERLASTING FLOWER. A name given to various flowers, among which are certain species of *Amaranthus* (q.v.) and of *Helichrysum*. See IMMORTELE. See Plate of GOLDENROD.

EVERLASTING GOSPEL. See JOACHIM OF FLORIS.

EVERLASTING PEA. See LATHYRUS.

EVERMANN, BARTON WARREN (1853-). An American ichthyologist, born in Monroe Co., Iowa. He graduated from Indiana University in 1886. After serving for 10 years as teacher and superintendent of schools in Indiana and California, he was professor of biology at the Indiana State Normal School in 1886-91. Entering the service of the United States Bureau of Fisheries in 1888, he became ichthyologist in 1891, had charge of the division of scientific inquiry in 1903-11, and from 1910 to 1914 was chief of the Alaska Fisheries Service. He lectured at Stanford University in 1893-94, at Cornell in 1900-03, and at Yale in 1903-06. He was also United States fur-seal commissioner in 1892 and became chairman of the fur-seal board in 1908. His publications include bulletins and reports of the United States Fish Commission and contributions to the proceedings of various societies.

EVERSLEY, CHARLES SHAW-LEFEVRE, VISCOUNT (1794-1888). An English politician. He was born in London, was educated at Trinity College, Cambridge, was called to the bar in 1819, and entered Parliament in 1830, where he became a steady supporter of the Whig government. He was Speaker of the House of Commons from 1839 to 1857, when he was retired on a pension and made a peer. He served longer than any previous Speaker save Arthur Onslow, who held the office nearly 34 years.

EVERSLEY, GEORGE JOHN SHAW-LEFEVRE, FIRST BARON. See SHAW-LEFEVRE.

EVERY MAN IN HIS HUMOUR. Jonson's first extant comedy, produced at the Globe in 1598, Shakespeare himself taking a part, and printed in 1601. It proved the most vital of Jonson's plays. Garrick, after revising the piece, played the part of Kiteley with great success.

EVERY MAN OUT OF HIS HUMOUR. "A Comical Satyre," by Ben Jonson, produced in 1599 and published in 1600.

EVESHAM, evz'am, originally EOVESHAM. A municipal borough and market town in Worcestershire, England, on the right bank of the navigable Avon, 15 miles southeast of Worcester (Map: England, E 4). It lies in a beautiful and fertile vale and has for many years

been noted for market gardening. It is well built and lighted by gas. The gas works and water supply are owned by the municipality, which also maintains baths and washhouses, public recreation grounds, two public halls, and a public library. It has a grammar school founded in 1546 and a free public school. It has manufactures of gloves and hosiery. An abbey was founded here about 700, of which nothing remains but a fine tower and gateway. The town had its first charter in 1604 from James I. It was the scene of Simon de Montfort's defeat by the royal troops Aug. 4, 1265, terminating the Barons' War. Pop., 1901, 7101; 1911, 8341. Consult New, *A Day at Evesham* (Evesham, 1881), and id., *Evesham* (London, 1905).

EVET. See EFT.

EVIC'TION (Lat. *evictio*, from *evictus*, p.p. of *evincere*, from *ex*, out + *vincere*, to conquer). The expulsion or removal of a tenant from the possession of real property either by his landlord or by another acting under a paramount title. The term was formerly confined to dispossession by legal process, but it is now applied to every form of dispossession under a title superior to that of the person evicted. Disturbance of possession by a stranger, i.e., by one having no title to the lands in question, is not an eviction, but a trespass, punishable by a tort action. An eviction, on the other hand, whether rightful or wrongful, is not a trespass and is not punishable as for a wrong. Its effect is confined to the dissolution or modification of the relation of landlord and tenant between the lessor and lessee.

An eviction by a landlord of a tenant at will or at sufferance, or of a tenant who has forfeited his estate by the commission of waste, or by the breach of any condition on which the lease depended, is the normal and proper mode of terminating the relation between the parties. The eviction operates *ipso facto* to determine the tenancy. A similar act of dispossession of one wrongfully in possession of property by the rightful owner is not an eviction, but is more properly described as a reentry. (See ENTRY, RIGHT OF.) When, however, the person so in possession claims under a lease from a third person, the process may, from his standpoint and in relation to his landlord, be an eviction. Its effect is to terminate the lease and to set the tenant free from his obligations to his landlord. It is an eviction by paramount title. If the eviction in this case be only partial, however, i.e., from part and not the whole of the premises, the tenant may still be liable to his landlord for so much of the premises as remains in his possession.

On the other hand, if the tenant be unlawfully evicted by his landlord, it is immaterial whether the eviction be total or partial. A lease of land carries with it an implied covenant for the quiet enjoyment of the demised premises (i.e., a covenant that the tenant shall not be disturbed by an unlawful eviction by his landlord or by paramount title), and rests upon the condition that this covenant shall be observed. Any willful eviction from any part of the premises by the landlord's act is a breach of this condition and entitles the tenant to avoid the lease and refuse to pay rent, even though his possession of part of the premises is undisturbed. In this case, however, if the tenant remain in possession of a part of the premises, the rent is only suspended, and he may become liable under the lease again,

if he is restored to the part from which he has been evicted.

Strictly speaking, eviction involves the notion of an actual forcible removal or exclusion from the premises held by a tenant, and at common law nothing less than this would protect him against the claims of his landlord under the lease. This rigid rule has been modified in two particulars in certain of the United States. In Massachusetts and a few other States it has been held that when the premises are claimed by paramount title the tenant is not bound to await a forcible removal, but may yield to a demand for possession made on the premises. In New York it has been held that the landlord may effect an unlawful eviction, and thus release his tenant from his obligations under the lease, without any physical interference, by the process known as a "constructive eviction." This consists of a nuisance willfully maintained by the landlord, either upon or in close proximity to the tenant's premises, of such a character as to deprive the tenant of his rightful enjoyment of them and force him to abandon them. This doctrine has also been applied to a variety of acts or omissions by a landlord which do not come under the ordinary description of a nuisance, such as the refusal of the proprietor of an apartment house to furnish the heat or the elevator service stipulated in the lease. The courts have, upon the contrary, refused to carry the principle to the extent of permitting a tenant to claim a constructive eviction and abandon the premises because of the landlord's failure to make promised repairs, even though the premises are rendered untenable by such failure.

The rights accruing to a tenant under an eviction may usually be supplemented by a right of action against the landlord for damages, and the tenant may recover under the covenant of quiet enjoyment from the lessor the damages sustained by him as the result of the breach. See *LANDLORD AND TENANT*, and the authorities there cited.

EVIDENCE. The means by which the truth or untruth of any relevant fact is established in the trial of an action at law. What is and what is not legal evidence is determined primarily by the pleadings in the action. The early common-law system of pleading was so devised as to narrow down all matters of dispute between the plaintiff and defendant to a single issue of law or fact. If the issue was one of law, a question was raised for the court only; but if the issue was one of fact, a question was raised for determination by a common-law jury, after a trial in which evidence was introduced on the one side to prove the alleged fact and on the other to disprove it. The whole system presupposed, on the part of the jury, inability to consider more than one issue of fact at a time, and in the consideration of that one issue, to some extent, lack of capacity to give to different classes of logically relevant evidence their proper weight. It is to the historical development of the jury system, therefore, that many rules of the law of evidence may be attributed, which now seem to be unwarranted in logic and unsuited to the times.

Modern systems of pleading permit the raising of numerous issues of fact and have thus imposed on the jury duties requiring a higher standard of intelligence than under the ancient system. The rules of evidence, however, partly because they have been found to be practically sufficient and partly because of the necessity of

fixed and definite rules in the branch of the law, have not undergone a corresponding change, and many matters of evidence logically relevant and of considerable probative force are still not legally admissible evidence because of their supposed tendency to "confuse and mislead the jury."

I. Relevancy. The rule of first importance in the law of evidence is that it must be relevant in order to be legally admissible. Relevancy depends directly or indirectly on the issue raised by the pleadings. Thus, evidence of a fact may be relevant because it tends directly or indirectly to prove or disprove the fact in issue that is affirmed by one side and denied by the other; or because it tends to prove or disprove some matter of evidence already introduced by the other side. But, as has been pointed out, not all logically relevant evidence is legal evidence. Thus, evidence which is logically relevant may not be legally admissible because: (a) Its relevancy is slight or remote. Thus, evidence that the defendant was insolvent at a certain time is not admissible to prove that he borrowed money of the plaintiff at that time. (b) The evidence is of collateral transactions, or (as is sometimes said) *res inter alios acta*. Thus, in an action to recover damages for negligence it is not permissible to show that the defendant was negligent towards others than the plaintiff, or on trial of a defendant for stealing, that he stole from others. The general rule is, however, subject to many limitations and modifications more or less arbitrary. Thus, it is permissible to show, in an action of tort, brought to recover for injuries caused by a defective appliance belonging to the defendant, that others were injured by it in a similar manner, and, generally, value of land may be shown by proving the selling price of other land similarly situated. The character of a party to a civil action is not regarded as relevant and is therefore not the subject of evidence unless the character is directly put in issue by the pleadings, as in an action for libel. In a criminal trial, however, the defendant may, if he so elects, introduce evidence of his character, which evidence the prosecution may then rebut.

II. Hearsay. What others than the witness have said before the trial is not generally admissible in evidence because not sworn to and because not subject to cross-examination. This rule, known as the "hearsay-evidence rule," is subject to several exceptions, the most important of which are the following:

(a) *Admissions and Confessions.*—Statements, either oral or written, made at any time by a party to an action or by his predecessor in interest, may be introduced in evidence against him, but not by him or in his favor. The rule is based upon the inherent truth of statements which are prejudicial to the interests of the party making them. Under the rule as to predecessor in interest, the admissions of a deceased person are admissible in evidence in actions against his executor, or admissions as to the title of real estate made by its then owner are admissible in an action founded upon the title brought against his subsequent grantor. Admissions made by an agent within the scope of his authority are admissible in evidence against the principal. Confessions are strictly admissions made by one charged with a crime, and, because of the necessity of safeguarding one charged with a crime, are not admissible when ob-

tained by means of threats or promises of favor. This rule has been extended or restricted by statute in many of the States.

(b) *Reported Testimony in a Prior Trial.*—In general the testimony of a witness in an earlier trial between the same parties and relating to the same issues, or between parties identical in interest with the parties at the present trial, may be introduced in evidence if the witness is dead, insane, unable to attend the trial, out of the jurisdiction, or kept from appearing at the trial by an opposing party. The testimony in the earlier trial must have been sworn to and subject to cross-examination, thus obviating the usual objection to hearsay evidence.

(c) *Dying Declaration.*—Declarations made by a person in *extremis* are admitted in evidence upon the trial of one charged with the homicide of the declarant, either in favor of the prosecution or the prisoner. See DECLARATION, DYING.

(d) *Declarations against Interest.*—These are admissions in any form against financial or proprietary interest of the person making them and made by one who at the time of trial is dead. Unlike admissions, they need not be made by one having some connection with the party to the action. Thus, an indorsement written on a note by the holder that a part of the note is paid, or a book entry that a bill has been paid, or a statement that the declarant is a tenant (rather than the owner), are all admissions against financial or proprietary interest, and are admissible in evidence if relevant and if the declarant be dead.

(e) *Book Entries.*—Book entries or reports made pursuant to a legal duty or in the usual course of business by one since deceased having personal knowledge of the matter so entered or reported are admissible in evidence to prove the truth of matters contained in the entry. Thus, the book entries of clerks or written reports of officers are admissible in evidence under this head, but not the entries in a diary, because not made pursuant to a duty. Closely related to the rule as to entries made in the course of business is the so-called shop-book rule. This rule varies considerably in different jurisdictions, but the effect in all is substantially to allow a party to an action, although present at the trial in person, to prove an account by introducing in evidence his book of account. He is usually required to make preliminary proof that he is engaged in the business in which the charges in the book are made, and that he has made correct entries. A witness may always be allowed to refresh his memory by referring to memoranda or book entries; in that case the memoranda or book entries are, however, not directly in evidence, and the jury may rely only upon the witness's oral testimony.

(f) *Res Gestæ.*—Any statement made at the time of the happening of an event by one who was then present may be introduced when the event itself is in issue or relevant. Such evidence is admitted on the theory that the statement is incidental to the event itself and to some extent characterizes or explains it. Thus, on a murder trial it is proper to prove a statement made at the time of the homicide by any person present, which tended to show that the defendant committed the homicide or that the act was intentional or malicious.

III. Real Evidence, Writings. Legal evidence is not limited to the sworn testimony of witnesses. Specific objects, when properly identi-

fied by oral testimony, may often be introduced in evidence when their very existence or their character or appearance tends to prove or disprove an alleged fact. Thus models, parts of machinery, weapons, clothing, etc., may be introduced in evidence. Such evidence cannot of course be submitted to an appellate court as a part of the record of the trial, and for that reason the extent to which such evidence may be received may be limited by the discretion of the court, and in some jurisdictions practically no such evidence is admitted. Writings or documents may generally be introduced directly in evidence for the purpose of proving the truth of statements contained in them. At common law documents purporting to be more than 30 years old required no particular authentication, or, as was said, such documents proved themselves. The execution of other documents must, however, be proved by the sworn testimony of a witness to the execution, or, if he be dead, by proof of the handwriting of the person who executed the document.

The so-called best-evidence rule applies to documentary evidence. Briefly stated, it is that the best evidence of the contents of a document is the document itself, and that no other evidence of the contents of a written instrument is admissible. This rule is subject to many exceptions, real or apparent. Thus: (a) Where the original document is in duplicate form any one of the duplicates may be introduced in evidence as an original. (b) Secondary evidence (i.e., a copy or oral testimony) of a written notice is admissible. (c) Matters of public record may be proven by secondary evidence, in most jurisdictions by a certified copy of the record. (d) Secondary evidence may also be introduced to prove an instrument which has been lost or destroyed, or whenever the other party to an action, having the document in his possession, fails to produce it at the trial for the purpose of preventing its being introduced in evidence on due notice. One who has willfully destroyed a document will not, however, be allowed to give evidence of its contents. The common-law rule as to proof of documents has been much modified by statute. In most jurisdictions all documents attested before a notary or corresponding officer are *prima facie* admissible in evidence if relevant.

IV. The Parol-Evidence Rule. This is properly a rule of substantive law which is, in effect, that the terms of a contract or other legal instrument should be deemed to be embodied wholly in the written instrument executed by the parties thereto, or, stated in terms of evidence, the rule is that parol or oral evidence shall not be introduced for the purpose of varying the terms of a written instrument. The rule, though necessarily subject to many exceptions, is founded upon the just notion that, when parties have deliberately embodied their agreement or transactions in writing, they should not thereafter be allowed to dispute its terms. The following are the most important cases in which evidence to vary the express terms of a written instrument may be given:

(a) Where the parties did not intend to reduce all the terms of the agreement to writing.

(b) When the writing or agreement is varied by a subsequent parol agreement.

(c) When the evidence is introduced to show that the written instrument has never taken effect because of the nonoccurrence of some agreed condition precedent.

(d) When a term of the instrument is ambiguous and parol evidence is necessary to explain the meaning, and upon analogous grounds where the term of a written instrument has a technical or local meaning requiring oral explanation.

(e) When the proof of a custom which is in law a part of a contract or other document varies the effect or meaning of the written language.

(f) When in equity an action is brought to reform or rescind a written instrument, or construe a conveyance as a mortgage.

V. **Opinion Evidence.** In general witnesses are allowed to testify only as to facts, and not as to their inferences or opinions based upon facts within their knowledge. To permit the witness to indulge in opinion testimony would be a usurpation of the function of the jury, whose duty it is to draw inferences of fact and to form an opinion, where an opinion is necessary to the verdict. Thus, the witness, when the facts of a conversation are in issue, must testify as to the terms of the conversation and not his conclusions as to its meaning. There are, however, three important exceptions to the rule that opinion evidence is inadmissible. They are: (a) Matters of common experience; matters of common knowledge to a certain extent the result of inference. Thus, to testify that a certain day was cold, or that a knife was sharp, involves the operation of the witness's mind in drawing a conclusion; but since these are matters of common experience about which the conclusions of the witness are as trustworthy as those of a jury, such testimony is legally admissible as evidence. (b) Matters not of common experience, but about which the opinion of the witness is under the circumstances more trustworthy than any which could be formed by the jury. Thus, a witness may be so situated with reference to an event or combination of circumstances as to be able to draw a more accurate conclusion from them than the jury, which should rely wholly upon verbal testimony about the occurrence. Thus, the witness may be allowed to give his opinion of the distance between an approaching street car and a pedestrian before warning of the approach was given; or, under certain circumstances, he may be allowed to give his opinion of the rate of speed at which the car was moving. His presence at the time of the event enables him to form a more accurate opinion than the jury, which can only rely upon a necessarily imperfect description of the occurrence. (c) Expert testimony. A witness may be allowed to testify as to his opinion because, by reason of experience or special study and investigation, he is better qualified to form an opinion than the jury. Thus, physicians, engineers, handwriting experts, etc., are allowed to give opinion evidence in order to aid the jury in reaching a correct conclusion. They are not allowed, however, to express any opinion as to the truth or untruth of other evidence submitted to the jury, that being a matter of which the jury is qualified to judge. The testimony of experts, so far as it is opinion evidence, is based upon the evidence already before the jury, assuming it or parts of it to be true. For that reason questions asked of expert witnesses are usually required to be hypothetical in form.

VI. **Witnesses' Competency.** A witness is not competent to testify until he has taken oath to testify truly. At common law an atheist or other unbeliever in the Christian religion was not a competent witness, because it was believed

that he would not feel constrained by his oath to testify truly. At the present time a witness is generally allowed to testify on his oath or affirmation, no particular religious belief being requisite. A child is a competent witness if old enough to understand the nature and obligation of an oath, and an insane person may testify upon a matter concerning which his understanding is not affected by his insanity. At common law one convicted of a felony within the jurisdiction was incompetent as a witness unless pardoned. In most jurisdictions such a conviction now affects the credibility only, and not the competency of the witness. At common law a party to an action was not a competent witness in his own behalf, nor was one a competent witness if directly interested in the controversy. This disability has been generally removed by statute. Nor could either the husband or wife testify for or against the other at common law. This disability has been removed to some extent by statute in most jurisdictions, but not generally so as to permit testimony as to confidential communications between husband and wife.

It was the policy of the common law to protect the witness from being compelled to incriminate himself. He is therefore privileged from giving any testimony which tends to incriminate him or to subject him to a penalty or forfeiture. If the witness does not claim his privilege, his testimony is competent and subject to the usual rules of the law of evidence. Having once fairly waived his privilege, he must testify fully. Thus, a defendant in a criminal trial is privileged from being compelled to testify; but having offered to testify in his own behalf, he must answer proper questions directed to him on cross-examination. At common law, also, an attorney and client were privileged from testifying as to any confidential communication between them. By statute this privilege has in most jurisdictions been extended to persons standing in other confidential relationships, e.g., physician and patient, clergyman or priest and layman, and in some jurisdictions, notably New York, attorneys, physicians, and clergymen are not competent to testify as to confidential communications received by them in their professional capacity. Upon the similar ground of public policy a party is privileged from testifying as to his efforts or willingness to compromise the matter in controversy, and it is probable that the President of the United States and the governors of States are privileged from appearing as witnesses under any circumstances.

VII. **Examination of Witnesses.** Witnesses may be classified as favorable or opposing. A favorable witness is one called by a party to testify in support of his contention in the controversy, and an opposing witness is one called by the other party to the controversy to testify in his behalf. The favorable witness on one side is therefore the opposing witness of the other. As a general rule, one is not allowed to ask his own (or favorable) witness leading questions, i.e., questions which by their form indicate the answer desired. The extent to which leading questions may be asked, however, rests in the discretion of the trial judge, and should the witness prove hostile leading questions may be asked. One may not impeach the credibility of his own witness, i.e., he is not allowed to introduce testimony to show generally that the witness is not worthy of belief. He may, however, contradict the testimony of the wit-

ness by other witnesses for the purpose of showing the truth as to a fact about which the first witness has testified. At the close of the direct examination, or the examination of a favorable witness, counsel for the other side may cross-examine, i.e., may examine him as an opposing witness. On cross-examinations it is permissible to ask leading questions. The cross-examiner may also attack the credibility of the witness, and for that purpose may ask questions not otherwise relevant. The credibility of an opposing witness may also be attacked by introducing testimony to show that he is generally unworthy of belief.

The Burden of Proof. From the nature of pleading and the trial of an action at law it follows that upon one party or the other to the controversy rests the burden of introducing some evidence in order to establish his contention. The burden of proof is said to rest upon the party against whom a judgment must be given if no evidence be introduced in his favor. The same doctrine is stated in slightly different terms by saying that the burden of proving a fact rests upon him who asserts the existence of the fact in his pleading, and not on him who denies it. The party on whom the burden rests may, by the introduction of some evidence, make out a *prima facie* case, and then arises the legal necessity for the other party to introduce evidence enough to destroy the *prima facie* case of his opponent. Thus, at various stages of the trial the burden of introducing evidence may shift from one side to the other. It is evident, therefore, that the common expression that the burden of proof shifts during the progress of a trial is not exact, unless the word "proof" be taken in the sense of attempt to establish the truth of a fact, and not in its usual legal sense as such evidence as satisfies the mind. In civil trials the party on whom rests the burden of proof must sustain his case by the preponderance of evidence. In criminal trials the burden of proof rests upon the prosecution, which is required to prove its case beyond a reasonable doubt. In sustaining the burden of proof the party upon whom the burden rests is aided in making proof by the doctrines of judicial notice and of presumption. It is unnecessary to prove facts of which the court will take judicial notice. In general these are facts of such common and universal knowledge that it would be idle to prove them by affirmative testimony. Thus (to cite a few of the innumerable cases), it is unnecessary to prove the calendar, the multiplication table, that water will freeze, or that ice will melt. The party sustaining the burden of proof is also aided in making proof by proving one fact or set of facts from which certain consequences are presumed to flow. (See **PRESUMPTION**.) All so-called circumstantial evidence is intended to create a presumption of some other fact sought to be proven.

In general courts of equity follow the rules of evidence as adopted by the common-law courts.

In the United States the Federal courts in civil cases usually follow rules of evidence applied by the local State courts. In criminal trials they follow the common law as interpreted by the Federal courts and as modified by Federal statutes. In the several States the common-law rules of evidence are generally followed with comparatively few statutory modifications. EVIDENCES OF CHRISTIANITY. A term often used as the equivalent of apologetics. (See **APOLOGY**.) Sometimes apologetics is used in the wider meaning of a systematic statement of the nature of Christianity and its place in the human development, so framed as to meet the objections which have been raised against it, while the evidences of Christianity is kept for a narrower and more specific answer to current objections. The evidences most effective in any age or portion of the Church depend upon the conception of Christianity emphasized, and the nature of the objections to be met. Since Christianity has been conceived differently in different ages, the evidences presented have also differed. In the first period of its history, represented by the writers of the New Testament, Christianity was the belief that Jesus was the Jewish Messiah foretold by the prophets and that He would come again to inaugurate the messianic kingdom. The evidences consisted largely in the attempt to prove that Jesus fulfilled the messianic predictions of the Old Testament; to which Paul added that the Old Testament also looked forward to the extension of the work of the Messiah to the Gentile world (Matthew, Hebrews, Paul's letters). As Christianity entered the Gentile world, it met a new field of thought, demanding new evidences. Aside from answers to the slanders against the moral life of the Christians, two kinds of evidence were demanded—that which met the popular polytheism and that which met the Greek philosophy. In time the Christian apologists passed from the defensive to the offensive. They attempted to show that idolatry was absurd; that a revelation by the Creator was reasonable; that Christianity was foreshadowed by the Greek philosophy as well as by the Hebrew prophets; and that its moral results in the lives of its adherents proved its divine origin. Most of the Church fathers contributed to the body of evidences, notably Justin Martyr, Aristides, Tertullian, Clement (*Stromateis*), Origen (*Against Celsus*), Arnobius, Cyril of Alexandria (*Against Julian*), Eusebius (*Præparatio Evangelica*), Augustine (*De Civitate Dei*). After the fall of paganism the evidences lose their practical character and become philosophical defenses of the current theology. Such are Anselm's *Monologion* and *Proslogion*, and Abelard's *Dialogue between a Jew and a Christian*. After the Reformation philosophy was freed from the trammels of the Church, an active and aggressive skepticism arose, and the evidences of Christianity once more became vital. In Germany, France, and England rationalism and deism (q.v.) arose in the seventeenth century, denying revelation and affirming the sufficiency of natural religion. This was an attack upon the current conception of Christianity as a miraculous revelation presenting the only adequate knowledge of God which man possesses, and the evidences which it called forth were concerned with a defense of supernatural revelation. Deism admitted the existence of God and the fact of sin and judgment. In a work which

has become a classic in theology, *The Analogy of Religion, Natural and Revealed, to the Course and Constitution of Nature* (1736), Bishop Butler used these admissions as the basis for an argument that revealed religion follows directly from natural religion. In the eighteenth century David Hume (q.v.) attacked the credibility of miracles, appeal to which had been the chief defense of the supernatural character of Christianity. The most famous reply was Paley's *View of the Evidences of Christianity* (1794). His argument was that the Apostles must be regarded as credible witnesses to the miracles, since they endured suffering and persecution solely because they believed that certain miraculous events had taken place. During the nineteenth century the problem of the supernatural was approached from another standpoint, and positivism, agnosticism, and skepticism were met by a theistic view of the universe. Meantime the argument from experience, though playing no great part in the classic works of the English apologists, had been developed, especially by the mystics. The greatest statement of this argument is Pascal's *Pensées*.

The books of Evidences which present the classic argument usually gather up the various lines of proof used in the different periods of history and present them in systematic order. 1. A personal God is the creator and governor of the universe. This presents the Christian theory of the universe as over against the pantheistic or materialistic theory. 2. God has made a revelation of Himself to man through nature and through the Hebrew religion. 3. These revelations were imperfect, and are perfected by the revelation through Christ. This revelation, attested by miracles, consists of His teaching regarding God as the Father of men, His perfect life of obedience to God, and His death and resurrection, by which God assures man of His love and readiness to forgive. 4. The testimony of the Apostles and Paul confirms the revelation of Christ. 5. The moral superiority of Christianity is shown by its triumph over paganism and by the moral progress of Christian civilization. 6. Individual experience shows that Christianity brings satisfaction for religious needs, and the sense of communion with God. The argument from experience, while it cannot be made a compelling proof to the unbeliever, has always been claimed as a satisfactory and complete argument to the believer.

The older Evidences contain much which is aside from present thought. The discussion has moved to other fields and needs other arguments. The older argument was adapted to a view of the world which drew a sharp distinction between nature and the supernatural. Christianity was regarded as a supernatural revelation breaking into the mechanical realm of nature. It was miraculous in content and depended chiefly upon miracles to prove its supernatural character. The content of the revelation was regarded largely as a philosophical system, belief in which was held to be necessary. The present view of the world draws no such sharp distinction between nature and the supernatural. Nature itself is the unfolding of the purpose of God, and revelation comes in it rather than breaks violently into it from without. A greater appreciation of the human elements in the Bible has made it possible to offer other explanations of some of the narratives of miracles than those formerly given. Comparative religion has

shifted the ground from the problem of the abstract truth of Christianity to that of its practical value. The present question is, Does Christianity meet the religious and ethical needs of humanity better than do other religions? The problem is no longer philosophical, but practical, and the grounds of the evidence must shift accordingly. The evidences which meet the needs of the present day concern themselves chiefly with the teaching of Jesus. They try to show that His central principle of love to God and to man is (1) the highest possible ethical and religious ideal, for perfect love would be perfect harmony with the God of love. This makes Christianity the perfect religion, for none can claim a higher ideal without destroying the independence of personality. (2) When embodied in conduct, it becomes the perfect ideal of ethics. It adapts itself to all phases of civilization. The goal which Christianity sets, the kingdom of God, satisfies the highest social longings of humanity, for it is the ideal of a society in which the absolute righteousness shall rule. The religion is capable of infinite progress, for it is a religion of principles, not of precepts; and the principles of love and righteousness can never be superseded, but may be applied through any conceivable future history with ever-increasing success. These ideals are exemplified in the character of Jesus. He Himself lived His own religion; and Christianity claims that His character remains in history as the type towards which all characters should approach. The evidence which appeals to the present day attempts to show that Christianity is both the highest and the most practical religion which history offers to man. It cares less for miracle than did the older Evidences, and more for life.

EVIL (AS. *yfl*, Goth. *uþils*, OHG. *uþil*, Ger. *übel*, evil; probably connected with Goth. *ufar*, OHG. *ubar*, Ger. *über*, AS. *ofar*, Eng. *over*, Lat. *super*, Gk. *υπερ*, *hyper*, Skt. *upari*, over). Evil may be generally defined as frustrated desire, or the cause or causes of frustrated desire. If a being had no wants, no desires, no aspirations, for that being nothing could be an evil. His own destruction would be a matter of absolute indifference, and all his experiences would be mere colorless events. It is often said that for science there is no evil in the universe. But this statement presupposes that all is law and order in the universe, and that this uniformity of law in nature is what man as an intellectual

being desires. For a being that wishes to know, ignorance and all causes of ignorance are evil; and chaos would be an insuperable bar to knowledge, hence would be an evil. The law-abidingness of nature makes knowledge possible, hence is for an intelligent being good. But man has other desires than curiosity to know. And whatever thwarts any of these desires is so far evil. Evil is absence of food for the hungry, lack of water for the thirsty, rebuff for the lover, disappointment for the ambitious, death for him who is filled with a lust for life, and life for him who is weary of it. To the person, therefore, who inquires why there is evil in the world the answer given must be: "Because in the world there are beings possessed of desire, and not possessed of the means to satisfy desire." This was the great insight of Gautama the Buddha. His practical conclusion was to secure the suppression of desire. Another equally justified conclusion would be the social ordering of life so that in general satisfaction may be obtained. We have thus opposed to each other the ideal of self-repression and that of self-realization. Usually the question has reference to moral evil. But, as an evil, moral evil differs no whit from any other evil. It is an unsatisfied desire or its cause. When the evil is moral, the unsatisfied desire is for a moral order. (For a discussion of the question what morality and moral order are, see ETHICS.) What makes moral evil more serious than other evils is the fact that common human interests are more intimately and more extensively concerned in the moral order than in anything else.

Many theological and philosophical answers have been given to the question as to the origin of evil. Thus, the dualism of Zoroaster maintains that evil arises from the action of Ahri-man in his ceaseless antagonism to Ormazd. (See AVESTA; ZOROASTER; MANICHEISM; GNOSTICISM.) Traditional Christian theology traces human evil to the fall of Adam and Eve, which, according to the account in Genesis, was brought about by the agency of the serpent. In accordance with later Hebrew tradition the serpent was regarded as representing Satan, the personal principle of evil in the universe. Satan differs from Ahri-man in not being coordinate with the principle of good. This opens the question of the relation between Satan and God, which has furnished opportunity for many a theological controversy. Again, many philosophers and theologians give a rationalistic account of the origin of evil by saying that it is a metaphysical counterpart of good; that it is as impossible to conceive good without evil as it is to conceive an inside without an outside. Others again make evil a necessary result of finitude; whatever is limited is ipso facto evil. Most of the puzzles connected with the problem of evil are theological rather than scientific, i.e., it is by reason of the assumption of an all-knowing, all-powerful, and benevolent Creator that the question arises how in a world made by him there can be evil. A scientific explanation of the origin of evil is a statement of the conditions of evil, which are on the one hand desiderative beings and on the other a lack of things wanted. The problem of evil thus is at bottom a biological problem. The origin of evil in general as well as that of good will be discovered when the secret of the origin of life is revealed. As opposed to the theoretical problem, is the practical one, how to eliminate evil. This is undertaken

in the practical sciences such as ethics, economics, political theory, hygiene, sanitation, eugenics, etc. This problem, it appears, must be solved by specialization.

EVIL, KING'S. See SCROFULA.

EVIL EYE. See MAGIC; SUPERSTITION; WITCHCRAFT.

EVIL-MERODACH, ʔvil-mê-rô'dâk (the biblical form of the Babylonian *Awel-Marduk*, or *Amel Marduk*, man of Marduk). A king of Babylonia, the son and successor of Nebuchadnezzar II, who, after a reign of less than a year (561-560 B.C.), was put to death by his brother Neriglissar (i.e., Nergal-shar-usur, "O Nergal! protect the King"). He is referred to in 2 Kings xxv. 27 as having liberated Jehoiachin, King of Judah, in the thirty-seventh year of his captivity. Evil-Merodach's name appears on some contract tablets.

EVOLUTE AND INVOLUTE. The *evolute* of any curve is the locus of the centre of its osculating circle; i.e., of the centre of the curvature (see OSCULATING CIRCLE); and relative to its evolute, the curve is called the *involute*. The following example will show the relation between these curves. If on any curve, as

the circle in the figure, a string is closely wrapped, fastened at one end and free at the other, and if the string is unwound from the curve, being kept taut, the curve traced by a pencil fixed to the free end of the string is the involute of that curve from which the string is unwound. The given curve is the evolute of the curve thus traced. This explains the two names. The normal to the involute at any point is a tangent to the evolute, as the construction suggests; and the difference in length between any two radii of curvature to the involute is equal to the length of the arc of the evolute intercepted between them. To Huygens (1673), who was among the first to investigate curves of this kind, is due the name "evolute." He discovered that the evolute of the common cycloid (q.v.) is another cycloid equal to the first. The work in which these discussions occur is Huygens, *Horologium Oscillatorium* (Paris, 1673). See CURVES.

EVOLUTION (Lat. *evolutio*, from *evolvere*,

to unroll, from *e*, out + *volvère*, to roll; connected with Goth. *walwjan*, AS. *wealwian*, Eng. *wallow*). The evolution theory, in its broadest aspect, undertakes to explain the origin of the universe, of all created things material and immaterial; and more especially the origin of our own planet, together with the plants and animals living and extinct, including man, his physical and mental nature. Applied to living beings, we use the expression "organic evolution," "theory of descent," "origin of species," "transformation of species," or "transformism." The theory of descent is supported by a range of facts as wide as the number and variety of forms of life, the species of plants and animals, living or fossil, entering into the millions. To appreciate properly the facts and arguments on which the theory is based one must be familiar with at least the elements of all the natural sciences, especially botany, zoölogy, and geology, and have done some original work on a group of organisms, besides having some degree of sympathy with the aims and methods of natural science. It should be borne in mind that in this single word *evolution* is comprised a study of the mode of action of that vast complex of natural conditions which has resulted in the formation of the stars and planets, and in the stocking of our earth with plants and animals each after their kind.

Evolution in general is based (1) on the unity of action of the processes of nature. We mean by the word "nature" everything which has been generated, produced, or created. This, from a philosophical standpoint, implies an infinite power, or Creator, outside of and yet immanent in the material world, working by natural laws in and through matter, mind, and spirit. The theory of descent, or organic evolution, is based (2) on the principle of the unity of organization in plants and animals; (3) on the fact that the living substance known as protoplasm is the physical basis of life; (4) on the fact that all movements in the plant or animal body are due to the contractility of protoplasm; and (5) to the fact that all plants and animals arise from germs, seeds, or eggs. This does not exclude the view that the first germ of life—the primitive bit of protoplasm—arose by spontaneous generation.

Definition and Classification of Evolution. As will be seen by the historic summary at the end of this article, attempts have been made since the days of Empedocles and of Aristotle to explain the origin of the universe. The word "evolution" originally was applied to such phenomena as that of the unfolding of a flower or the development of an animal, and was used by Haller, Bonnet, and others, in speaking of the metamorphoses of the butterfly or frog. As a name for what we call evolution, Wolff proposed in 1759 the word "epigenesis" and applied it to the mode of growth and development of the vertebrate embryo. See EPIGENESIS.

But for the modern use of the word "evolution" we are indebted to Mr. Herbert Spencer. In his *Principles of Biology* (London, ed. of 1900) "the theory of organic evolution first found philosophic, as distinguished from merely scientific, expression." (Osborn.) It would be, perhaps, preferable to say that he used the word both in a philosophic and scientific sense. He gives us this highly generalized definition: "Evolution is an integration of matter and concomitant dissipation of motion, during which the

matter passes from a relatively indefinite incoherent homogeneity to a relatively definite coherent heterogeneity, and during which the retained motion (energy) undergoes a parallel transformation." The essence of his view is that there is a continual change in the organic world from the homogeneous to the heterogeneous, or from the generalized to the specialized.

Evolution in general may be divided into (1) inorganic; (2) organic; and (3) mental.

Inorganic Evolution. Under this head may be comprised the evolution of the cosmos or material universe, the evolution of our solar system. It is chiefly concerned with the evolution of our own planet, in the manner described by the framers of the nebular hypothesis. It involves the gradual development of planets from primitive nebulous masses through the different gaseous stages of nebulae, which have been happily called, by Clodd, "the raw material of which suns and systems are formed."

Planetary evolution has to take into account the formation of the air or atmosphere, of water, and the origin of the denser minerals comprised in the mass of planets.

Chemical evolution then follows. This is the gradual evolution, underlaid and conditioned by the physical forces of matter, from elementary or still simpler conditions, through compounds of various degrees of complexity to the most complex of all, i.e., protoplasm. In this substance physicochemical evolution reached its farthest limits. Since life began inorganic chemistry has gone no further (Le Conte). It is now being recognized that something akin to evolution must have taken place in the elements, since the elementary atoms postulated by the chemist are themselves supposed to be wonderfully complex aggregates of yet smaller particles.

Organic Evolution. As we shall see, this is the theory of descent, or an attempt to account for the origin of organic species. The theory of descent, however—of the origin of species—was the result of attempts after the time of Linné to define and classify plants and animals. Owing to the perplexing variations of the living plants and animals, the difficulty of drawing the limits between the more variable species, the multiplication of specimens in our museums, showing a filiation between many species, though there were wide gaps between others, it became recognized by Lamarck that species were artificial, i.e., ideas; that the individual only was natural or existed in nature, and that the plant and the animal kingdoms should be represented by a genealogical tree, with its stem forms and later derivatives.

As the knowledge of species increased, through the sciences of embryology, morphology, paleontology, and the new light thrown on the earth's history by great advances in geology, a sufficient fullness of knowledge resulted, and almost in a single year (1859) the combined researches of the studies of plant and animal life in different quarters of the globe culminated in the epoch-making theory of descent proposed by Darwin and by Wallace independently of each other, and seconded by Hooker, Fritz Müller, Asa Gray, Huxley, and others.

Under the head of Organic Evolution we have the factors or agencies by which variation has been brought about, giving us the materials on which natural selection acts. The great facts in nature are adaptation and variation, and the causes of morphogenesis, of the origin of types

and species, and all the actions of the physical agents, such as light, heat, cold; the chemical changes of the medium in which plants and animals live; changes in the environment, i.e., climate, temperature, altitude, and physiological changes, such as the use and disuse of organs, parasitism, and, finally, heredity. These are called the "primary" factors of evolution, while "natural selection" expresses the results of the action of these primary factors of organic evolution.

Mental Evolution. The actions of animals are physiological or reflex, instinctive, and rational. Man, with his exalted nervous vigor and brain power, alone thinks, reflects, or is self-conscious. It is probable that the more intelligent insects and most of the vertebrates are conscious agents. It is well-nigh impossible in the last analysis to draw the line between the mental acts of animals and man. The germs of reason exist in animals, and the intellectual qualities of man have with little doubt originated from those of the animals, wide as is the gap between the mental, moral, and spiritual nature of man, and the simple, elementary mental faculties of animals.

The result of this mental evolution—the physical evidence of which is seen in the great number of vestigial structures handed down from the higher mammals, in the cranial character of the highest existing races as compared with the fossil races, in his erect position, his culture history, with its progressive steps, from primitive savagery up through barbarism to civilization—shows that at first brain use and development, the exercise of wit, cunning, craft, invention, skill, mastery over the elements, over the beasts, over himself; that high endeavor, the gradual elimination of savage impulses, success in the arts and sciences, due to his social mode of life, and finally a tireless devotion in the highest types of the race to the true, the beautiful, and the good, and appreciation of the divine in human nature, and, finally, the practice and exercise of love to God and to man—that all these have been the agents of his mental evolution, of his moral regeneration, and his devotion to his highest ideals, giving him the promise and potency of existence in another world than that witnessing his physical evolution, where his intellectual and spiritual forces shall have the freest play, unhampered by a struggle for mere animal existence, by competition with baser forces. See BERGSON, HENRI.

Species, Varieties, and Races. The individual is a concrete fact. A species is an induction, a generalization. (See CLASSIFICATION.) Our idea of most species is based on a pair or only a few individuals, whereas the actual number of individuals of most species may be counted by the thousands or even millions. Our conception of a species varies with the number of specimens in our collections; and systematists naturally differ greatly as to the limits of many species. The best definition of species is that of Lamarck: "A species is a collection of similar individuals which are perpetuated by generation in the same condition as long as their environment has not changed sufficiently to bring about variation in their habits, their character, and their forms."

A variety, or subspecies, is a group of individuals breeding true to each other, which resemble each other in color, size, etc., i.e., in characters less pronounced than those of species.

Darwin calls a variety an incipient species, or a species in process of formation. Local varieties are fixed variations of species with a wide range; they are restricted to small areas shut in by mountain ranges, etc. They are thus due to different local environments, to differences in temperature, altitude, dryness or moisture, soil, etc. Local varieties, says Wallace, are the first steps in the transition from varieties to species. Varieties are subdivided into "races," though the two terms are often used interchangeably. Huxley calls a race "a propagated variety." Races are subdivided into "breeds," and these into "strains"—the numerous breeds of pigeons, as the fantail, pouter, barb, tumbler, English carrier, etc., are examples of breeds, while a strain is the least recognizable variation from some racial form. Among domestic horses, we speak of the Arabian, Clyde, or Percheron breed; of the Morgan or Hambletonian strains. The American trotting horse is a breed which has been formed by artificial selection since the year 1822.

Sports. Much interest is now felt in the matter of "sports" or aberrations. A sport may be defined as an individual which is born of ordinary parentage, but differs in some marked physical or mental characteristic. Sports in cultivated plants or domestic animals appear without any known cause, whereas aberrations in moths and butterflies are readily produced by artificial changes in temperature, humidity, or dryness. Among animals, the famous Ancon or otter sheep is as remarkable as any. By careful breeding with normal sheep, this long-bodied, crooked-legged sheep became the progenitor of a flock resembling the first aberration. Nature abhors aberrations and by natural selection wipes them out. Yet Galton thinks that the transmutation of species is due to sports, and De Vries upholds the theory of mutation, by which variations from the normal, if useful, are seized upon, and perpetuated by natural selection. With this view we sympathize, for the occurrence, claimed by Darwin, of vast numbers of intermediate forms between what are now "valid" species, is a doctrine difficult to apply to all cases.

Sports may be divided (1) into "teratoid" sports, the result of discontinuous variation, in fact monstrosities, and (2) "biotic" sports, which are due to more or less sudden changes of the conditions of life.

The remarkable experiments of Standfuss show that in lepidoptera the crossing of an aberration with the parent form may often result, not in the production of intermediate types, but in the sharp cleavage of offspring into two groups, each resembling one parent and not the other.

Factors of Organic Evolution. We will now pass on to the mechanism of evolution, the means by which species and genera, and even orders, classes, and phyla, have been evolved. These factors are (1) changes in the environment, and (2) dynamic or physiological, i.e., the result of movement, strains and stresses, due to the exercise of organs.

Effects of Changes in the Cosmical Environment of the Genesis of Life Forms. When the earth was cooling down from a gaseous to a solid condition, it is most probable that the changes in the cosmical environment had an immediate and creative or modifying effect on the beginnings of life. It is certain that the

action of the same cosmical agents, such as motion, gravity, electricity, etc., which have determined the spherical shape of the planets, as well as of a drop of water, has been concerned in determining the shapes of cells, of eggs, of the simplest organisms, and is the basis of all physiological phenomena as well as of motion in animals.

Plant and animal life are influenced in a way we do not understand by electricity: they are also influenced by variations in the pressure of the air. Jaeger claims that the force of gravitation is the primitive morphogenetic factor in the development of animals. In the growth of plants the influence of gravity and light is marked. The influence of gravity on the form of shells is noticeable. To this has been, by Hyatt, attributed the asymmetry of univalve shells.

The mechanical state of the medium is important in modifying the shape of animals. The spindle-shaped body of fishes enables them to cleave the water; so it is with the shapes of winged animals, whether insects, birds, or pterodactyls. When some terrestrial mammal was driven by necessity or competition with its fellows to seek a livelihood in the sea, and thus gave origin to the order of whales, its body underwent a transformation; it became fishlike in shape, and while from disuse it lost its hind limbs, the forelegs were converted into fins.

When animals of very different types, such as the earthworm, many sea worms, multitudes of parasitic worms, the boring larvæ of insects, live in a denser medium than water and have been obliged to burrow in the soil, or in the dense tissues of their hosts, the body tends to become elongated, cylindrical, and pointed at each end.

Effects of Changes in the Chemical Nature of the Medium. Every one is aware how rapidly most sea animals, all except the migratory fishes, such as salmon, die when placed in fresh water. The effect of living by the sea on land plants is to thicken their leaves. The palisade cells are more numerous and larger than in leaves of the same plants when grown inland. Apparently the sea salt is the cause of this alteration, as plants cultivated in an artificially salted soil yield thicker leaves. Such a change as this is the result of the direct action of a changed environment.

The effect of a change from fresh to salt water on delicate forms, like the phyllopod crustaceans (*Branchipus*, etc.), is to dwarf them. Thus, the little brine shrimp (q.v.) is apparently a dwarfed and otherwise modified form of some fresh-water ancestor.

Experiments have shown that the brine shrimp varies greatly with differences in the density of the water in which it lives, with the result that here we have a transformation of one species into another. One form living in strong brine has a longer abdomen than others living in a weaker solution. This has been observed in nature and also in forms living in the laboratory.

The lakes near the Sea of Aral are known to vary in degree of saltiness at different seasons of the year; the result of this change from saline to comparatively fresh water causes marked variation in the pond snails, so much so that the extreme varieties might be regarded as distinct species. So with the cockleshells; the semi-fossil ones on the borders of lakes which once formed a part of the Aral Sea vary greatly.

Effects of Changes of Light. Our light comes from the sun. Without sunlight there would be no life. Were it not for the stimulus of the sun's rays, animals would be eyeless; and it is the absence of light which bleaches animals living in darkness, preventing the formation and development of the pigment in the skin. On the other hand, the colors of animals, the beautiful and varied tints of butterflies and birds, of tropical shells as well as the gorgeous hues of flowers, are all due to the stimulating effects of light.

Light is necessary for the development of chlorophyll, and therefore is an indispensable agent in the life of all green plants, and especially for tree life and wood formation. Sachs observes that "the forms and modes of life presented by plants . . . must have been to a large extent induced by the continued action of gravitation and light." And this applies as a general statement to the simple animals and in a sense to all animal life.

The influence of changes in the environment, and especially of light, on organisms may be immediate and direct, or it may be indirect. The French botanist Bonnier has shown by experiments that a life in feeble light produces a change in the structure of plants, and that if placed in markedly different surroundings they either perish or become rapidly modified to meet the changed conditions. He has found that Arctic plants differ noticeably from the same species growing in Alpine regions in the greater thickness and simpler structure of the leaves and has attributed this to the feeble light of the Arctic region and to the greater degree of moisture. By means of feeble electric lighting and a moist, cool temperature he had in his laboratory in Paris produced these differences, i.e., converted Alpine into Arctic plants.

Phototaxis. This means the influence of light in directing the movements of freely moving cells or unicellular plants, as certain bacteria. "Heliotropism" means a turning to the light, as seen in the case of infusoria, and many higher animals which will in an aquarium press to the light and collect on the side of the vessel next to the light. The influence of light on night-flying moths and other insects is well known. See **TROPISM**.

Color Preference. Different animals have a marked preference for certain colors of the spectrum, in which they seem to feel better. The little crustacean *Daphnia* prefers to swim in orange, yellow, and especially in green light. The starfish shuns the red rays. Animals which love light, such as bees, prefer blue or green, while the light-shunning forms, such as ants, have less antipathy for red than for other colors. In these cases light doubtless acts as an excitant on respiration. It has been observed that slugs almost always move with reference to certain external agents, as gravity and strong light; they move in straight lines vertically either from or towards the light. It is so also with the *Hydra*, and starfish, as well as with the larvæ of certain starfish.

Colors of Animals Influenced by Light. It is well known that the chameleon and the Floridan *Anolis* lizard, as well as tree toads, rapidly change their color from green to gray or brown, according as they rest among green leaves or on the trunk or branches of trees. The "chromatic function" is that adaptation of the color of the skin of these animals, as well as of squids, crus-

taceans, etc., to that of their surroundings. This is due to the contraction or expansion of the pigment cells (chromatophores) in the skin. The pigment differs in color in different individuals and species, and in different parts of the body, being yellow, brown, black, sometimes even red or green. On their distribution and their alternate expansion and contraction under the influence of the nervous system depends the pattern which the frog's skin displays at any given moment.

It is claimed by Biedemann that the color cells change their shape as the result of the direct action of light and temperature. It appears that the slightest change of temperature affects the mutual disposition of the pigment cells, and consequently the color, of the frog. Keeping the animal in the hand is enough to provoke a contraction of the black cells.

That the light acts as a direct stimulus has been proved by Steinach, who glued strips of black paper to the skin of frogs which were kept in the dark, when they were exposed to the light only the uncovered parts of their skin became paler, while the covered parts remained dark. To avoid all doubt, the experiments were repeated on skin separated from the body, and photograms of letters and flowers, cut out of black paper and glued to the skin, were reproduced upon it. Besides, blind tree frogs do not become darker, as fishes do; and Biedemann has proved that the chief agency of their changes of color is not in the sensations derived from the eye, but in those derived from the skin.

The action of light also causes the varied hues and markings of the chrysalids of butterflies. During the semipupal state, before the chrysalis is fully formed, the surface is, so to speak, photographically sensitive to the color of the surroundings, and the gay hues of such pupæ are due to exposure to the surroundings. Thus, Poulton found that where the pupæ transformed in boxes, lined with black paper, they became dark, while white light produced pale ones, many of the last being brilliantly golden; this suggested gilt surroundings, which were far more efficient than white in producing chrysalids of a distinctly golden color, and even of a deeper hue than often occurs in nature.

The under side of flounders and other flatfish, as is well known, is white, owing to the absence of pigment, while the upper side of the body is dark, or variously spotted, or eyed. When the under side is dark, the fish will be found, according to Pouchet, to be blind.

By experiments in severing the connection of some of the spinal nerves with the sympathetic nerves of the same side, Pouchet succeeded in limiting the chromatic function to those spots where the nerves remained in connection with the sympathetic; and he was thus able to produce at pleasure a zebra-like marking on one side of a fish, while the other side retained its natural hues and their normal variation, according to the colors reflected from surrounding objects.

It is well known that small flounders and various kinds of shrimps will turn pale if placed in a white dish of salt water, and the red, green, and brown colors of shrimps and other crustaceans will change in a few hours in color to correspond with the green, red, or brown seaweeds in which they rest. This was carefully observed in the case of the prawn by Herdman, who also kept a number of specimens of different

colors under observation in jars with various colors of seaweeds and of background and in very different degrees of light. The results showed that the adult animal can change its coloring very thoroughly, though not in a very short space of time. The change is due to alterations in the size and arrangement of the pigment granules of the chromatophores.

It will be seen from these facts that the wonderful hues of tropical fish, with their colored bands, the stripes of snakes, or of the tiger, the spots of the leopard, the gay markings of caterpillars and of butterflies, as well as of spiders, are originally due to changes in light and shade. This will also apply to many of the protective markings of insects and other animals; the initial cause or factor is the varying action of the sun's light, though natural selection may act as a secondary factor, those forms or varieties most protected by their special style of coloration surviving.

Effects of Darkness. On the other hand, the absence of light, or a life in perpetual darkness, has gravely modified the visual organs of cave animals and those living in the abysses of the sea. (See CAVE ANIMALS.) In the case of the blind beetles, crawfish, spiders, myriapods, etc., of caverns, we have the most obvious facts showing the direct action of the environment. The members of the fauna of our caves have their eyes variously affected; some are blind, others have vestiges of eyes, and others are completely eyeless. The cause is simply the result of disuse, for natural selection does not operate in such cases. The loss of eyesight and the scanty food render the body slender, pale, colorless, while, in compensation for the loss of sight, the tactile sense is greatly exalted; the antennæ, legs, and other appendages are remarkably long and slender compared with those of their out-of-doors relatives. The whole subject of cave life affords a most instructive example of the effects of the absence of light, the disuse of organs and their different degrees of atrophy, and other remarkable modifications of the body, and of use-inheritance, all brought about by the action of the primary factors of evolution, without the intervention of natural selection. It is proper to say, however, that Weissmann and other ardent Darwinians account for the facts by natural selection.

Other animals live in holes in the sea bottom, as some blind crustaceans and fishes, whose eyes in the very young are normal, also towards or at maturity become blind, and perhaps eyeless. The blind fishes and crustaceans of the deep sea afford similar instances. It is a significant fact that those animals, notably the fishes, are provided with phosphorescent organs.

Effects of Changes of Temperature. If a life in total darkness causes great variation and the origin of new forms adapted to strange conditions, so also great changes in temperature, as shown in nature and by laboratory experiments, afford the strongest circumstantial evidence of the origin of new species by changes in the condition of life. It should be observed that variations due to changes of temperature are not fortuitous, but in direct relation to such changes of environment.

There is for each individual, and hence for each species, an optimum temperature which is most favorable to its welfare and most favors nutrition and hence growth and multiplication. On the other hand, extremes of cold (minimum)

and of heat (maximum) are unfavorable and tend to cause death. Cold and its equivalent, altitude, tends to dwarf plants, shells, etc. When pond snails are transported into a cold region, where the temperature is below the optimum, sexual maturity is reached before the animal has attained its full growth, and there is thus formed a dwarf race by simple change of climate. Hence this is the reason why Alpine and Arctic species are of very small size compared with those of lowlands in the temperate zone.

Certain plants, mollusks, crustaceans, etc., may become adapted to hot springs, constituting a thermal-spring fauna. Several kinds of mollusks live and prosper in the thermal waters of the Pyrenees, and of Dax, whose temperature varies from 25° to 35° C. (76° to 94° F.). A gastropod (*Melania tuberculata*) lives in the hot springs of Algeria in a temperature of 87° F., and a beetle (*Hydrobius orbicularis*) in the hot springs of Hammam-Meskoutine, with a temperature of 55° C. (130° F.); in cooler portions of the heated stream live a little fish, and the fresh-water crab (*Telphusa fluciatis*). A small mollusk supports a heat of 122° F. in Italy, and another (*Neritina thermophila*) occurs in a hot spring in New Ireland, with a temperature of 122° and 140° F.

Finally, the supportable maximum appears to be confined between 105° and 113° F. It is known that at 122° F. protoplasm, at least in vertebrate animals, partially coagulates, and this causes death as by sunstroke, though Rotifera may withstand even 80° C., while Protista live in hot springs far above 80° C., and green algae can survive 70° C. Yet, as we shall see further on, monads can be so modified by a gradual elevation of the temperature as to withstand the extreme of 158° F.

Very striking experiments have recently shown that varieties and species may be artificially produced by variations of temperature, which in some cases are like those in nature. This is as near an actual demonstration of the evolution of species as we can expect to reach. Mr. Wallace remarks that we have never seen a new species formed by natural selection; but in these temperature varieties we see how species have arisen by the direct action of a change in the environment.

Sudden changes cause death, but if the change is slow and gradual the animal may become adapted to or acclimatized in a temperature relatively high. By thus raising the temperature Dallinger practically produced a new temperature race or variety of infusorian (*Heteromita*). For a period of over 10 years he made observations on this infusorian. Observing that a new generation comes into existence every four minutes or so, it took years of experimentation to raise the temperature to 158° F. Beginning with the normal temperature of the water at 60° F., in four months he had raised it to 70°, without, however, affecting the monads, which continued to multiply by fission as vigorously as before. When 73° was reached, however, an adverse influence seemed to be exerted on the organisms as regards their vitality and productiveness; but by keeping the temperature constant for two months the new generations became, so to speak, acclimatized, and in five months more the temperature was gradually raised to 78°. These experiments were continued until the temperature of 158° F. was reached, when an accident put an end to the

experiments, and the new race thus adapted became extinct.

Another instance of the effects of changes in temperature is the case of a pond snail (*Physa acuta*) which lived in the water of an artesian well with a temperature of 32° to 33° C. (c.90° F.): they were dwarfed and frequently deformed, but they reverted to their normal size when, owing to the diminution of the supply, the water became cooled at the end of two years. Owing to the great summer heat (104° F.) in the Transcaspian oasis, birds molt in summer. Dolbear states that the rate of the chirp of the cricket is entirely determined by the temperature; at 60° F. the frequency is 80 times a minute, and at 70° it chirps 120 times a minute.

Wasmann was able during three successive winters to induce parthenogenesis in the workers of an ant (*Formica sanguinea*), and in their helpers or slaves, by artificially warming the nests. On one day as many as 12 workers of this ant were seen laying eggs. Most of them were large workers, but small ones were also affected, and the smaller the ant the more tedious was the process of egg laying. Of many hundreds of eggs thus laid none attained full development, as the eggs or larvae were all devoured by the ants. Many mollusks common in France become in Africa (Algeria) doubled in size, while *Bulimus decollatus* becomes even nine times larger than in Europe.

On the other hand, cold is an efficient agent in modifying plants and animals. It is well known that fishes, caterpillars, etc., can be frozen, and, if gradually thawed out, become again active. One of the cabbage butterflies (*Pieris brassicae*) may live through -20° C., and the European garden snail (*Helix pomatia*) survives refrigeration to -130° C., the lowest temperature which could be obtained (Yung). As is well known, the cold of highlands and of mountains, as well as an extreme northern climate, dwarfs man and animals as well as plants, while the proportions of the body are also changed. Salamanders, like the axolotl of Mexico, and the siren of Lake Como, Wyo., under the influence of the elevation and low temperature, become retarded in their development; while the reproductive organs become accelerated in development and they breed while in the larval state. Parthenogenesis in aphids ceases at the approach of the autumnal cold.

Effects of Change of Climate. This has a much greater effect on the origination of varieties and species than is generally supposed. It was formerly the fashion to claim that climate had little or nothing to do with the origination of species. It is not improbable, however, that nearly a third or a half of the species in museums, or of those described in biological literature, are climatic or local varieties or species. The study of variation as now carried on, by measurements of great numbers of specimens, shows that each region, however limited, has its local race or breed, each of which differs from the others in slight yet constant features. And on general principles it is a change in the conditions of life, however slight, which reacts on the organism and results in adaptation to the environment.

Local varieties are usually restricted to small circumscribed areas, separated by mountains, or by altitude, or by moist or dry regions; or, if marine, by different kinds of bottom, whether

sandy, muddy, or rocky, or by different degrees of saltiness of the water.

In the fresh-water fishes of the Pacific slope each locality has its peculiar variety, which in the aggregate is different from the variety of every other locality (Gilbert and Evermann). These variations are due to the different environment, for the differences in temperature, altitude, and topography in the course of the different streams which take their rise in the Sierra Nevada are very marked. Indeed, whether we consider the insects, fishes, birds, or mammals in such a region as the Pacific coast, which is undergoing rapid erosion or base-leveling, the number of local species and sub-species, is remarkable. Packard has observed that species of moths which do not vary much on the Atlantic coast, where the topographical conditions are more stable, are in California exposed to very considerable variation.

Even in two neighboring lakes in Indiana (Lakes Turkey and Tippecanoe) the individuals of a darter (*Etheostoma caposodes*) from one lake differ constantly from those of the other lake in color, in the scales of the nape, and of the lateral line, in the number of spines in the anal fin, in the number of dorsal spines and rays. (Moenkhaus.) Similar instances are the absence of ventral fins in some of the fishes inhabiting even widely separated mountain lakes, and the presence of enlarged scales along the base of the anal fin in the cyprinoid fishes inhabiting the mountain streams of India, also the peculiar color patterns of the fishes in certain portions of northern Georgia. See ISOLATION.

Introduced species tend to vary much more than in their native lands. Children born of British, German, or French parentage become in the United States slightly taller than their parents; the soldiers of the United States army during the Civil War of 1861-65 were found, by measurements made on 1,110,000 individuals, to average taller than those of the British army.

Dr. Bumpus has critically examined and measured over 1700 eggs of the English sparrow, one-half from England and the other half collected at Providence, R. I. He found that the eggs of the new or American race or breed vary much more than the European, differing in being smaller and of a strikingly different shape, being more rounded and with a greater amount of color variation. His measurements of the European periwinkle (*Littorina littorea*), 3000 from England and 3000 from New England, afforded similar results. Since its introduction, about 1855, into the Bay of Chaleurs and its rapid spread along the coast to New York, this little mollusk has undergone a transformation adapting it to the different conditions of our northeastern coast. It has become more elongated, lighter in weight, more bulky, and the color markings are less pronounced. Also large collections, in some cases 1000, from Casco Bay, Woods Hole, Seaconnet, Newport, and Bristol, were found to present constant variations at each locality, the curves of variation exhibited on the charts prepared by Dr. Bumpus being different for each locality. So it is with a European land snail (*Helix memoralis*) introduced within a few years into Lexington, Va. In Europe this is an exceedingly variable species, but already of the 125 Virginian varieties found by Mr. Cockerell, 67 are new and unknown in Europe.

But by far the strongest and clearest evidence of the means by which species are originated are afforded by Dr. J. A. Allen in the case of our American birds and mammals, his results having been based on prolonged studies made upon a vast number of specimens from different localities. Our birds are found in passing from the Atlantic to the Pacific coast to vary in general size, in the size of the peripheral parts (wings, etc.), and in color, thus varying with latitude or longitude. There is an increase in size from the south northward, not only in individuals, but generally, though there are some exceptions. The largest species of each genus and family are northern, as in the cases of the fox and wolf, the latter being one-fifth larger in Alaska than are southern species of their kind. In the case of those birds which breed from New England to Florida, the southern ones are smaller and differ in color. Mammals and birds, in their southerly examples, have larger ears and feet, and the cattle have larger horns. The hares have less furry ears and naked soles; the sagebrush hare has longer ears southward; so with the large long-eared "jack rabbit." In birds bill, claws, and tail are larger in southern species, and all the largest-billed birds live in the tropics. This, however, is to be observed in sparrows, blackbirds, crows, thrushes, wrens, and warblers, in the quail, meadowlark, and flicker. In Florida forms with slender bills common to that State and to the North have beaks still more slender, longer, and decurved. Those with a short conical bill have thicker and longer bills than their northern relatives, though the birds themselves are smaller. It is so with the tail—the size of the body is the same as in the North, while the tail is proportionately larger and longer.

The color in mammals, as the red squirrel, changes in going southward from pale yellow or fulvous to rufous. Except three species, all squirrels living north of Mexico have the lower parts of the body white, while those inhabiting tropical Mexico have the lower parts fulvous, deep golden, orange, or even dark brownish red. In birds the colors are so much stronger and darker in southern forms that they might with their smaller size and larger bills be regarded as distinct species. The blue jay, cardinal, and other birds have, in the South, a more brilliant and intense hue; some species are mere black and red. In crossing from the Atlantic to the Pacific coast Allen observes that there are three phases of color. On the Atlantic coast the birds are bright and strongly colored; on the great plains they are pallid, owing to the dryness; and on the humid, heavily wooded Pacific coast the hues are deep-colored or piceous, both in birds and mammals.

The same obtains in the Old World. The marsh tit of Europe in warm, rainy regions has its browns intensified; in dry, sandy districts the plumage is paler; in the Arctic regions it varies in paleness, and in Kamchatka it is almost white (Dixon). The birds of the Galápagos Islands differ from their nearest allies of the South American mainland in their larger bills, shorter wings, longer tails, and darker colors. Besides this each of these islands has its local species or varieties, which do not pass from one island to the others.

The most important direct experimental evidence of the effect of humidity on color is Beebe's work on doves (*Zoologia*, I, No. 1, New York

Zoölogical Society), where in successive molts differences were obtained which would be of full specific value in nature.

Many other examples could be given, but enough has been stated to prove that in the past, as well as at present, changes in climate have had an all-powerful influence in the origination of species. To this factor, together with migration and geographical isolation, we may attribute a very large proportion of the known species of plant and animal life and also the races of mankind.

Seasonal Dimorphism. Ordinary sexual dimorphism is where there are two forms of one sex, the cause of such a modification being unknown. In seasonal dimorphism, however, the cause is due to changes of temperature. Thus, by subjecting the chrysalids of lowland butterflies to prolonged cold in ice chests Weismann proved that northern or Alpine species are climatic or seasonal varieties. W. H. Edwards has shown that two of the four polymorphic forms of *Papilio ajax* (i.e., *walshii* and *telamonides*) emerge from winter chrysalids, and *Papilio marcellus* emerges from a second brood of summer chrysalids.

Cases of seasonal dimorphism frequently occur among tropical butterflies. While in the north or temperate zone we have winter and summer forms, in the tropics of India and of Africa there are wet-season and dry-season forms. It is curious that the difference between the two forms principally consists in the fact that one looks on the underside like a dry leaf, while the other is marked with eyelike spots, or ocelli. Their identity has been proved by raising both forms from the same batch of eggs. This case appears to be due to the direct action of the season—in the dry form to dryness and heat, in the wet form to the moisture and coolness of the wet season. Weismann, however, maintains that these changes of climate or season are “only the stimulus, not the actual causes,” the latter being the processes of selection—a quite hypothetical cause, although 20 years ago he attributed the change to the effect of change of temperature. Limitations of space forbid one enlarging on this fascinating theme, but we may briefly refer to the remarkable experiments of Standfuss, who, by subjecting pupæ of Swiss butterflies to heat or cold, has produced artificially true temperature varieties, as follows: (1) seasonal forms, similar to those known in nature (*Vanessa cardui albus*, and *Papilio machaon* to some extent); (2) local forms and races similar to those which occur constantly in certain localities (*Vanessa urticae*, *cardui*, and to some extent *Papilio machaon* and *Vanessa antiopa*); (3) entirely exceptional forms or aberrations, also occurring from time to time in nature (*Vanessa io*, *cardui*; *Argynnis aglata*); (4) phylogenetic forms, not now existing, “but which may either have existed in past epochs or may perhaps be destined to arise in the future” (*Vanessa io*, *antiopa*, *atalanta*). The conclusion from this and experiments by others shows, as Standfuss claims, that such forms are the result of the direct action of a change in the temperature.

Effects of Change of Food. While changes of light, heat or cold, moisture and dryness, are fundamental factors in causing variation, the abundance or scarcity and the nature of the food are an equally potent agency, not only affecting growth and reproduction, but in producing variation and, by causing a change in

habits, in bringing about profound modifications of the body. We will begin with the simplest organisms. Maupas believes that the reproductive power of ciliate infusoria depends (1) on the quality and quantity of food, (2) on the temperature, and (3) on the alimentary adaptation of the buccal organ. With favorable nutrition an infusorian (*Stylonichia pustulata*) undergoes self division once in 24 hours at a temperature of 7° to 10° C. (42° to 50° F.), twice at 10° to 15° C. (50° to 60° F.), thrice at 15° to 20° C. (60° to 69° F.), four times at 20° to 24° C. (69° to 76° F.), and five times at 24° to 27° C. (76° to 80° F.). Thus, at a temperature of from 25° to 26° C. (76° to 80° F.), a single *Stylonichia* would in 7½ days have a progeny of 100,000,000,000, estimated to weigh 100 kilograms (about 230 pounds). With a vegetable diet the rate is much less and the size smaller. Maupas also shows that infusoria continue to multiply by fission until the supply of food fails, when hunger leads them to conjugate.

Polymorphism. It now appears that the polymorphism of the social insects is due to the nature and amount of food. The existence of worker ants and bees, whose characteristics are not inherited from their parents, has been a stumbling-block to the theory of descent. As Darwin states it: “The difficulty lies in understanding how such correlated modifications of structure could have been slowly accumulated by natural selection”; the “acme of the difficulty” being “the fact that the neuters of several ants differ, not only from the fertile females and males, but from each other, sometimes to an almost incredible degree, and are thus divided into two or even three castes.” The castes, moreover, do not commonly graduate into each other, but are perfectly well defined; being as distinct from each other as are any two species of the same genus, or rather as any two genera of the same family. It has also been found by Wheeler that in a Texan ant the several castes are at first all alike, the remarkable differences between the large and small-headed workers being due to differences in the amount and nature of the food.

It is well known that the larvæ of the worker honeybees are fed with much less nutritious food than those of the queens, which are fed on “pap,” or “bee milk,” a highly nitrogenous food which has apparently a singular power of developing the reproductive glands. The white ants (*Termitidæ*) are remarkable for the polymorphism of the species, there being in one kind eight castes, among them workers with small heads and others with large heads, and soldiers of two castes, i.e., small-headed and large-headed. It has been found by Grassi that all these castes are born alike, and that the differences between the castes are chiefly due to the varying nature of the food and have nothing to do with heredity. The small-headed forms have a scanty diet, live on refuse matter, and even eat their own excrement, this being used in the construction of their galleries. The soldiers live on sick or disabled companions. The young are fed only with saliva. From these facts it appears that the amount and nature of the food are the chief cause of the wonderful differentiation of the castes of the social insects; besides this there are the results of the division of labor in the community, use and disuse, together with specialization of labor, arising from the varied life of the populous colony.

Difference in the amount and nature of the food, involving low or under and high feeding,

results in a discrepancy in the number of individuals of either sex.

It is now clear that a preponderance in the number of females is the result of high or better feeding. Yung experimented on tadpoles and increased the proportion of females as the diet was improved. In the first brood, by feeding one set with beef, the percentage of females rose from 54 to 78; in the second set, fed with fish, it rose from 61 to 81; while in the third lot, when the especially nutritious flesh of frogs was supplied, the percentage rose from 56 to 92; i.e., in the last case the result of high feeding was that there were 92 females to 8 males.

The result of Düsing's experiments with sheep leaves little doubt that abundant moisture and food tend to the production of females, while high temperature produces males. The heavier well-fed ewes brought forth ewes, while the lighter, underfed ewes gave birth to males. Giron divided a flock of 300 ewes into two equal parts, of which one-half were extremely well fed and served by two young rams, while the others were served by two mature rams and kept poorly fed. The proportion of ewe lambs was 60 per cent and 40 per cent respectively.

Use and Disuse as Factors. Thus far we have considered the action of those factors which are concerned rather with the origination of varieties and species than of higher types; with the causes of specific variation rather than of the formation of genera, families, orders, classes, and branches, or phyla. While gravity, light, and the allied factors evidently come into play in morphogenesis, the inquiry arises how the higher categories of organic forms originated. This must mainly have been accomplished through change of environment, inducing new needs, the formation of new habits, or change of function, all operating together and resulting in adaptations to the new mode of life. In all this the principle of use and disuse plays a most important part. See DISUSE.

New Structures. An interesting example of the origin of a new structure due to change in habits and to resulting strains and movements is the formation of bivalve shells in animals of classes so unlike as the bivalve mollusks (Pelecypoda) and the ostracod, phyllopod, and phyllocaridan crustaceans. The shell, or carapace, has become folded into two valves to protect the body. The valves are opened and closed by the relaxation or contraction of one or two peculiar muscles, the adductors. These muscles are not homologous with any muscles in other classes, and at least in bivalve mollusks they are probably developed from the mantle muscle as a consequence of the conditions of the case. The several types thus occurring in different branches, or phyla, "is a strong proof that common forces acting on all alike have induced the resulting form." (Jackson.) There are also good examples of mimicry or "convergence," and many so-called cases of mimicry are undoubtedly merely examples of such convergence or similarity of form due to the subjection of animals of quite different groups to identical habits or conditions.

Now, as the order of Crustacea is founded in part on the nature of the carapace or of the limbs, whether adapted for walking, swimming, or biting, etc., the ordinal characters are evidently due to the different uses to which these parts are adapted. It is so with the classes of mollusks; the bivalves are secondary forms

which by change of habits gradually evolved from some wormlike ancestor. The gastropods, with their unsymmetrical shells, and the creeping or swimming cephalopods, with their closely coiled shells (when a shell is present), are clearly the result of the use of certain parts, the disuse of others. So it is with the orders of mammals and birds, and the form of man is mainly due to the disuse of his feet in climbing, to his erect position, and to the use and exercise of his brain.

Coöperative Evidences of Evolution. That the general theory of evolution represents the truth of history and existing facts is supported by evidence from all departments of biology. The basis of morphology is anatomy and embryology. As soon as anatomists studied the mode of development of organs and traced their history from the germ, it was found that organs of the most diverse shape and use had had a common origin. Thus, the arm of man, the foreleg of the lion, the flipper of the seal, the paddle of the whale, and a fish's fin were found to be morphologically identical—the same in origin and fundamental structure—while the wings of a bird and an insect were perceived to be simply analogous. Thus, what seemed the most diverse organs were found to have a common origin. Also cell studies proved that the cell is the unit of organic life.

Classification also yields evidence. It is now recognized that the plant and animal kingdoms may each be represented by a genealogical tree; that the members of different classes, orders, families, genera, species, and varieties are blood relations which have had a common descent from some primitive form, and that ultimately the vegetable and animal kingdoms have descended from a common ancestor. Taxonomy is an attempt to unravel these lines of descent. In classifying animals of any group (see CLASSIFICATION) we are constructing a phylogeny, or genealogical tree.

Embryology furnishes an argument. The mode of development of an animal throws light on its affinities. Thus, the barnacle (q.v.) was supposed to be a mollusk until its development from a nauplius young, very similar to that of certain crustacea, proved that it is a member of that class. Mere resemblance between the young of members of different classes points unerringly to their common origin. Embryology (q.v.) teaches that all plants and animals have originated from a one-celled form. At one stage the fish, amphibian, reptile, bird, mammal, and even man are indistinguishable from each other, and the resemblance of the early embryo points to the origin of all vertebrates from some wormlike form. From his studies on the embryology of vertebrates, Von Baer first indicated the "recapitulation theory"—i.e., that the different stages of development of a highly specialized animal constitute an epitome or recapitulation of that of the class or type to which it belongs.

As stated by Von Baer, and afterward more fully by Agassiz, the law expresses a general fact. It was Fritz Müller who, in 1864, explicitly pointed out its evolutionary or phylogenetic bearings, and in 1866 Haeckel restated the doctrine in the following words: "The developmental history (ontogeny) of an individual animal briefly recapitulates the history of the race (phylogeny)—i.e., the most important stages of organization which its ancestors have

passed through appear again, even if somewhat modified in the development of individual animals."

Thanks to recent advances in morphology and embryology, and particularly to the study of vestigial structures, we are in a position to work out the phylogeny of the animal kingdom, or any group of it, with some approximation to exactitude. Even within the limits of a genus it is in some cases possible to detect vestiges of what were primitive characters and thus to arrange in genealogical order the different species. It is this sort of work which gives new life, dignity, and importance to classification.

Vestigial Structures. The study of vestigial characters in highly specialized animals gives the clew to their ancestry. Thus, man has in his body about 70 vestigial structures which appear to be of no use to him; some, as the caecal appendage (see VERMIFORM APPENDIX), a positive menace; and all these afford the strongest possible circumstantial evidence of his descent from an arboreal ancestor.

The study of the changes undergone by animals like the frog or butterfly after birth, or what we call "metamorphosis," is rich also in facts and suggestions which tend to prove that such wonderful changes are due to the action of the primary factors of organic evolution. It is so also with the hypermetamorphosis of certain insects. On the other hand, in groups of animals which normally undergo a metamorphosis, development may, with a changed environment, be direct or abridged. It is so with the lobster, certain crabs, some insects, and especially some of the tree toads of the West Indies and of South America. As examples, a Guadeloupe species of *Hylodes* (q.v.) is hatched in the form of the adult; since there are no marshes on the island, the tadpole state is suppressed, or passed through in an abbreviated way in the embryo. On the island of Martinique the young are tadpoles, but they are carried on the parent's back. The Surinam toad (*Pipa*) has similar breeding habits, yet the young have small gills, which, however, are of no use to them, as the tadpoles do not enter the water, but are carried about in cavities on the back, where the young pass through an abridged metamorphosis.

We have also seen that parthenogenesis (q.v.) is due to differences in temperature and food, while the alternation of generations (q.v.) of the hydroids is directly conditioned by the environment.

Geological Evidence. The age of the earth is approximately estimated to be about 50,000,000 years. Its history is divided by geologists into ages, periods, epochs, etc. It is roughly estimated that about 30,000,000 years have elapsed since the deposition of the lowest fossiliferous rocks—those of Cambrian age. It is believed that this amount of time is sufficient for the origin and development of all the forms of life with which we are thus far acquainted. The stratified rocks are supposed to be about 20 miles thick, the earth's crust about 100 miles in average thickness.

During the enormous space of time since the Cambrian the forces of life and nature have gone on much as at the present time, although the oceans and land masses down to the Glacial period practically had a subtropical climate. Yet there were revolutions, widespread changes of level in the relative distribution of land and

water, so that the map of the world changed greatly at different periods. Hence there must have been successive changes of environment, the conditions of existence were unstable, there were vast migrations, and the founding of new colonies in regions opened up to migration resulting from the subsidence of one region and the elevation of another. Plateaus were elevated, mountain ranges formed, mountain peaks carved out of the mass of folded strata, and thus the entire plateau was finally worn down by the action of the rain and of rivers until the surface formed a peneplain. Such a history of topographical transformation occurred more than once on both the Atlantic and the Pacific coasts of the American continent. All these changes, these revolutions, such as the Appalachian and those of the Glacial period, exerted a profound influence on the flora and fauna. The great lesson of geology is the immensity of time and the ceaseless changes which have taken place in the physical geography of our globe; and these are of prime importance as respects the evolution of life on its surface and the variation of life forms; and yet there were long periods of rest, succeeded by local catastrophes and upheavals, though these so-called "catastrophes," however sudden geologically, may have extended through thousands of years. The breaks, as indicated by local unconformities in the strata of different ages, were confined to comparatively limited areas. So that periods of what we call rapid extinction of life were also periods of the comparatively rapid evolution and specialization of plants and animals.

The changes of level, the great elevation of the land in the Northern and Southern hemispheres, the widespread and profound change of climate which ushered in the Glacial period, and the effect which the geologically sudden lowering of the climate had on plant and animal life, causing extensive migrations and adaptations (as of the polar plants and animals) to their frigid environment, afford signal examples of the effect of geological changes on the extinction of some and the modification of other forms. So also the enormous changes of level which occurred in Mesozoic and Tertiary times, when vast regions of the globe were carried up into the air, so to speak, and the climate changed from a tropical one to that of an elevated, cooler region. The very last changes of level which took place after the melting of the ice sheet, the drainage of continents, and the formation of extensive deserts, accompanied by the adaptation of much plant and animal life to them, should also be taken into account as producing variation.

Evidence from Paleontology. Huxley affirmed that the primary and direct evidence in favor of evolution can be furnished only by paleontology, and its evidence is, indeed, of the strongest nature, the discoveries and conclusions of paleontologists adding each year to the strength of the argument.

There are remains in the Cambrian rocks of 14 classes of marine invertebrate animals and traces of primitive plants. The Cambrian annelids, trilobites, crustaceans, and other class forms are highly developed. Some, as the trilobites, are old-fashioned, generalized types; some of the crustacea are composite or generalized types, as the Phyllocarida; but the annelids are as highly specialized as their representatives of

to-day. The earliest trilobites (q.v.) were blind or eyeless, though they may have descended from eyed forms. These and other facts strongly indicate that the Precambrian, including the Huronian, and possibly the Upper Laurentian ocean, supported an abundant life, made up of protozoans, sponges, and the ancestors of worms, mollusks, arthropods, etc., and most probably of the vertebrates. The Precambrian time was a period of the rapid evolution of types; stratigraphic geology shows that in this formative period there were widespread and rapid changes in the physical geography of the globe.

Another period of the apparently rapid evolution of life forms was the time of the Appalachian revolution, when vertebrates with lungs and limbs appeared, and the forerunners of reptiles, birds, and mammals probably originated. In these early times the Precambrian, as well as the opening ages of the Mesozoic, animal types were more plastic than now; dynamic evolution and use inheritance did their work in the origination of class and ordinal types with comparative suddenness.

Paleontology teaches the fact of the rise, culmination, and death of types; the origin of life from generalized forms and their gradual modification and specialization. It is safe to say that the ancestral forms of most, if not all, the classes of animals began with composite or synthetic types. The geological succession of the arthropod classes, as well as those of the vertebrate phylum, all tell the same story. What morphology and embryology strongly suggest is emphatically confirmed by the series of fossil remains. The origin of reptiles, of birds, of mammals, and of man from generalized types is now placed beyond a reasonable doubt. Familiar examples of those principles or laws of organic evolution are afforded by the genealogy of the horse family (see HORSE, FOSSIL; CAMELIDÆ; etc.), the ox, deer, cat, and other families and orders of vertebrates. And so it is with the phyla into which the arthropods will have to be divided. There are lines of development which have undergone a continual course of modification by the rapid development by exercise of the brain, limbs, and teeth, and the reduction or atrophy of digits or teeth and other hard and soft parts.

On the other hand, certain types have never made any progress and show little advance over their Paleozoic ancestors; such are the Foraminifera, the sponges, the corals, certain mollusks, as nautilus, king crabs, *Lingula*, and even *Oeratodus* and *Hatteria*. Certain arthropods, as *Peripatus*, *Scolopendrella*, and *Campodea*, are probably persistent types.

Geological extinction has been due to obvious causes, such as changes in climate, the elevation of one area and the subsidence of another, as also to the competition with other types. If these causes are quite obvious in their results, it follows that the same causes which led to the extinction of some forms exerted an influence in modifying others. It should be observed that the imperfection of the geological record is still marked, but many gaps have in late years been closed. See EXTINCTION OF SPECIES.

Evidence from Geographical Distribution. The present distribution (q.v.) of plants and animals can only be explained by reference to past geological changes in the shape and proportions of former continental masses and the resulting geological extinction. We can in

many cases only account for the apparently sudden appearance of groups of highly specialized animals in a given area by invoking past migrations. Thus, the camel family (see CAMELIDÆ) originated in western North America, where it has since died out, but is still surviving in South America and Asia. So with the ox family in Eurasia, and the elephants in northeastern Africa, the mammoth (q.v.) having migrated into North America by way of northeastern Asia. This interchange of forms between Eurasia and America, between Asia and Africa, between North and South America, and the changes of climate and other surroundings along the line of march, must have operated in inducing change of habits and variation, and, more especially by isolation, have led to the origin not only of new species and climatic varieties, but to the beginning of new generic and family types. Australia is, in many respects, notably in its characteristic mammals, a Jurassic continent, while Madagascar is a Tertiary island. The moa birds, peculiar to New Zealand, are the result of long ages of isolation and lack of competition with predatory animals.

The various modes of dispersal of organisms and their colonization in remote regions also throw light on the origin of species. The study of deep-sea life is instructive in this connection. It is now generally supposed that the abyssal or benthal fauna originated from shallow-water forms, and that the characters in which these animals differ from those living near the coast are adaptations to life at great depths. Indeed, all the facts and conclusions of zoogeography converge towards the view that, as the different types evidently originated from this or that centre of distribution, so they had common ancestral forms.

Biological Environment. We owe to Darwin and to Wallace the facts and theories epitomized by the terms "natural selection" (q.v.), "struggle for existence," and to Herbert Spencer the expression "survival of the fittest." The competition continually going on between the stronger and the weaker, between original stupidity and acquired wit and cunning, between the plant eaters and the flesh eaters, between parasites and their unwilling hosts, forms a most important chapter in the story of evolution. As soon as, through the action of the primary factors of organic evolution, the ocean began to be peopled with the lowest, most primitive organisms, and when the process of specialization began to operate, then competition between this and that form sprang up, and the struggle for existence—for food, for place, for fixed abodes, or habitats, for a chance to live and multiply and dominate this or that area, and the rivalry of the sexes—set in. The result is *natural selection*, the elimination of the unadapted, of the "unfit," the weak and inept, and the success in life of this or that form which became the founder of some one of the immensely numerous groups of organisms now peopling the globe.

Natural Selection. After the earth became stocked with even a few comparatively simple forms, the selective principles in nature began to operate, resulting in the preservation of the fittest. The factor of natural selection, as stated by Wallace, is based first on "the enormous powers of increase in geometrical progression possessed by all organisms, and the in-

evitable struggle for existence among them"; and, in the second place, "the occurrence of much individual variation, combined with the hereditary transmission of such variations."

Animals tend to increase in enormous numbers, though, owing to the destruction of eggs and young by animals of their own or other species, the earth's population is scarcely greater now than ages ago. When we consider that the cod lays a million of eggs, and that many other animals are nearly as prolific, the species yet being represented by a constant number of individuals, we see that the rate of embryo and infant mortality is astonishingly great. What is called "viability," or the "prospect of life," in man is in the lower animals reduced to almost infinitesimal proportions. A death rate among us of more than 20 in a thousand excites alarm, but think of the death rate in the cod, the bee, and most animals, where it reaches perhaps the figure of 999,998 out of 1,000,000. All this life is not, however, wasted. The young serve as food for other forms of life, and in this way the balance of nature is maintained, the too great increase in organic life is checked, and those that survive and reach maturity are, so to speak, adequately fed and housed. See **LONGEVITY**.

In formulating his theory of natural selection Darwin assumed a tendency to variation, the causes of which he did not discuss at length. This variation, by insensible gradations, is, he believed, fortuitous or "chance," this word serving, he adds, "to acknowledge plainly our ignorance of the cause of each particular variation." The useful variations are those which survive. Natural selection, as Darwin claimed, "leads to divergence of character and to much extinction of the less-improved and intermediate forms of life," and he states: "It leads to the improvement of each creature in relation to its organic and inorganic conditions of life, and consequently, in most cases, to what must be regarded as an advance in organization." See **NATURAL SELECTION**.

Protective Mimicry. Much is said by Darwin, Wallace, Fritz Müller, Bates, and others on this subject, and natural selection appears to play an important part in bringing about protective resemblance. The initial causes of mimicry are the action of light, changes in temperature, etc., which have brought about a variety of patterns of color in insects and other animals of different groups. But it is difficult to account for the resemblance in form as well as coloration between the mimicker and the mimicked unless we invoke the action of natural selection. The disguises of animals, danger signals, the bright spots, lines, bars, and other markings, primarily due, perhaps, to the action of light and shade, have been preserved and exaggerated by natural selection, the process resulting in the preservation of the species thus favored. For further facts and considerations relating to this phase of the subject, see **NATURAL SELECTION**; **MIMICRY**; **PROTECTIVE COLORATION**.

Heredity. The work accomplished by the factors of evolution, including natural selection, would be all lost were the progressively developed characters not transmitted and fixed by heredity. Every one is familiar with the effects of the action of heredity. Its cause has been a mystery, now, however, in part cleared up. See **HEREDITY**; **USE INHERITANCE**.

Parasitism. A very considerable portion of the animal world lives at the expense of its hosts. Whole orders of protozoans, worms, crustaceans, several families of hymenopterous and dipterous insects, numerically rich in species, and members of many other classes, derive their existence by simply living within the bodies of their hosts, or attaching themselves to some external part of their bodies. They infest the blood, the muscles, glands, and, in fact, may invade every organ and tissue in the body. A signal example of the good done by parasitic insects in preventing the overcrowding of the earth with injurious insects is the ichneumon fly (q.v.), a parasite of caterpillars, etc. The competition which is going on in the world of life is perhaps no better illustrated than by the work done by those deadly enemies of animal life, of all grades, the disease germs of bacteria; yet the bacteria are met and devoured by wandering cells, whose mission it is to prey on such germs.

In short, by a study of these parasitic degenerate forms, in many of which there is a loss of limbs and other organs, we readily understand what a potent cause of profound modification by disuse the habit of parasitism may prove to be. In human history the occurrence of individual and racial weakness, backwardness, and decay due to the various forms of parasitic existence, including slavery, is a conspicuous source of physical and moral degeneration, and is exactly paralleled and illustrated among certain social insects. See **ANT**; **INSECT**, *Social Insects*.

The Origin of Man. The proofs of man's origin from some other primate is now past dispute. In fact, no scientist now doubts man's descent, less directly from all lower forms of life, and more immediately from a common ancestor with the anthropoid apes. Anatomically he presents no absolute differences from the anthropoid apes, except in the organs of speech. The relative differences between man and apes are very great, though chiefly confined to the capacity of the skull, the size, number, and complexity of the convolutions of the brain, and the specialization of the forearm in directions ministering to the behests of his brain. He passes through the same embryological phases as the higher mammals. Man's origin from some mammal is strongly attested by the presence in his body of a large number of vestigial characters, which indicate an ancestor that went on all fours—some features appearing shortly before and after birth, hinting at an ape ancestry. The scanty remains of the fossil races, that of Neanderthal or Spy, exhibit some primitive characters, but the discovery of the skull cap, femur, and molar teeth of the Javan so-called "missing link" (*Pithecanthropus erectus*) affords satisfactory evidence of the descent of man from some gibbon-like ape. (See **GIBBON**.) Experts in craniology state that the cranial capacity of this intermediate form is about 1000 cubic centimeters, while that of a few Australian skulls is even less than that (850 cubic centimeters). (See **PITHECANTHROPUS**.) This creature stood erect and was of the average height of man, and the general consensus of opinion is that it is geologically Pleistocene.

Still more significant than any of these is what is now known as the Piltdown skull. Several years ago in Sussex, England, the first fragment was discovered in a bed of gravel, and since that time a skull mosaic has been constructed, which is of the greatest interest. The

Ncanderthal and other early discovered skulls probably represented a race of cave men, very gorilla-like in general, with great brow ridges and low foreheads. Pithecanthropus was more erect and manlike. The Piltown man had a forehead as high as a modern man, but a smaller brain, while the rear of the skull and the lower jaw were little different from those of an anthropoid ape.

At the outset man was a social being; his erect posture, large brain, hands, so well adapted to carrying out the suggestions of his developing intellect, so that he was the first tool maker and worker in stone, bone, and wood, and the first being to tame other animals and to cultivate the soil—these qualities enable him to dominate all other animals. At first living a roving, solitary life as a hunter, tribal communities gradually arose here and there, living in fixed habitations and leading a sedentary life, and the developing man eventually became a herdsman, and after long ages a farmer. Even temporary cessations from intertribal wars were provocative of intellectual growth and permitted the origin and growth of the germs of the arts and sciences. Meanwhile he began to migrate, and became, during the Paleolithic age, scattered over wide areas of the earth's surface. Then ensued a process of isolation by geographical and climatic barriers and the differentiation into races—the black being confined to Africa, the yellow to Asia, the red Indian to the Americas, while the cradle of the white race was in the region now including central and southern Europe, and Africa north of the Sahara and the Sudan.

The more civilized man grew, the more prolific he became. The lowest races early, as a rule, ceased to grow. The yellow races in sub-tropical regions advanced much further in the arts and sciences, but finally remained in a comparatively backward, semifossil condition.

Social Evolution. Up to a certain stage of development—that of the lowest savagery—the evolution of man was due to the action of the same transforming factors as affected lower organic life. The struggle for life, for food, for place, for preëminence, was, however, stronger in the human species than among the animals. Primitive man, his animal passions enhanced by his powerful emotions, stimulated by his growing imagination, his dawning intellectual forces, and his growing self-consciousness, rendered this new creature more cruel, bloodthirsty, and revengeful than the beasts. At first war did not tend to nation building, but was a sporadic outbreak of intertribal inherited hate and revenge, with little result other than brutal sport and exercise. Marriage was little more than animal mating, ownership in property communal, and the primitive spoken language had not arisen out of signs and gestures, through picture writing, into rude alphabets and a written language.

As soon as some scattered tribes had adopted a stationary mode of life, began to cultivate the soil, had domestic animals, and through various necessities made useful inventions, man began to live in a world of new ideas. With fixed abodes, family and tribal customs became handed down, finally becoming laws, and as the result of tribal combats patriotism and the social virtues took root. With ancestor worship, reverence for the dead, ideas of a future life, poetry, art, architecture, sprang up. Commerce was, even in

the earliest ages, as now, a great civilizer, as was ownership in flocks and herds and in land. Man began to have his individual rights, and the germs of morality, or the right relations between man and man, gradually evolved.

As the population of a given tribe or aggregate of tribes increased, there ensued a differentiation of the trades and arts, a separation into political and religious classes, and finally a degree of civilization, of which the Egyptian type was the earliest, in which an alphabet gradually replaced hieroglyphics, and a complicated religious ceremonial and theology superseded savage rites. The new man, with his moral nature enhanced, his imagination aroused, his memories of the past handed down by poets and scalds, his thoughts turning upward and away from animal existence, became gradually, in the noblest specimens of his race, actuated by entirely new sets of ideas, and the factors of his moral development began to act with increasing force.

Religious Evolution. Besides the purely moral factors, all through the course of man's development the religious feelings were constantly active and growing. The lowest savage practices religious rites, worships material emblems of a higher or supreme power, or fetishes which stand for a rude idea of worship, (protection from the ills of life), while the most primitive man has some slight conception of a future life. Yielding to his murderous instincts, the earliest fratricide or thief, reflecting on his crime, would experience self-accusing feelings of remorse, and there would follow the expiation for the crime, or the feeling that one may be saved from the results of wrongdoing by propitiating the higher powers. The functions of the earliest physician, theologian, and philosopher were combined in the first "medicine man" and primitive theology also held the germs of primitive science. At first gross and materialistic conceptions of religion prevailed. Nature worship was succeeded by polytheism, and this by monotheism. Theology has gradually been purified; genuine religion, besides the worship of goodness or God, has developed love for man, and the factors in religious evolution have been faith, hope, and charity, and an increased observance of the "golden rule."

Summary and Conclusion. Life appears to have been a necessary and inevitable result of inorganic or cosmic evolution. It came into being on our planet in the most natural way as soon as the temperature of the originally superheated planetary mass became sufficiently lowered, and the gaseous matter had been condensed into a universal sea. It arose by the action of physicochemical laws, through what we call spontaneous generation, the materials for the formation of the first bit of living protoplasm being ready at hand. When once formed, motion, change, and the action of the primary factors, exerted through a great length of time, resulted in the differentiation or divergence of characters, and specialization went on, conditioned by and dependent on the increasing changes in the internal structure and physical geography of the globe.

Variation was most probably neither fortuitous nor by chance, but was due to changes in the environment, and therefore was necessarily in direct relation with such changes, resulting in the wonderful adaptation, variety, beauty, and harmony reigning through the organic world.

Putting together all the facts of geology and biology observed during the past century, a few

of the more observant and thoughtful naturalists have, by the inductive method, to some extent worked out the mechanism of evolution. The theory is a good working one, indispensable in research. Still, we know only in part the guiding, controlling cause. There seems to be something more than the action of the physical factors and natural selection, which we cannot fathom. There has evidently been all through the process a modifying power, the nature of which science has not yet grasped. The striking fact in the whole course of evolution is that progress has been along certain useful and beneficent lines; that the ill-fitted, inadapted, degenerate, useless, however useful at first, have had to make way for higher forms better adapted to continually changing and improving conditions. Intelligence, mind, order, harmony, system, and good rather than bad conditions have resulted from and operated since the original chaos when physical force, energy, alone prevailed. There is a constant tendency seen in the evolution of the more favored human races towards improvement, intellectual, moral, and spiritual. Epoch-making men, the highest representatives of our race, have shaped the age in which they lived and in various directions given this and that impetus to the upward progress. There has been a directive force through it all, which has controlled and led life forms along definite paths.

Natural selection alone, or the action of the primary factors, cannot entirely account for it. The universe, our world, life, and nature, were not self-evolved. It seems to be a reasonable induction that a self-conscious power and will outside of, and yet immanent in, matter gave the first impress to the nascent universe, what we call natural laws being the mode of working, and in some unknown way providing the germs of self progress along improving lines.

The evolution theory and its implications, therefore, immeasurably enhance our conception of Deity and suggest most strongly that there is a divinity which has shaped our ends. The outcome of the whole is optimism, hope, giving the certitude that man's future will brighten, and that, as the ages roll on, life will be far more worth living than even now.

History of the Evolution Theory. Aristotle (384-322 B.C.) may be regarded as the father of the theory of descent, although Empedocles has been credited with the conception. The latter taught in a vague way the fact of the gradual succession of life forms from the less to the more perfect, though he did not claim any genetic relation, but believed that they were separately created. The wonderfully comprehensive mind of Aristotle, who was the first anatomist, conceived of a genetic series, of a chain of being from polyps to man; he perceived the wonderful adaptation in nature, the principle of the physiological division of labor, and regarded life as the function of the organism, not as a separate principle. He recognized the fact of heredity, atavism, and believed in the inheritance of mutilations.

The nearest approach which the didactic poet Lucretius made to the evolution idea is to be found in his account of the development of the faculties and arts among the human races.

St. Augustine (354-430 A.D.) spoke of the creation of things by series of causes, and Thomas Aquinas (1226-74) expounded and upheld St. Augustine's view. But the idea of

special creation became the universal teaching from the middle of the sixteenth to the middle of the nineteenth century.

That broad-minded early German philosopher Leibnitz (1646-1716) gave examples of the gradation of characters between living and extinct forms as proofs of the universal gradation or connection between species. He believed in a chain of being and that the different classes of animals are so closely united that there are no gaps between them. He also suggested that by means of great changes of habitat "even the species of animals are often changed"; he also taught the doctrine of the continuity of nature and was the author of the saying, *Natura non facit saltum*.

Buffon (1707-88) thoroughly read and was influenced by Leibnitz's writings. Whether or not he owed his evolutionary views to Leibnitz, he stated, and as frequently denied, the mutability of species. He suggested that such changes were directly produced by changes in climate, food, and domestication, and he gave a few examples of the effects of disuse and held that all animals were possibly derived from a single type.

A stronger, more observant, and bolder reasoner than Buffon was Erasmus Darwin (q.v.), the grandfather of Charles Darwin. He was a country doctor, not a working naturalist, but a remarkably close observer and a sound thinker. He claimed that all animals were derived from "a single filament," insisted on the effects of changes of climate, of use, characters being produced by the exertion of animals. He was the first to propose the factor of sexual selection, stated the principle of the law of battle, quite fully elaborated the idea of protective mimicry, and vaguely stated the doctrine of use inheritance.

The true founder of evolution, however, was Lamarck (q.v.), who was the leading zoölogist of the period between Linnæus and Cuvier (1744-1829). In 1801 he first published his evolutionist views. He taught in his lectures (1801-06) and in his *Philosophie zoölogique* (Paris, 1809) that all organisms arose from germs; that development was from the simple to the complex; that the animal series was not continuous, but treelike; and he constructed the first phylogenetic tree. The Lamarckian factors are the changes of environment, climate, soil, food, and temperature, such changes being direct in plants and the lowest animals, indirect in the higher animals. He speaks of the struggle for existence, stating that the stronger devour the weaker, and refers to competition. He discussed at length the effects of use and disuse, taught that vestigial structures are the remains of organs actively used by the ancestors of existing forms, and claimed that new wants or necessities induced by changes of climate, habitat, etc., result in the production of new propensities, new habits, and new functions. Change of habits, he says, originate organs, change of functions create new organs, and the formation of new habits precedes the origin of new organs or modification of organs already formed. He refers to the swamping effects of crossing, and to isolation as a factor. His definition of species is the most satisfactory yet stated. Lamarck's views were not generally accepted, but misrepresented or ignored, largely through the influence of Cuvier and his disciples. See LAMARCKISM; NEO-LAMARCKISM.

Notwithstanding this history, it was reserved

for Charles Darwin, in 1859, seconded by A. R. Wallace, to convert the scientific world to evolutionary views. The new theory he specially advocated was that of natural selection. Darwin claimed that there was a universal tendency of fortuitous variation; its causes, he thought, were only in part known. He showed that favorable variations were preserved and that natural selection has a directive force. He dwelt convincingly on the facts of competition, of the struggle for existence, and on the biological environment. At the same time his *Origin of Species* was a massive and irresistible argument for the doctrine of descent; and as further expounded and upheld by Hooker, Huxley, Fritz Müller, Haeckel, and others, it became generally accepted. Darwin was the prince of observers and experimenters. He was also an expert systematist, a clear, persuasive writer; and into whatever field he entered his work was epoch-making.

Meanwhile in England, as early as 1852, Herbert Spencer advocated evolution from a philosophical point of view. He proposed the term "evolution" both for the inorganic and organic world. His broad, synthetic mind grasped the full significance of cosmic evolution, and he extended the doctrine of descent to human history, human society, morals, ethics, and religion. He is the philosopher of science and of all that pertains to man. He has worked rather along Lamarckian lines, holding that natural selection as such was of secondary importance, as compared with the primary factors of organic evolution.

After Darwin's death, under the leadership of Alfred Russel Wallace, and especially of Weismann, the school of Neo-Darwinism (q.v.) arose. Weismann, distinguished by his great work on the embryology and metamorphism of insects, and his investigations on temperature forms, has shown that heredity has a physical basis, the chromatin being the bearer of heredity. He asserts the "all-sufficiency" of natural selection and claims that variability is due to sexual reproduction.

The mutation theory of De Vries does not attempt to supplant natural selection, Weismannism and Mendelianism, but complements these. Like the latter theory, it emphasizes the importance of the congenital hereditary characters contained in the germ plasm. It differs from the Darwinian theory in holding that the new forms occasionally arise by great leaps, in place of the slow accumulation of slight fluctuating variations. The old Lamarckian doctrine of the inheritance of acquired characters, at least in its direct application, is rapidly losing ground.

In some directions we find the theory of orthogenesis becoming stronger. This was originally sponsored by Nägde and Eimer, and holds that evolution is less the result of chance than by direct linear progressive modification.

Even with all these theories, we find much of the mystery of evolution still unsolved. In one of the most recent reviews of the subject, Bateson's *Problems of Genetics*, we find almost more destructive than constructive theories and arguments. But the intensive study now being brought to bear on every aspect of the problem cannot fail to yield results of great importance in the near future.

EVOLUTION (IN MATHEMATICS). See **IN-VOLUTION AND EVOLUTION.**

EVOLUTIONS, MILITARY. The movements by which bodies of troops are enabled to change position, order, or formation. The term embraces such movements as changes of front, formations of line, column, échelon, or square. While the primary principles of scientific warfare remain practically the same, the modern developments of artillery and musketry fire have greatly affected the dispositions of battlefields and consequently changed the essential principles involved in preparations for war. The ability of infantry, e.g., to wheel accurately, coolly, and with precision, or deploy in front of the enemy, with the steady deliberation of the parade ground, formerly so much admired, is to-day re-

placed completely by widely extended intervals and distances in all fighting formations. Changes of front are now made speedily, the men moving by the shortest possible direction to their new front. In brief, the spirit of the old order of military evolution was to stamp out all individuality in the rank and file, making of the soldier an automaton of little or no value as a separate entity. Modern evolutions, on the other hand, magnify the individual, encourage individuality, and from time to time decrease the tactical unit of command. See **TACTICS, MILITARY.**

ÉVORA, á'vô-rá. A city of Portugal, capital of the Province of Alentejo, situated in a fertile and elevated plain, 75 miles east by south of Lisbon (Map: Portugal, B 3). It is irregularly built, with narrow streets, and is protected by old walls and towers and some recently constructed fortifications. It contains remains of great historic interest. The Gothic cathedral dates from the twelfth century and has considerable architectural beauty. Of Roman antiquities there are a ruined temple (unwarrantably called the temple of Diana), with fine Corinthian columns, and an old aqueduct (rebuilt) which supplies the city with water. Evora has been the seat of an archbishop since the sixteenth century and has an archiepiscopal library with about 25,000 volumes and 2000 manuscripts and a number of paintings. The archaeological museum is one of the most interesting in Portugal. The town has cotton and woolen manufactures and iron furnaces. It carries on a considerable trade in wine. Pop., 1890, 15,134; 1900, 16,152; 1911, 17,901. Evora, the ancient Ebora, was captured by the Romans in 80 B.C. and became a colony with the name *Liberalitas Julia*. It was taken by the Arabs in 712, but was recovered by the Christians in 1166.

ÉVREUX, á'vrø. The capital of the Department of Eure. An episcopal city of Normandy, France, on the Iton, an arm of the Eure, 67 miles west-northwest of Paris (Map: France, N., G 3). It is an old-fashioned town, with wide streets and numerous promenades. Its principal building, the cathedral of Notre Dame, which dates from the eleventh century, is a composite of various styles of architecture. The north portal, built in sixteenth-century flamboyant style, is especially fine. Other buildings include the abbey church of St. Taurin, originally built over the tomb of St. Taurin, the first Bishop of Evreux, a thirteenth-century shrine; the bishop's palace, built in 1481; and the Tour de l'Horloge (clock tower) of the same century. Evreux has a botanical garden, a lycée, a library of 21,000 volumes, and a small museum situated in the town hall, which contains relics found at Viel Evreux. Its educational institutions are two theological seminaries, a teachers' college, and a school of design. Evreux manufactures linen, shoes, gas engines, metal ware, pianos, leather, meal, mustard, and has an extensive business in grain. Pop. (commune), 1901, 18,292; 1911, 18,957. It was taken by Clovis from the Romans, was sacked and plundered in 892 by the Northmen under Rollo, was burned by Henry I of England in 1119, and in 1194 and again in 1199 was captured by Philip Augustus, King of France. It was frequently taken and retaken in the wars of the fifteenth century between France and England.

VIEIL EVREUX (*Old Evreux*), a village near Evreux, is the site of ancient Mediolanum and has remains of a theatre, an aqueduct, baths, and fortifications. Pop., 1901, 275; 1911, 253.

EWALD, a'vål, CARL (1856-1908). A Danish novelist and poet, born in Schleswig. After the War of 1864 the family moved to Copenhagen, where Carl was educated at the University. For a time he served as a forester, but after 1887 he devoted himself to his literary work. At first he published school books and made translations. In his novel *Den gamle Rum* (Eng. trans., *The Old Room*, 1908) he portrays the character change of a man who deserted a conventional life for one of freedom; and in its sequel, *Cordt's Son* (Eng. trans., *Cordt's Son*, 1908), he shows the life of a man who strictly observed all the social conventions. He is also author of *Singleton's Udenlandsrejse* (1894); *Glaede over Denmark* (1898); *Sulasmiths Have* (1898); *Der Kinderkræuzzug* (1896; Ger. trans., 1899); *Mein Kleiner Junge* (1899; Eng. trans., 1906); *Crumlin* (1900). Alexander T. de Matos translated others of his works under the following English titles: *My Little Boy* (1906); *Two-Legs* (1906); *The Spider and Other Tales* (1907); *The Pond and Other Stories* (1909); *The Four Seasons* (1913).

EWALD, a'vålt, GEORG HEINRICH AUGUST VON (1803-75). A German Orientalist and theologian. He was born and educated at Göttingen and in 1823 was appointed instructor in the gymnasium of Wolfenbüttel. In the following year he was made lecturer in the theological faculty of Göttingen, and three years later he became professor extraordinarius of Oriental languages. His full professorship was granted him in 1831. Having become involved, together with the brothers Grimm, Dahlmann, Gervinus, Albrecht, and Weber in the protest against the abrogation of the constitution which the King of Hanover had been obliged to grant in 1830, Ewald was removed from his professorship in 1837. He went in the following year to Tübingen as professor in the philosophical faculty, from which he changed in 1841 to the theological. Here, however, he became involved in controversies with the Catholics, Hegelians, and Pietists. He left Tübingen after having been ennobled by the King of Württemberg and was reinstated in his old position at Göttingen in 1848. For many years, in addition to his professorial duties, Ewald was engaged in active support of the movement for Protestant reform in Germany. After Hanover was annexed to Prussia, in October, 1866, his loyalty to the dethroned dynasty caused him to refuse to take the oath of allegiance to the King of Prussia. As a result of this decision, expressed with great vigor and bitterness, he was removed from his position, and pensioned in 1868. Ewald represented repeatedly the city of Hanover as a member of the Guelph faction in the North German and German diets.

Ewald wielded an immense influence as a scholar, and his learning was profound. He did much for Hebrew scholarship and for the critical study of Hebrew history. His *History of Israel* was the most influential work on the subject in his generation. His writings, excepting his expressions on political subjects, which were merely temporary in their interest, were almost entirely on the Old and New Testaments and on Arabic. Among those on Hebrew philology and theology are his *Ausführliches Lehrbuch der*

hebraischen Sprache (8th ed., 1870); *Hebraische Sprachlehre für Anfänger* (4th ed., 1874); *Geschichte des Volkes Israel* (7 vols., 3d ed., 1804-70); *Die Altertümer des Volkes Israel* (3d ed., 1806); and *Die Lehre der Bibel von Gott oder Theologie des alten und neuen Bundes* (4 vols., 1871-78). The principal works on other Semitic languages are: *Grammatica Critica Linguae Arabicae* (2 vols., 1831-33); *Abhandlung über des äthiopischen Buches Henókh Entstehung* (1854); *Ueber die phonikischen Ansichten von der Welterschöpfung und den geschichtlichen Wert Sanchumathons* (1857). Of a more miscellaneous character are his *Sprachwissenschaftliche Abhandlungen* (3 parts, 1861-71); *Verzeichnis der orientalischen Handschriften der Universitätsbibliothek zu Tübingen* (1839); *Ueber einige ältere Sanskritmetra* (1827). Ewald was also the founder (1837) and one of the editors of the *Zeitschrift für die Kunde des Morgenlandes* as well as of the *Jahrbücher der biblischen Wissenschaft* (1849-65). The following have been translated into English: *Hebrew Grammar* (1870); *History of Israel* (1867-74); *Antiquities of Israel* (1876); *Commentary on the Prophets* (1870-77); *Isaiah* (1869); *Life of Jesus Christ* (1865). Consult Cheyne, *Founders of Old Testament Criticism* (London, 1893).

EWART, ū'art, DAVID (1843-). A Canadian architect. He was born near Edinburgh, Scotland, and was educated there at the public schools and at the Edinburgh School of Arts. He came to Canada and in 1871 was appointed assistant to the assistant engineer and architect of the Department of Public Works, Ottawa. In 1897 he was appointed chief architect of the department. Among his works are the completion of the main tower of the Dominion Parliament buildings, Ottawa, and the Canadian buildings at the Paris Exposition and at the Chicago World's Fair. In 1903 he received the decoration of the Imperial Service Order. In 1906 he was appointed a member of the board of assessors, with respect to the new departmental buildings at Ottawa. In 1909 he became a councillor of the Royal Architectural Institute of Canada.

EWART, ū'art, JAMES COSSAR (1851-). A Scottish naturalist, born in Penicuik, Midlothian. He was educated at Edinburgh University and in 1874 was demonstrator of anatomy there. In 1875-78 he was conservator of the London University College Museum, in 1878-82 was professor of natural history at Aberdeen, and in 1882 became Regius professor at Edinburgh. He started a marine station near Aberdeen in 1879, in 1882-92 was prominent in scientific work in connection with fisheries, and devoted his later years to the study of horses and especially to experiments at Penicuik in hybridization of horses, zebras, and donkeys, which were of particular importance as disproving telegony. His publications include: *Locomotor System of Echinosaurus* (1881), with G. J. Romanes; *Fish Culture in America* (1884); *On the Preservation of Fish* (1887); *The Electric Organ of the Skate* (1888-89); *The Development of the Limbs of the Horse* (1894); *The Penicuik Experiments* (1899); *Multiple Origin of Horses and Ponies* (1904); *On a Prejavalsky Hybrid* (1907).

EWART, JOHN SKIRVING (1849-). A Canadian lawyer and publicist. He was born in Toronto, was educated at Upper Canada College, studied law, and was called to the bar in

1871. Until 1882 he practiced his profession in Toronto, then until 1904 in Winnipeg, and after that in Ottawa, where he took rank as one of the leaders of the bar. In the prolonged educational and religious contest over the Manitoba school question (see *MANITOBA, History*) Ewart represented the Roman Catholic minority, defending separate schools, not only in the courts, but in leading periodicals. He wrote several legal works of a technical character, and in 1883-90 edited and published reports of cases before the Manitoba courts. After 1900 he paid special attention to the political questions which arose in consequence of the increased importance of Canada as a member of the British Empire. He strongly opposed imperialistic views. In 1910 he was chief counsel for Canada before The Hague tribunal. In addition to the legal works before mentioned, he published: *The Kingdom of Canada and Other Essays* (1908); *Sir John Macdonald and the Canadian Flag* (1908); *Canadian Independence* (1911); *The Kingdom Papers* (1912).

EWART, WILLIAM (1848-). An English physician, born in London. He was educated at Paris, at Berlin, and at Cambridge, where he was scholar of Gonville and Caius College. He was examiner and Goulstonian lecturer to the Royal College of Physicians and assistant physician to the Brompton Hospital for Consumption, besides being consulting physician to many hospitals. He specialized in diseases of the heart and the lungs, and wrote: *Pulmonary Cavities* (1882); *Cardiac Outlines* (1892); *Heart Studies, Chiefly Clinical* (1894); and the articles "Bronchitis" and "Bronchiectasis" for Allbutt and Rolleston's *System of Medicine*, and a part of the Royal Medical and Chirurgical Society's *Report on Climatic and Baths of Great Britain*, vol. ii (1902).

EWBANK, ū'bank, THOMAS (1792-1870). An American scientist and writer. He was born in Durham, England, but emigrated to America about 1819 and from 1820 to 1836 was engaged in the manufacture of metallic tubing. From 1840 until 1852 he was United States Commissioner of Patents. Among his publications are: *A Descriptive and Historical Account of Hydraulic and Other Machines, Ancient and Modern* (1842; 15th ed., 1863); *The World a Workshop, or the Physical Relation of Man to the Earth* (1855); *Life in Brazil* (1856); *Thoughts on Matter and Force* (1858); *Reminiscences in the Patent Office* (1859); *Inorganic Forces Destined to Supersede Human Slavery* (1860).

EWE. A speech group of pagan negro peoples on the slave coast of Africa in Dahomey and Togoland. Keane gives the following list of peoples speaking dialects of Ewe: *Awuna, Avenor, and Ataklu*, 45 miles inland on the Volta; *Aghosimi, and Aflao*, coast from Volta to Togoland; *Krikor*, north of Aflao; *Togo*, coast of Togoland; *Geng*, Porto Seguro and Little Popo, Great Popo, between Little Popo and Whydah; *Dahoman*, inland between Great Popo and Kotonu; *Ewemi*, north of Kotonu; *Fra and Appi*, from Kotonu to Yoruba frontier; *Anfueh, Krepe, and Ewe-Awo*, Togoland; *Mahi* (Makki), *Affakpami, Aja*, north and west of Dahoman. It is probable that the Ewe came from the northeast (possibly Borgu or Gurma) only a few centuries ago. Their culture is typically West African. They depend for food mainly on agriculture, the chase being monopolized by a special

caste. Juridical procedure is highly developed, and there is an unusual complexity of religious conceptions. Consult: Keane, in *Stanford's Africa*, vol. i (London, 1895); Ellis, *The Ewe-Speaking Peoples of the Slave Coast of West Africa* (ib., 1890); Spieth, *Die Ewe-Stämme* (Berlin, 1906).

EWELL, ū'el, ARTHUR WOOLSEY (1873-). An American physicist. Born at Bradford, Mass., he graduated from Yale University in 1897 (Ph.D., 1899) and also studied at Johns Hopkins and the University of Berlin. He was instructor in physics and assistant professor at Worcester (Mass.) Polytechnic Institute between 1897 and 1910, when he became professor. He became a fellow in the American Academy of Arts and Sciences. He is author of *A Text-Book of Physical Chemistry* (1909); *Physical Measurements* (1910; 2d ed., 1913); *Artificial Rotatory Polarization* (1911).

EWELL, BENJAMIN STODDEBT (1810-94). An American educator, brother of Richard Stoddert Ewell. He was born in Washington, D. C., and was educated at West Point, where, after graduating in 1832, he was an instructor in mathematics until 1836. After three years as assistant engineer of the Baltimore and Susquehanna Railroad he became professor of mathematics at Hampden-Sidney College, Virginia, remaining there until 1846, and from 1846 to 1848 he held a similar position at Washington University, Lexington, Va. In the latter year began his long connection with William and Mary College, which ended only with his death. First elected to the chair of mathematics, he became president in 1854, a position which he held until 1888, save for the interval of the Civil War, in which he served in the Confederate army as colonel of a Virginia regiment and as adjutant general on the staff of Gen. Joseph E. Johnston. From 1888 until his death he was president emeritus.

EWELL, MARSHALL DAVIS (1844-). An American lawyer, born at Oxford, Mich. He graduated from the Michigan State Normal School in 1864 and from the University of Michigan Law School in 1868. In 1877 he became professor at the Union College of Law in Chicago, and later he founded the Kent College of Law, of which he became professor, president, and dean. In 1890-96 he lectured on medical jurisprudence at the University of Michigan. He also became known as a handwriting expert and microscopist and was president of the American Microscopical Society (1893, 1906) and of the Illinois Microscopical Society (1909, 1911). He edited *Blackwell on Tax Titles, Evans on Agency, and Lindley on Partnership*, published some 200 papers in scientific and law journals, and is author of *Leading Cases on Disabilities* (1876); *Treatise on the Law of Fiatures* (1876; 2d ed., 1905); *Essentials of the Law* (1882); *Manual of Medical Jurisprudence* (1887; 2d ed., 1909); *Essentials of Commercial Law*, with Whigam and Skinner (1913).

EWELL, RICHARD STODDEBT (1817-72). An American Confederate soldier, brother of Benjamin Stoddert Ewell. He was born at Georgetown, D. C., graduated at West Point, and was assigned as lieutenant of dragoons in 1840, and served in the Mexican War, participating in the engagements at Contreras and Churubusco. He attained the rank of captain, took part in the suppression of the Apache outbreak in 1857, and, on the outbreak of the Civil War, in 1861, resigned

his commission and entered the service of the Confederacy, being actively engaged throughout the war. As a major general, he commanded a division at the first and second battles of Bull Run, at Antietam, and under Jackson at Warrenton Turnpike, where he was severely wounded. After the death of Jackson at Chancellorsville he succeeded to his command with the rank of lieutenant general, took part in the battles of Gettysburg and the Wilderness, and was finally captured with his entire corps by Sheridan, at Sailor's Creek, April 6, 1865. After the war he lived in retirement.

EWER, U'ER, FERDINAND CARTWRIGHT (1826-83). An American clergyman of the Protestant Episcopal church. Born at Nantucket, Mass., he graduated at Harvard in 1848, in 1849 became a journalist in California, and in 1858 was ordained a priest of the Protestant Episcopal church. In 1858-60 he was rector of Grace Church, San Francisco, Cal.; in 1860 he was appointed assistant minister of St. Ann's Church, New York City, and in 1862 rector of Christ Church. Because of his extremely ritualistic innovations he occasioned a disturbance in the parish and found it best to resign. In 1871 he became rector of St. Ignatius' Church, which was organized for him by his friends and sympathizers, and in which he developed very elaborately his ideas regarding the conduct of the service. His publications include: *Two Eventful Nights or the Fallibility of Spiritualism Exposed* (1856); *Sermons on the Failure of Protestantism* (1869); *Catholicity in its Relations to Protestantism and Romanism* (1878); *Grammar of Theology* (1880).

EWING, U'ing, FINIS (1773-1841). An American clergyman, a founder of the Cumberland Presbyterian Church. He was born in Bedford Co., Va., whence he removed to Tennessee and later to Kentucky. In 1802 he was licensed to preach by the Cumberland presbytery and for several years thereafter labored with much success as a revivalist. He formed, with two other clergymen, in 1810, the presbytery from which the Cumberland Presbyterian Church was developed. He was subsequently pastor at New Lebanon (Cooper Co.), Mo., in 1820-36, and at Lexington (Lafayette Co.) in the same State from 1836 until his death. His *Lectures on Important Subjects in Divinity* appeared in 1824. Consult Cossitt, *Life and Times of Finis Ewing* (Nashville, 1853).

EWING, HUGH BOYLE (1826-1905). An American lawyer, soldier, and diplomat, son of Thomas Ewing. He was born at Lancaster, Ohio, studied at West Point, in 1849 went to California by way of New Orleans and Texas, and upon his return in 1852 studied law, which he practiced at St. Louis, Mo., in 1854-56, and at Leavenworth, Kans., in 1856-58. In 1861 he entered the United States army as brigadier inspector of Ohio Volunteers. He commanded a brigade at Antietam and Vicksburg, and at Chattanooga the division which constituted the advance guard of Sherman's army, and took Mission Ridge after a desperately contested struggle. He was appointed a brigadier general in 1862 and brevetted major general in 1865. From 1866 to 1870 he was United States Minister to The Hague. His publications include *A Castle in the Air* (1887) and *The Black List* (1893).

EWING, JAMES (1866-). An American pathologist, born at Pittsburgh, Pa. He gradu-

ated from Amherst College in 1888 and in 1891 from the College of Physicians and Surgeons (Columbia University), where, after further study in Vienna, he was tutor, fellow, and instructor (1893-99). In 1899 he became professor of pathology at Cornell University Medical School. He was president of the Association for Cancer Research in 1907 and of the Harvey Society in 1908. He is author of *Clinical Pathology of Blood* (1901; 2d ed., 1903); "Identity," "The Signs of Death," and "Sudden Death," in the *Text-Book of Legal Medicine and Toxicology* (1903); "Blood," in the *Text-Book of Legal Medicine* (1910).

EWING, SIR (JAMES) ALFRED, K.C.B., F.R.S. (1855-). A Scottish physicist and engineer. He was born at Dundee, March 27, 1855, and was educated at the Dundee high school and the University of Edinburgh. For several years he was assistant to Lord Kelvin and Prof. Fleeming Jenkin. In 1878 he was appointed professor of mechanical engineering in the Imperial University of Tokyo, and while in Japan he devoted himself assiduously to the study of earthquakes, devising seismographs to record the earth's vibrations during such disturbances. In 1883 he resigned to become a professor of engineering in the University College, Dundee, and from 1890 to 1903 he was professor of mechanism and applied mechanics in the University of Cambridge. From 1903 to 1906 he was a member of the Explosives Commission and a member of the Ordnance Research Board, 1906-08. In 1907 he was made C.B., and K.C.B. in 1911. He is the author of a treatise on *Magnetic Induction in Iron and Other Metals* (1891), a work which followed a series of researches in the various phenomena of magnetism published in the *Philosophical Transactions* and the *Proceedings of the Royal Society*. Professor Ewing invented a magnetic curve tracer, a hysteresis tester, and a permeability bridge, which are used by electrical engineers and steel makers in testing the iron employed in the construction of dynamos and transformers. His work on earthquakes resulted in the publication of *Earthquake Measurement* by the University of Tokyo in 1883, and other papers by the Seismological Society of Japan. He also wrote: *The Steam Engine and Other Heat Engines* (1894); *The Strength of Materials* (1899); *The Mechanical Production of Cold* (1908).

EWING, JULIANA HORATIA (1841-85). An English writer of stories for children. She was born at Ecclesfield, Yorkshire, England, where her father, Alfred Gatty, was vicar. Her mother was Margaret Gatty, who wrote *Aunt Judy's Tales* (1858) and other stories and started *Aunt Judy's Magazine* (1866). After the death of Mrs. Gatty (1873) the magazine was conducted for two years by Juliana and her sister. In the meantime (1867) Juliana had married Major Alexander Ewing, of the army pay department. Mrs. Ewing wrote her first story, *A Bit of Green*, for the *Monthly Packet* (July, 1861), but most of her work was contributed to her mother's magazine. Among her many tales are: *Mrs. Over-the-Way's Remembrances* (London, 1869); *The Brownies* (ib., 1870); *Six to Sixteen* (ib., 1876); *Brothers of Pity* (ib., 1882); *Jackanapes* (ib., 1884). She died at Bath, May 13, 1885. Consult H. K. T. Gatty, *Juliana Ewing and her Books* (London, 1885).

EWING, THOMAS (1789-1871). An American statesman, born in Ohio Co., West Va.

He graduated at Ohio University (Athens, Ohio) in 1815. The year following he studied law and was admitted to the bar at Lancaster, where he began his practice. In 1831 he was elected as a Whig to the United States Senate. He was a strong advocate of the recharter of the United States Bank and protested vigorously against the action of Jackson in withdrawing the government deposits from it, and after the "specie circular" of Secretary Woodbury was issued in 1836 proposed a measure for its annulment. After the expiration of his senatorial term in 1837 he resumed the practice of his profession, but served as Secretary of the Treasury from March till September, 1841, when he retired because of the differences between President Tyler and the Whig party. In 1849 Ewing again entered the cabinet, this time as the first Secretary of the newly established Department of the Interior. In June, 1850, he was appointed by the Governor of Ohio a United States senator, to serve the unexpired term of Thomas Corwin, who had resigned to enter Fillmore's newly constituted cabinet as Secretary of the Treasury. He remained in the Senate until 1851. He was a delegate to the Peace Congress at Washington in 1861, but unreservedly supported the Lincoln administration during the Civil War.

EXAMINATION (Lat. *examinatio*, from *examinare*, to examine, from *examen*, tongue of a balance, from *exigere*, to weigh, from *ex*, out + *agere*, to lead). The process of testing a student or a candidate from some scholastic, professional, or other position, with the purpose of discovering either the proficiency that has been attained in certain lines of study and of knowledge possessed or the capacity for doing certain lines of work in the future. Both of these purposes may enter into an examination and usually should, for it is the minimizing of the latter purpose that has caused so much criticism of the scholastic custom. The use of examinations as a test of fitness for civil service is discussed under the title **CIVIL SERVICE**. Aside from the Oriental, especially Chinese, civilization, which has had no educational influence on the West, the use of examinations as a scholastic test seems to have begun in the mediæval universities, where the conferring of the baccalaureate degree was conditioned upon the ability to define and explain terms before a company already possessed of the degree, and of the mastership or doctorate upon the ability to "dispute" or to defend a thesis before a group or a faculty, each member of which was possessed of the degree sought. Since then examinations have become a practice of every part of the modern educational system, both as a test of the completion of the component part of the system, and as a test of fitness for admission into more advanced parts of the general system or into specific institutions.

It is the confusion of the two purposes that has given rise to some of the most complicated problems of modern education, chiefly because the test of a completed portion of work can become, even if not necessarily so, largely an exercise in memory, while the test of ability to undertake other and more advanced lines of work may have little relation to the excellence of the memorizing activities or to the possession of mere information. The use of examinations in the former sense may be extended so as to furnish a test of the standing or even of the financial support to be given to institutions. In this

latter application it forms a feature of the public-school system of the State of New York, and as "payment by results" was the chief feature of the elementary school system of England until the close of the last century and is still to a large extent characteristic of the Irish educational system. When used as a test of knowledge, especially when some exterior end is sought, examinations may lead to serious injury to educational work: the work of instruction becomes formal, the intellectual discipline is superficial, and the information acquired is soon forgotten. When the passing of examinations becomes a prominent motive, the higher purposes and aims in education are lost sight of. These difficulties in connection with the uses of examinations are met in different ways. In England examination by competent inspectors has been substituted as a test of the quality of the work done in both elementary and secondary schools. There is also a tendency to introduce the oral interview in some examinations, e.g., for entrance into the naval colleges. In the elementary grade of the American public schools the recommendation of the teacher, based upon an intimate knowledge of the work of the child, is a partial if not a complete substitute for the multitude of examinations formerly given. For the very burdensome college entrance examination, both certification by schools and a combination of secondary school finals and college entrance examinations through a general board are being widely substituted. See **COLLEGES**, **AMERICAN**; **OXFORD UNIVERSITY**; **CAMBRIDGE UNIVERSITY**; **NATIONAL EDUCATION**, **SYSTEMS OF**. Consult: Hadley, *The Education of the American Citizen* (New York, 1901); Latham, *The Action of Examinations* (Boston, 1886); Herbert, *The Sacrifice of Education to Examination* (London, 1889); Monroe, *Cyclopedia of Education*, s. v. *Examinations* (New York, 1911).

EXAMINATION. In judicial proceedings, the process by which the testimony of witnesses is elicited and sifted. It is ordinarily conducted by the counsel for the parties, although the trial judge has the right to ask questions of a witness at any time. The first examination on behalf of the party calling the witness is known as the direct examination, that on behalf of the opposite party as the cross-examination, and any further questioning by the first party is called redirect examination. As a rule, the party calling a witness has no right to ask leading questions, i.e., questions which suggest to the witness the answers which are desired by the examiner. It is the duty of the court to see that witnesses receive decent and respectful treatment from counsel. For a further discussion, see **EVIDENCE**; **WITNESS**; **TORTURE**; **ETC.**; and consult the authorities there cited; also Ballantine, *Experiences of a Barrister's Life* (New York, 1883).

EXAMINATION, PHYSICAL. In legal proceedings, the medical or surgical examination of a living person by judicial order or as a part of legal proceedings to determine the existence or the nature of a physical injury alleged to exist, or of a physiological condition upon which the rights of a party to the proceeding may depend. It is especially available in actions for personal injury due to willful violence or to negligence, and in cases of abortion, malpractice, and rape. Whether a court of justice has the power to compel a party to an action to submit to a physical examination is a question upon which judi-

cial decisions are at variance. It has been answered in the negative by the United States Supreme Court and by courts of last resort in several of the States, while an affirmative answer has been given by many State tribunals. The power has been denied on the ground that the right of every individual to the possession and control of his own person is held sacred and carefully guarded by the common law. That right, it is said, is as much invaded by a compulsory stripping and exposure as by a blow.

Other courts have affirmed the existence of this power, on the ground that the end of litigation is justice, and that whenever the physical examination of a party litigant is necessary to the ascertainment of the truth and the award of justice, such examination may be ordered. The latter view has received statutory sanction in some of our States. (See chap. 721, N. Y. Laws, 1893.) Even where this view prevails, the exercise of the power in a given case is a matter of judicial discretion. A party has not the absolute right to compel his opponent to submit to a physical examination; and a court will order such examination only when the necessities of the case require it, and when it can be made without danger to the party's life or health, and without the infliction of serious pain. Consult Watson, *On Damages for Personal Injuries* (Charlottesville, 1901).

EX'ANTHE'MA (Lat., from Gk. ἐξάνθημα, eruption, from ἐξέρθεῖν, *exantheîn*, to blossom out, from ἐκ, *ek*, out + ἄνθος, *anthos*, flower). A name applied to a class of febrile diseases (*exanthemata*) attended by distinctive eruptions on the skin, appearing at a definite period, and running a recognizable course. To this class belong smallpox, chickenpox, measles, German measles, typhoid fever, scarlet fever, typhus, and erysipelas (q.v.). See FEVER.

EX'ARCH (Lat. *exarchus*, from Gk. ἑξαρχος, *exarchos*, leader, from ἐξάρχεω, *exarchein*, to lead out, from ἐξ, *ex*, out + ἀρχεῖν, *archein*, to lead). A title applied early in the sixth century to any officer in the Byzantine army, but restricted in the last decade of the century to the military governors in Italy and Africa. Because of the troubled conditions in those two countries the *exarch* had to be given absolute civil as well as military power. The *Exarch* of Italy, who resided at Ravenna (q.v.), ratified the election of the Bishop of Rome, controlled the finances, judged all appeals, and made all official appointments. For the end of the *exarchate* in Italy, see AISTULF. In the Christian Church *exarch* was originally a title of the bishops, afterward of a bishop who presided over several others—a primate. After the Council of Chalcedon it was used as a title higher than metropolitan, but lower than patriarch. The *exarch* of monasteries was an official charged with the maintenance of discipline. The same title is also borne, in the modern Greek church, by the person who "visits" officially, as a legate of the patriarch, the provincial clergy and churches. Consult Diehl, *Etudes sur l'administration byzantine dans l'exarchat de Ravenne* (Paris, 1888), and Ducange, *Glossarium ad Scriptores Medios et Infimos Græcitas* (Paris, 1688).

EXARCH. See *Vascular System*, under MORPHOLOGY OF PLANTS.

EXCALIBUR. The famous sword of King Arthur (q.v.). It was bestowed upon him in accordance with the promise of Merlin, by the Lady of the Lake, and at his death thrown by

one of his faithful knights back into the waters of the lake, where it was grasped and borne beneath the surface by a mystic hand. Consult Tennyson's *Idylls of the King*.

EX CATH'EDRA (Lat., from the chair). A phrase originally used with reference to the decisions of the Pope or others high in authority, who, literally speaking, pronounced their judgments *ex cathedra*. The expression is often used generally, meaning to speak with complete authority. In the definition by the Vatican Council of papal infallibility the expression is used as one of the limitations of the doctrine. The Pope is held to be infallible only when, among other things, "he speaks *ex cathedra*, i.e., when in the discharge of his office of pastor and teacher of all Christians, in virtue of his supreme apostolic authority, he defines a doctrine regarding faith or morals to be held by the whole Church."

EXCAVATING MACHINERY (from Lat. *excavare*, to hollow, from *ex*, out + *cavare*, to hollow, from *cavus*, hollow). This term embraces mechanical devices for excavating and loading earth used in the construction of railways, canals, reservoirs, etc. The two most important classes of excavating machines are dredges and steam shovels, which are described under those titles. The ordinary drag scraper is one of the simplest forms of excavating machine; wheel scrapers are, roughly speaking, drag-scraper bodies mounted on two wheels to facilitate their movement. Drag and wheel scrapers, which may be modified in various ways, usually are hauled by horses and require a man to load and dump them. Scrapers of large size are sometimes arranged to be operated by cables, the cables being so arranged and so manoeuvred by a steam engine that they automatically fill, haul, dump, reverse, and return the scraper just as these operations are performed by hand and horse power. A form of excavating machine called a grader, which is much used, consists of a four-wheeled vehicle with a strong frame from which a peculiar form of plow is rigidly suspended. This plow turns the earth on to a traveling belt, which extends diagonally upward at one side of the vehicle so that a wagon may be driven under its upper end to receive the discharge. Grapple-bucket excavators and continuous chain-bucket excavators have been developed from dredges of this type and quite extensively used. Special forms of excavators with buckets designed for the material to be handled are in operation both in connection with traveling cranes and with cableways, and these are extensively used in all kinds of excavation. The grapple dredge usually has buckets of the orange-peel or the grab-bucket type, where two quadrants of a cylinder are so hinged that after being lowered into the material they may be brought together and then the load raised by another cable or chain. For ditching and trenching drag-line excavators are employed, with buckets of various types, as well as some form of continuous chain-bucket excavator which can be used in dry excavation as well as wet. See DREDGE; ROAD AND STREET MACHINERY; STEAM SHOVEL. Consult Merriman, *American Civil Engineer's Pocket Book* (2d ed., New York, 1913), and McDaniel, *Excavating Machinery* (New York, 1913).

EXCAVATION. A term applied to the removal of material in building or engineering operations, to provide space which may be or

may not be filled with some sort of structural work. Excavation may vary from the simplest digging of a well or cellar for a rural dwelling to work involved in the construction of a ship-canal or railway terminal, tunnel subway, or subaqueous foundation. It may involve the use of pick and shovel or other hand tools, a horse-drawn plow or scraper, a steam shovel, or other forms of excavating machinery (q.v.) with or without the use of high explosives (see **BLASTING**), or various complicated dredging machinery. (See **DREDGE**.) Often it is a form of engineering where the element of human labor figures more prominently than elsewhere, as much of the work is done by hand, although this condition has been improved by recent forms of excavating machinery. The term *Excavation*, however, is so general a one that reference should be made to articles describing more important processes included under such titles as **CANALS**, **DAMS AND RESERVOIRS**, **EXCAVATING MACHINERY**, **FOUNDATIONS**, **TUNNELS**, **DREDGE**, **RAILWAYS**, ETC.

EXCELSIOR (Lat., higher). 1. The motto of the State of New York. 2. A widely known poem of Longfellow (1841), suggested by the motto of New York, and beginning "The shades of night were falling fast."

EXCELSIOR. A material formed of thin wood shavings, much used for packing purposes, stuffing for mattresses and upholstery, as stable and kennel bedding, and in France employed as a substitute for absorbent lint in hospitals, for filtration purposes, and for weaving into floor coverings. It was first made in the United States about the middle of the nineteenth century, being put on the market in 1860, but later the manufacture was extensively taken up in Europe, especially in France. Excelsior is not, as is often supposed, made from shavings, but directly from logs of wood. Aspen or poplar and basswood furnish the best material. The logs are first sawed into blocks, 19 inches long, 5 inches thick, and the width of the log. These bolts, or split billets, are seasoned, split in two 19-inch lengths, and the ends trimmed down to make the final bolt for the machinery 18 inches long, the usual length of a strip of excelsior. A knife shaves off the surface of the bolt, the slice first having been split by a series of scoring knives. The tiny fibres curl and commingle as they fall from the knife; the finer the shavings, the higher the grade of the product. An excelsior machine will make from 200 to 300 strokes a minute, each stroke cutting off a tier of fibres from the face of the block. Excelsior is packed in bales weighing 250 pounds. The annual production for the United States, amounting to some 140,000 tons, requires some 85,000,000 feet of timber, or the growth of over 14,000 acres of forest land. The American product in 1911 was manufactured by 122 factories, which consumed 142,944 cords of wood, of which 61,941 cords were cottonwood, 37,901 cords yellow pine, and 33,042 basswood. The price in 1914 varied from \$8 to \$22 per ton on the market according to the grade. It was said that it costs from \$7 to \$12 per ton to manufacture and market the product.

EXCELSIOR SPRINGS. A city in Clay Co., Mo., 28 miles northeast of Kansas City, on the Chicago, Milwaukee, and St. Paul, the Wabash, and the Kansas City, Clay County, and St. Joseph railroads (Map: Missouri, B 2). Its many mineral springs with medicinal properties

have made the city a popular health resort. There are several fine hotels and pavilions, a large auditorium, Carnegie library, and a government building. The city has also an ice factory and bottling works. Pop., 1900, 1881; 1910, 3900.

EXCEPTION (Lat. *exceptio*, from *excipere*, to except, from *ex*, out + *capere*, to take). In law: (a) a taking out or excluding something from the operation or effect of an instrument, statement, or the like; (b) an objection legally taken to testimony or other material matter in a legal proceeding; (c) the clause, writing, or statement by which either of these objects is accomplished, also the thing excepted or excepted to. When applied to a clause in a deed, it means a provision that exempts something from the grant, as where the deed conveys a certain farm with the exception of a described piece of land or a designated building or tree. (Cf. **RESERVATION**.) An exception in a statute exempts a person or thing from the operation of the enactment; and it is a rule of pleading in a criminal prosecution or in a civil suit for penalties under such a statute, that the indictment or complaint must negative the exception, i.e., deny that the defendant or the alleged criminal act comes within the exception. In admiralty and equity practice the term is applied to the proper method of bringing before the court an objection to the regularity or sufficiency of a pleading or proceeding. In this sense an exception partakes of the nature of a pleading, performing the function of a special demurrer at common law.

The term is employed most frequently, however, in common-law actions to describe the formal signification of a party's objection to an adverse ruling of the court upon some point of law. It must be taken at the time of the ruling, or within a prescribed period thereafter, and should be entered upon the court's record, so that a proper bill of exceptions (q.v.) may be prepared for a review of the case by an appellate court. Consult the authorities referred to under **REAL PROPERTY**; **PLEADING**; **PRACTICE**.

EXCESS (Lat. *excessus*, departure, from *excedere*, to depart, from *ex*, out + *cedere*, to go). The remainder arising from dividing one number by another is often called the excess, as in casting out nines in the test for divisibility. (See **CHECKING**.) In spherical trigonometry the excess of the sum of the angles of a spherical polygon over $n - 2$ straight angles (the sum of the angles of a plane polygon of the same number of sides) is called the spherical excess of the polygon; e.g., the spherical excess of a spherical triangle with the angles 90° , 127° , 40° , is 77° . When the area of a spherical triangle, compared with the area of the sphere on which it lies, is very small, it may be taken as the area of the plane triangle with sides of the same length as those of the spherical triangle and with angles diminished by one-third of the spherical excess. If S denotes the area of the spherical triangle, E its excess, and r the radius of the sphere, then
$$E = \frac{S}{r^2 \sin 1''}.$$
 This formula is of use in triangulation (see **SURVEYING**) to check the excess as found from the observed angles.

EXCHANGE (OF. *echanger*, *echanger*, Fr. *échanger*, It. *scambiare*, ML. *excambiare*, to exchange, from Lat. *ex*, out + ML. *cambiare*, Lat. *cambiare*, to change, from OIr. *cimb*, tribute; connected with Gall. *cambos*, Ir. *camm*, Welsh,

Corn., Brit. *can.*, crooked). In the older political economy, a division of the science including the treatment of value, price, money, credit, and also such topics as trade, domestic and foreign, transportation by land or sea, commercial policy, regulation of banking, and the like. In the recent development of economic science most of the topics mentioned above have been assimilated to production and distribution, and exchange, as a division of the science, has fallen into disuse. See **POLITICAL ECONOMY**.

EXCHANGE. The conversion of the money of one country into its equivalent in the money of another. The technical meaning of the word has now, however, come to be the difference between the actual value of money taken by the standard of bullion, in any two places, with relation to each other. If in New York it requires more than \$500 to pay a debt of that amount in London, the rate of exchange is against the former town and in favor of the latter, an inhabitant of which can pay a debt of \$500 in New York with less than that amount of bullion in London.

The operations of exchange are based on the principle of the cancellation of indebtedness and can be best explained by simple example. If a New York merchant, A, buys goods from a London merchant, B, it would seem that the simplest way of discharging his indebtedness would be by the shipment of gold to London. But this primitive method is not the simplest. Such a shipment involves costs of transportation and insurance, which materially enhance the price paid. A simpler plan would be to have another London merchant, C, who owes money in New York, make the payment in London to A's creditor, while A in New York makes the payment to C's creditor at that point. This is in effect what actually takes place in the settlement of such debts, though neither A in New York nor C in London is under the necessity of ascertaining to whom payment must be made to cancel the two debts. This is done through the agency of the banks and bankers. A in New York goes to his banker and buys a draft upon London; C in his turn buys a draft upon New York. These two drafts cancel one another, and London pays New York, and New York London, without the shipment of specie.

In order to correspond to the facts of the actual world, these simple transactions must be multiplied by the thousandfold. The aggregate of the payments to be made by New York to London must be balanced off against those of London to New York. But can it be supposed that the balance is ever exact? As between two points only, this is probably never the case. How, then, can a balance be reached? In the first place, by associating with New York other places which do their banking through that centre. In this manner practical equality of demand between points is attained, and exchange is at par. Costs of shipment are eliminated, and to pay a debt of £500 in London, the New York merchant pays the exact equivalent in American money of the fine gold contained in £500. But such equality of demand is rare. There is usually an excess of payments to be made by one point or the other. In such cases exchange rises above or falls below par. If New York has more payments to make upon London than London on New York, sterling exchange will be in demand. To secure the means of payment in London the New York merchant

will pay more than the par, and exchange is at a premium. If the contrary case prevails, New York bankers in their desire to secure payments for London will offer them at less than par. The alternative of buying exchange is always the shipment of bullion, and when the premium upon exchange grows as large as the cost of shipping bullion, gold exports will begin. The cost of shipping bullion fixes, therefore, the maximum of exchange. In the last resort, therefore, the discrepancy in the relative demand of two points is liquidated by shipments of specie, but it is to be observed that it is only the balance which is shipped, and large amounts are settled by the principle of compensation. Before the shipment of specie takes place, various adjustments in trade are likely to occur that reduce the amount of specie to be shipped. When exchange on London is above par, the premium acts as a stimulus to exportation; when below par, a stimulus to importation is offered. Especially significant is the effect of changes in the rate of exchange upon the movement of securities, which often is sufficiently great to liquidate balances. In the general circle of transactions of this kind the state or town which has the largest amount of transactions will have the largest number of debtors and of creditors and will afford the chief facility for each compensating the other. It is thus that London is the centre of the money market, where all the debits and credits of the world may be said to meet and extinguish each other. While the old notions about the balance of trade (q.v.) existed, it was supposed that the nation which the exchange was against was going to ruin, while that which it was in favor of was prospering through the other's loss. At present it is inconvenient and expensive to a country to have the exchange against it. An adverse exchange generally indicates a sort of break in the circle of trade which it would be advantageous to fill up, and may be caused by the commerce of a country decreasing; on the other hand, however, the imports for which a country pays in cash or in expensive bills may be a highly advantageous traffic. Gold-producing countries find bullion their most advantageous export, and the same is the case with countries into which gold has flowed in excess.

Some confusion as to rates of exchange often occurs because of the failure to note the divergent practice of the London and other markets. In London they reckon how much foreign money can be purchased by a definite sum of the home currency. Thus, the par of exchange between London and New York being £1 = \$4.866½, London may reckon exchange at \$4.84, in which case American money is dear and exchange at a premium. On the other hand, New York reckons the cost in American money of a definite quantity of foreign money. Thus, when sterling exchange is quoted at \$4.84, English money is cheap and exchange below par. Consequently, in England, exchange "falls" as the conditions become more unfavorable, while in the United States exchange "rises" when the conditions become unfavorable. A failure to note this difference has been a fruitful cause of misunderstanding. Consult: G. J. Goschen, *Theory of Foreign Exchange* (10th ed., London, 1894); C. A. Stern, *Arbitrations and Parties of Foreign Exchange* (New York, 1901); F. Escher, *Elements of Foreign Exchange* (ib., 1910); D. M. Barbour, *Standard of Value* (ib., 1912); A. W. Margraff,

International Exchange (4th ed., ib., 1912); H. Withers, *Money-Changing* (ib., 1913).

EXCHANGE. A term applied to an organization of merchants meeting at stated times, generally daily, for the transaction of business, as well as to the building in which such meetings occur. Here and in Great Britain a sharp line is generally drawn between stock exchanges, at present the most important form of exchanges, and those devoted to other classes of transactions, but on the continent of Europe this is not the case. There the exchange focuses the commercial life of the community at one point, and accordingly the buildings devoted to the purpose are frequently among the architectural ornaments of the city, as in Paris and Brussels. Whether there is a single exchange or several, the kindred purposes of all such organizations have developed a particular type of building. There is generally a large quadrangular space surrounded by an arcade, frequently with offices opening from the latter. The central space, the "floor," devoid of furniture—transactions of large amount being carried in the head or on the simplest memoranda—is reserved for the accredited members of the organization, while the arcade, or gallery, as the case may be, accommodates visitors. Offices for the manager and his assistants, and frequently reading and recreation rooms for the members, form a part of the equipment of such a building.

Exchanges as organizations are of quite early date, and we have no precise record of their original purposes. It is probable that they grew out of the mediæval guilds of merchants. The latter erected their own warehouses, and in the regulation of their use and the determination of trading customs and settlement of disputes in such guilds we see types of the activities of the modern exchanges. Many of the latter were founded early in the sixteenth century, especially in the Netherlands. The Royal Exchange of London dates from 1556, when it was established by Sir Thomas Gresham. Wherever they exist exchanges are primarily organizations of merchants with more or less recognition and control by the government. In England and the United States they are simply private corporations chartered by the State, but on the continent of Europe the government takes an active part in their establishment and administration.

The main characteristic of dealings in exchanges is the fact that the goods dealt in are not physically present. There is not, as in the case of sales in a private establishment, opportunity for inspection of goods. It follows, therefore, that exchanges deal in standard goods only, or rather in such as may be definitely described. The purchaser of goods on an exchange does not buy specific goods, but rather a specific quantity of goods of a definite character. It is this feature which adapts the exchanges in so marked a degree to speculation. Persons buy and sell without contemplation of future delivery, but with reference to a future price. Settlements are expected and made, not by delivery of the goods, but by adjustment of the difference between the contract price and the price ruling in the market at the maturity of the contract.

Stocks, bonds, cotton, wool, grain, hides, provisions, and a few other commodities can be bought and sold in this fashion. Of these, the first and second are particularly adapted to such transactions, and stock exchanges are ac-

cordingly the most widely disseminated form of exchanges. In the United States separate exchanges generally exist for them, while the other commodities may be handled by a general produce exchange, or by separate organizations, depending upon certain historical antecedents or upon the importance of the staple in question for the trade of a particular place.

Stock exchanges and produce exchanges have many points of organization and procedure in common, but as stock exchanges are treated in a separate article, we shall confine our explanations here to produce exchanges, illustrating their methods and purposes by some account of the New York Produce Exchange.

This organization was originally chartered April 19, 1862, as the New York Commercial Association. Its purposes are declared by its charter to be "to provide and regulate a suitable room or rooms for a Produce Exchange in the city of New York, to inculcate just and equitable principles in trade, to establish and maintain uniformity in commercial usages, to acquire, preserve, and disseminate valuable business information, and to adjust controversies and misunderstandings between persons engaged in business." In 1868 an Act amendatory to the charter changed the name to the New York Produce Exchange, while a further Act of 1892 added to the declared purposes, "to make provision for the widows and families of deceased members." The conduct of the affairs of the organization is vested in a board of managers consisting of the president, vice president, treasurer, and 12 other managers elected annually by the association. The charter authorizes the board of managers to elect annually an arbitration committee composed of five persons not members of the board, whose duty it is to hear and decide controversies between members. On filing the award of the committee in the Supreme Court of the County and City of New York, judgment is entered according to the award. From such award there is no appeal except for frauds, collusion, or corruption of the arbitration committee or of its members. Other committees are named by the president. Of these, one of the most important is the complaint committee, which takes cognizance of all duly entered complaints against members. This body endeavors to conciliate the disputants or induce them to resort to arbitration. Failing in this, it may, if circumstances warrant, bring the matter before the board of managers, which may, when the charges against the defendant are substantiated, by vote of two-thirds of the members present, censure, suspend, or expel him from the exchange. Other important committees are that on trade, which has to do with commercial usages, and the committee on information and statistics. In addition to the managers and various committees there is a superintendent of the exchange charged with the details of management, the care of the building, and similar duties. Annual assessments of not less than \$10 or more than \$30, as the board may direct, form the basis of the revenues of the exchange.

In addition to general rules as to membership and the like, there is a series of special rules for the trade in provisions, lard, grain, flour, seeds, petroleum, oil, butter, cheese, and hops, maritime trade, and steamship trade. These rules have much similarity, though they differ according to the nature of the business in question. Each set of rules defines standard grades

in the commodity to which it refers. Thus, in the rules governing the provision trade we find exact descriptions of what is meant by such familiar market terms as mess pork, prime mess pork, extra prime pork, and the like. The rules define also the quantities in which such goods shall be handled, and modes of packing and curing. They provide a system of inspection, and the board licenses inspectors to carry it out. Standard forms of contract, rules as to settlements, and similar matters are features of the rules. Far more complex are the rules governing the grain trade, but they do not differ in spirit.

Each exchange makes its own rules, such as are adapted to the locality in which it is situated, but for the same kinds of trade the rules have much in common. This is particularly true of all rules fixing definitions, as the various exchanges strive here especially to secure uniformity. An important function of all exchanges is the dissemination of information. Not only are the market reports published daily in the papers prepared under the supervision of the exchanges, but annual reports embracing a vast amount of statistical information are frequently published. See STOCK EXCHANGE; SPECULATION.

EXCHEQUER, CHANCELLOR OF THE (OF. *escheker*, Fr. *échiquier*, checkerboard, alluding to the checkered cloth on which accounts were reckoned, from OF. *eschees*, Fr. *écheq*, chess, from Pers. *šāh*, OPers. *šāyabāyā*, Skt. *ksatriya*, king, from *kṣi*, to rule). In Great Britain, the head of the Treasury Department. He must be a member of the Lower House, which holds control of the purse. When the Prime Minister is a member of the House of Commons, he sometimes holds the office of Chancellor of the Exchequer. The judicial functions of the Chancellor, which before the eighteenth century were of great importance, have disappeared. See EXCHEQUER, COURT OF.

EXCHEQUER, COURT OF. An English law court of great antiquity and importance, originally instituted for the adjudication of controverted questions relating to the royal revenues. It is said to have existed from the early times of the Conquest and is supposed to have been denominated the Exchequer from the fact that a checkered cloth was wont to be laid upon the table of the court. Under the Norman kings it was a branch of the *Aula Regia*, or Great Council of the Nation. From the reign of Henry III its existence as a separate court was recognized. Its special business continued to be the decision of revenue cases, but from an early period the court showed a tendency to extend its jurisdiction over the ordinary litigious business—the common pleas—of the country. This was done by establishing the fiction that all lieges were the crown's debtors, whereby the Court of Exchequer acquired a concurrent jurisdiction with the other courts of common law. Besides its common-law jurisdiction the Exchequer was distinguished from the two other superior courts of common law—the King's Bench and the Court of Common Pleas—by having an equity side; but this was abolished in 1841, and its equitable jurisdiction transferred to the Court of Chancery. The judges of the Exchequer consisted originally of the Lord Treasurer, the Chancellor of the Exchequer, and three puisne judges (these last being called barons of the Exchequer). The Chancellor of the Exchequer sat only on the equity side of the

court; he has not been called upon to exercise his judicial functions since 1735. The Court of Exchequer was abolished as a separate court by the Judicature Act of 1873, and its jurisdiction transferred to the newly created High Court of Justice. See BARON; CURIA REGIS.

The Court of Exchequer Chamber was formerly a court of all the judges in England assembled for decision of matters of law. Originally established in the reign of Edward III, for the purpose of reviewing the decisions of the common-law side of the Court of Exchequer, it developed into a general court of error, in which capacity it revised the judgments of the other two courts of common law as well. In the reign of Elizabeth it was enacted that the judges of the Common Pleas and Exchequer should form a second Court of Exchequer Chamber, for review of certain cases in the Queen's Bench. But this intermediate court of appeal was abolished by the Judicature Act of 1873.

In Scotland, before the Union, the *Exchequer* was the King's revenue court. A new court was established in the reign of Queen Anne having a private jurisdiction as to questions relating to revenues and customs of excise, and as to all honors and estates, real and personal, and forfeitures and penalties arising to the crown within Scotland. The judges of the court were the High Treasurer of Great Britain, the Chief Baron and four other barons, and English barristers as well as Scottish advocates were allowed to practice in the court. By a statute of William IV it was provided that successors should not be appointed to such of the barons as should retire or die, and that the duties of the court should be discharged by a judge of the Court of Session. More recently, by 19 and 20 Vict., c. 56, the Court of Exchequer has been abolished and its jurisdiction transferred to the Court of Session.

The Court of Exchequer Chamber in Ireland was established by 40 George III, c. 39, but was abolished as an intermediate court of appeal between the Irish courts and the High Court of England. (See COURT.) Consult Madox, *History and Antiquities of the Exchequer of the Kings of England*, etc. (2d ed., London, 1769); Poole, *The Exchequer in the Twelfth Century* (ib., 1912).

EXCHEQUER BILLS. Notes issued by the English Treasury or Exchequer for the purpose of supplying a temporary demand for money. Such bills were issued to meet temporary emergencies, with the expectation of repayment in a comparatively brief period. They bore interest and were payable at the option of the government. At times they have been liquidated by payment from current revenues; at other times by conversion into funded debt. While the bills have some of the features of investments, they are, on the other hand, receivable at the public Treasury in payment of taxes, and the rate of interest upon them has been variable, according to the condition of the market at the time of issue. They were first introduced into England in the reign of William III and have since been a conspicuous feature in English financial policy. Of late years, however, they have been generally superseded by the issue of Exchequer bonds. These differ from the bills in having a definite time to run, but otherwise they serve the same purpose. While the United States has issued in the past quarter of a century no obligations in any way analogous to the Exchequer bills and

bonds, there are some striking points of resemblance between the latter and the Treasury notes which were a frequent device of American financing before the outbreak of the Civil War. See TREASURY NOTES.

EXCHEQUER TALLIES. Seasoned wands of ash, hazel, or willow, formerly used for checking accounts in the English Exchequer. The sum acknowledged was inscribed on the tally, on the other side of which the same sum was inscribed in Roman characters, together with the payer's name. Notches marked upon the tally indicated by their form the class to which the account belonged. This tally was split, and the payer received one-half, which he presented for payment, and which was matched with the half remaining in the office.

EXCIPIENT (from Lat. *excipere*, to take out, from *ex*, out + *capere*, to take). An inert or slightly active substance, introduced into a medical prescription as a *vehicle* or medium of administration for the strictly medicinal ingredients or to make up the necessary bulk. Thus, conserve of red roses, or bread crumbs, or licorice powder is used to make up pills; white sugar in medicinal powders; water, mucilage, white of egg, sirup, glycerin, and many other substances in fluid mixtures.

EXCISE, *ëx-siz'* (MDutch *aksits*, *aksys*, Ger. *Acisc*, excise, from OF. *assise*, taxes, from *assise*, session, from *asseir*, Fr. *asseoir*, to sit, from Lat. *assidere*, to sit, from *ad* + *sedere*, Gk. *ἕζεσθαι*, *hezesthai*, Skt. *sad*, to sit; confused by popular etymology with Lat. *excisus*, p.p. of *excidere*, to cut off). A term commonly applied to a tax on commodities, levied either upon production or upon sale. In American finance the term is occasionally applied to taxes of an entirely different nature, as, e.g., to the corporation tax of 1909. A tax on commodities bought and sold is a very obvious one, but it has generally appeared in the simple shape of a toll on goods brought to market, and the complicated arrangements for officially watching the process of a manufacture for the purpose of seeing that none of the dues of the revenues are evaded is of comparatively modern origin. Though a tax corresponding to the excise appears to have been occasionally levied in England in very early times, the name first appears in the act of the Long Parliament establishing an excise on liquors, in 1643, with the promise of repeal at the end of the war. But when the land tax was removed or greatly diminished, and revenue from that source was no longer sufficient, it was found impossible to dispense with this new method of supply to the Treasury. Though always unpopular, the excise in some form or other has ever continued to be a material element in the taxation of Great Britain.

In the United States the term "excise" is comparatively unfamiliar. The taxation which corresponds to the English excise is known as internal-revenue taxation. See INTERNAL-REVENUE SYSTEM.

An excise, when compared with other taxes, has its good and its bad features; it is a method of extracting money for national purposes by taxing expenditures on luxuries and is especially serviceable when fed from those luxuries the use of which in excess becomes a vice. On the other hand, it renders necessary a system of inquisitorial inspection, while the manufacturer is at times obliged to employ a more expensive and inconvenient process and to forego the in-

troduction of improvements in order to conform to governmental regulations, the cost of such unnecessary labor falling eventually upon the consumer. Moreover, checking the demand by artificially raising the price of a commodity in this way may often retard the growth of a rising industry. Though counteracted in a measure by the bonding system, the necessity of a larger capital for the manufacture of excisable articles fosters a sort of monopoly by its tendency to check competition; and since the manufacturer must realize profits on that part of his capital which is applied to the payment of taxes, as well as what is directly employed in the production of the article, the price to the consumer is greatly increased. These objections do not, however, invalidate the advantages of the excise system in this country, where the luxuries, spirits and tobacco, bear the chief burden of the tax; and it is the common opinion that a low excise on articles of luxury is the most productive as well as the least objectionable of taxes. See FINANCE: STAMP ACT; STAMPS; TAX.

EXCITANT (from Lat. *excitare*, to excite, from *ex*, out + *citere*, to call), or **STIMULANT** (from Lat. *stimulare*, to stimulate, from *stimulus*, goad). Any pharmaceutical preparation which, acting through the nervous system, tends to increase the action of the heart and other organs. Examples of cardiac excitants are strychnine, caffeine, and alcohol, in small doses. Among the respiratory stimulants ammonia is the most useful and powerful. Externally mustard and other rubefacients are employed. The class is a very numerous one, and must be used with discrimination.

EXCITO-MOTOR ACTION. See NERVOUS SYSTEM.

EXCLUDED MIDDLE, THE LAW OF THE. The logical principle that, of two contradictory propositions, both cannot be denied. One of the two must be affirmed. See OPPOSITION.

EXCLUSION BILL. See CHARLES II; JAMES II.

EXCOMMUNICATION. Exclusion from religious privileges; usually used of exclusion by formal sentence from the fellowship of the Christian Church. The ancient Romans had something analogous in the exclusion from the temples and from participation in the sacrifices of certain persons who were given over with awe-inspiring ceremonies to the furies. In the time of Christ it was a recognized penalty among the Jews (see John ix. 22; xii. 42; xvi. 2). A distinction is drawn in the Mishna between two degrees of excommunication; of these, the milder (*niddui*) involved exclusion from the life of the community for 30 days (or seven days), with the performance of penances and the wearing of mourning apparel. Twenty-four causes are enumerated, most of them of a civil nature. The heavier sentence (*cherem*) was pronounced with great formality of solemn curses and was for an indefinite time. A similar power was recognized from the first in the Christian Church (see Matt. xviii. 17; 1 Cor. v. 5; 1 Tim. i. 20) and is frequently referred to in the fathers. There were two forms of excommunication, medicinal and mortal—i.e., healing or reformatory and damnable. The two degrees of excommunication, major and minor, were early distinguished. Minor excommunication involved exclusion from the sacrament of the Lord's Supper and from the full privileges of the Church. Major excommunication was pronounced upon obstinate sinners,

relapsed offenders, and heretics. Its form was usually more solemn and the decree not so easily revoked. The term of the excommunication was left to the bishop. (See ABSOLUTION.) In Africa and Spain the absolution of lapsed persons—i.e., those who in times of persecution had yielded and fallen away from their Christian professions by actual sacrifice to idols—was forbidden except at the hour of death, unless by the special intercession of martyrs. At first no civil disabilities were connected with excommunication, but as governments became Christian, major excommunication was followed by loss of political rights and exclusion from public office. The capitularies of Pepin the Short, in the eighth century, ordained that major excommunication should be followed by banishment. Other national laws still further extended the scope of the ecclesiastical censure. By a logical consequence a sentence of excommunication directed against the ruler deprived him of his rights to govern and by that fact absolved his subjects from their allegiance to him. When such a purpose was intended, however, a special sentence to that effect was attached to the bull of excommunication. The reformers claimed the power of excommunication in the same degree as the church from which they seceded. Luther, as may be seen from the *Table Talk*, insisted on the right of excommunication as inherent in the ministers of the church. Calvin (see the *Institutes*, iv, xii) asserted that excommunication is of the very essence of the ministry. At first civil disabilities, as in Geneva, followed excommunication in reform communities. Later this ceased to be the practice. Nevertheless in England, until 1813, persons excommunicated were debarred from bringing or maintaining actions, from serving as jurymen, from appearing as witnesses in any cause, and from practicing as attorneys in any of the courts of the realm. All these disabilities were removed by statute (53 Geo. III, c. 127), and the excommunicate were declared no longer liable to any penalty, except "such imprisonment, not exceeding six months, as the court pronouncing or declaring such person excommunicate shall direct." By the laws of the United States excommunication cannot involve the loss of civil rights, and the civil courts cannot be used to enforce the restoration of church membership.

Anathema differs from excommunication only in that it includes certain formal ceremonies and requires a solemn reconciliation. There was some doubt on this point until the definition of the Council of Trent. In the Catholic church the power of excommunication belongs to those who possess ordinary or delegated jurisdiction in the external forum, but only in regard to those subject to them. Parish priests who have jurisdiction only in the *forum internum* cannot excommunicate, and the power can never be delegated to laymen. Bishops, within their sees; archbishops, while exercising visitatorial jurisdiction; heads of religious orders, within their own communities, all possess the power to issue excommunication. The subjects of excommunication can be only Christians, alive and of sound mind, guilty of a grave offense and persisting in it, and subjects of the judge giving sentence. The supposed excommunication of the dead was merely a declaration that the deceased had, while living, been guilty of some crime to which *excommunication is attached by the church laws*. The sentence of excommunication may be justly

inflicted on heretics or schismatics. Excommunication may be incurred without the necessity of formal sentence. For some acts a person may be excommunicated, but does not actually incur the sentence unless it is pronounced by a competent judge. For other faults, however, the words of the law are that upon a given act being done the doer of it falls at once under the ban of the church, the phrase usually employed being "Let him incur excommunication *ipso facto*." These are the excommunications *late sententia*, so called. Absolution from certain excommunications is reserved to the Pope. Those under major excommunication fall into two classes—the tolerated, whom the faithful are not bound to avoid, and the nontolerated—i.e., those excommunicated by name and publicly denounced—with whom the faithful are forbidden to hold either religious or civil communication. The latest papal deliverance on this subject is the Bull *Apostolica Sedes*, issued by Pius IX, Oct. 12, 1869. This permits civil intercourse, even with persons under major excommunication, for the sake of the faithful themselves, unless in very exceptional circumstances and with regard to specially designated persons. The formula of excommunication from the anonymous appendix to Marculphus cited in *Tristram Shandy*, and often quoted as the actual formula employed by Roman Catholic authorities, is a forgery and has never been employed. Consult: Von Kober, *Der Kirchenbann* (Tübingen, 1857); Schilling, *Der Kirchenbann nach canonischen Recht* (Leipzig, 1859); and Taunton, *The Law of the Church* (London, 1906). For a description of the formula used, see BELL, BOOK, AND CANDLE.

EXCRETION (Fr. *excrétion*, from Lat. *ex-cernere*, to separate, from *ex*, away + *cernere*, to separate). In animal and plant physiology, the process by which materials of no further use in nutrition are separated from the protoplasm and rejected by the body, and the substances so separated. This process is similar to that of secretion (q.v.). See FÆCES; URINE; SWEAT.

EXCRETORY SYSTEM, COMPARATIVE ANATOMY OF THE. The organs whose function it is to remove from the animal body both the waste products of metabolism and the excess of other substances that occur in the blood. Not only are the products resulting from the metabolism of proteids separated from the blood, but the blood is kept at its normal standard by the excreting organs. They remove both the qualitative and quantitative excess of any substance in the blood. The excretory organs may be likened to discriminating strainers. Of two substances equally soluble in the blood, such as sugar and urea, the urea is extruded by them and the sugar retained, while such insoluble substances as resin are removed by the vertebrate kidneys. The excretory organs of vertebrates are primarily the kidneys. The skin and lungs likewise function to some extent as eliminating organs. The lungs, however, are both organs of nutrition and excretion, for while they take in oxygen, so necessary for the animal welfare, they throw out carbonic-acid gas, which is a poison to the animal body, and free the body from other excrementitious substances. The whole surface of the skin functions to some extent as an excreting organ, for considerable water, salts, and fats are expelled by the skin. The waste products produced by the breaking down of nitrogenous substances, and which contain nitrogen, such as uric acid and urea, are separated from the blood

and discharged from the body by another set of organs, known as the renal organs or kidneys. These organs vary greatly in form and function throughout the animal kingdom.

Protozoa. The simplest excretory organ is the contractile vacuole found in the Protozoa, but little is known concerning its function. In certain Infusoria fine lines or spaces radiate out from the central part of the vacuole into the substance of the organism, and through them the waste substances are drained into the vacuole. The contents of the vacuole either burst to the exterior or are cast out forcibly through the body wall by the contraction of the walls of the vacuole.

Flatworms. Organs that have an undoubted excretory function are first met with in the flatworms (Platyhelminthes). They are known as the water-vascular system. This system consists, in *Planaria*, of two lateral coiled trunks, one on the right and one on the left side of the body, from which many side branches ramify through the tissues of the body. These tubes open on the dorsal surface of the body by means of several minute pores. The fine lateral branches subdivide so as to give rise to still finer capillary vessels. Each of these latter may terminate in a flame cell. The flame cell is nucleated and contains a vacuole or space in communication with a capillary. The vacuole contains one or more vibratile cilia, whose flickering motion, like that of a candle flame, has given rise to the term "flame cell." A respiratory function has also been maintained for this system. The excretory system of the liver fluke consists of one main trunk, which terminates anteriorly in four large branching trunks. The latter eventually lead into flame cells. Posteriorly the main trunk ends in an excretory pore. In the tapeworm there are four longitudinal water tubes, which extend throughout the entire length of the worm. At the posterior end of each proglottis they are connected by a transverse tube. At the posterior end there is a pulsating caudal vesicle which opens to the exterior. As in the planarian, so in the tapeworm the main trunk gives rise to dendritic branches which end in flame cells. The lateral tubes of nematodes and rotifers end in a common duct or a contractile vessel, respectively, posteriorly, and in flame cells at the other end.

Echinodermata. It is maintained by some authorities that the water-vascular system of Echinodermata helps to get rid of waste products. (See ECHINODERMATA.) The real function of this system is little understood. It probably subserves more than one function.

Brachiopoda. In the brachiopods there is a pair of nephridia lateral to the intestine. Each is funnel-shaped and opens into the body cavity by means of a plaited nephrostome and outwardly into the mantle cavity by means of a narrow curved portion.

Annulata. The organs that are considered to be excretory in the segmented worms are known as the segmental organs, or nephridia. They consist of a pair of tubes which are repeated in most of the annelids in nearly every segment of the body. There is only one such pair of tubules in *Sipunculus*, and in some other worms they are not found in a few of the most anterior and posterior segments of the body. A nephridium consists of a long tube coiled in a complicated manner. Each tube ends anteriorly in a ciliated funnel. The funnel connects with the coelom, or

body cavity, of the segment just anterior to the one in which its coiled tubule lies and in which the tubule communicates with the exterior by a ventral, contractile opening. In the earthworm a part of the lumen of the tubule is intracellular, like the flame cells of *Scolecida*; i.e., it is formed by the perforation of a strand of cells. The thicker portion of the tubule is lined with cells, hence this portion of the lumen is intercellular.

Crustacea. The excretory system of Crustacea shows little relationship either with that of annulates or with insects. In larval Crustacea two sorts of so-called excretory organs are present. One pair of these organs lies at the base of the antennae and is known as the antennary glands—the "green gland" of the crayfish. The other pair comprises the so-called "shell glands" which open at the base of the second maxillae. In the course of the development of the Crustacea one pair atrophies. The Entomostraca retain the shell gland, and the Malacostraca the antennary gland. In the Stomatopoda, of which *Squilla* is an example, the renal excretion is poured through a pair of glandular tubes into the rectum. In the amphipods the excretory function is assigned to the coeca at the posterior end of the mesenteron. The shell gland of some of the Cirripedia is said to open like a true nephridium into the body cavity.

Peripatus possesses paired nephridia much like those of annulates. They open at the basal and lower surface of the legs. The fringed funnel of each nephridium opens either into the body cavity or into a closed sac. The development of the salivary glands, anal glands, and reproductive ducts shows that they are modified nephridia.

Hexapoda. The excretory system of insects is well developed, but bears no relation to that of annulates. There are no nephridia, but in connection with the proctodæum (hind-gut) there are from two (some Lepidoptera) to 150 (bee) fine tubes or solid threads, the Malpighian tubes, which twine about in the abdominal cavity. To these organs has been ascribed the excretory function, since uric acid is contained within them. In the Orthoptera these tubules may be united with a common duct.

Mollusca. A pair of kidneys or excretory organs are always present in the Mollusca. In many forms they are symmetrically arranged, one in each half of the body. These organs communicate with the body cavity by means of a wide opening (frequently a ciliated funnel), and with the exterior by means of a small opening. In these respects they correspond with the annelidan segmental organs, and probably they are homologous with a pair of such organs. These mesonephridia are situated just below the pericardium, with which the kidney portion of the organ also communicates. Besides the glandular kidney part there is usually a ciliated bladder portion. The cilia create an outward-flowing current. The molluscan kidney is known as the organ of Bojanus, in honor of its discoverer. In addition there is a gland known as Weber's organ, which lies in front of the pericardium. It discharges its secretion into the pericardium and is considered to have an excretory function. The nephridia of gastropods open directly to the exterior or by a ureter near the anus. The right organ is the larger, or in some cases is the only one to be developed. In the pearly nautilus there are four renal organs. In the squid and nautilus the glandular portion of

the kidney follows along the right and left branchial veins.

Chordata. *Balanglossus* has a very slightly developed excretory system. Two ciliated funnels pass to the exterior in the region of the collar, but no nephridia are known. The proboscis gland has been thought possibly to have an excretory function, but apparently it does not open to the exterior. In tunicates the excretory function has been ascribed to a mass of clear vesicles in the loop of the intestine. In them uric acid is present. The so-called subneural gland may possibly also have secretory function. In *Amphioxus* Boveri has discovered about 90 pairs of nephridia. They are short tubes and open into the atrial cavity by a single opening for each tubule. The other end is in communication with the body cavity by means of a variable number of funnels. Ray Lankester, Hatcher, and others have described other tubules in different regions of the adult or larva whose function is in doubt. Likewise on the floor of the atrial chamber there are groups of cells which have been called renal papillae.

Craniata. The urinary system of vertebrates is so intimately connected with the reproductive system that the two systems are frequently considered together under the title *urinogenital system* or *organs*.

The excretory organs of vertebrates are much more complicated than any we have so far considered. In its most highly developed form the vertebrate excretory system consists of three sets of organs. The first set to arise, both in phylogenetic and ontogenetic development, are known as the *pronephros*, or "head kidneys." Usually they arise in a more anterior position than the other kidneys. In position as well as in several other respects they correspond to the segmental tubules of amphioxus. They are segmentally arranged like those of amphioxus and annulates, but they are much fewer in numbers. They arise in the mesoderm of the anterior end of the coelomic wall, and each tubule opens into the coelom by a ciliated funnel. They differ from the tubules of annulates and amphioxus, however, in that each tubule does not open directly to the exterior, but pours its secretion into a common duct—the *segmental duct*—which in turn discharges into the cloaca. It has been suggested that the segmental tubules formerly poured their contents into a longitudinal groove situated on the exterior. By the sinking of the groove beneath the surface a tube was formed. The embryonic development of this duct gives little light as to its origin. In some cases it is formed by a growth backward from the pronephros. In others the mesoblast or even the hypoblast seems to take an active part in its formation. The head kidney is said to be the functional excretory organ in the fish *Teirasfer* and some of the other bony fishes. In *Myxine* and *Bdellostomia* it persists throughout adult life, although evidently in a somewhat degenerate condition; while in all the higher vertebrates except turtles and crocodiles it is rudimentary even in embryonic life.

The head kidney then is present at some stage in the development of all vertebrates, although its appearance may be very fleeting in some forms, and it may be so rudimentary in others as never to be functional. When the head kidney is functional, the *mesonephros*, or "middle kidney," appears later in larval development than in the cases in which the pronephros is only

rudimentarily developed. The mesonephros consists of another series of tubules, developed from the mesoblast and usually in a position posterior to that of the head kidneys. These tubules likewise become connected with the segmental duct. Below the *Amniota* this, the Wolffian body, is the permanent kidney. Upon the appearance of the mesonephros the nephridia of the head kidneys lose their connection with the segmental duct. The tubules of the mesonephros also open into the body cavity by ciliated funnels. The funnels are not always present. They are in intimate relation with a glomerulus from the aorta. In selachians Paul Meyer and Rückert have observed vessels which connect the dorsal aorta with the subintestinal veins. Such a blood supply corresponds more nearly with that afforded by the segmental organs of the amphioxus.

In many forms the segmental duct seems to divide, or at least two ducts appear side by side. One retains its connections with the kidney tubules and is known as the Wolffian duct. The other, the Müllerian duct, opens into the body cavity on the one hand and as the oviduct serves to convey the eggs to the exterior. In the male the Wolffian duct becomes the genital duct. In the higher vertebrates still a third or permanent kidney arises posterior to the mesonephros and is known as the metanephros. This is the "kidney" of the higher vertebrates. The permanent kidney consists of coiled tubules, but a nephrostome is never present. Capillaries, forming glomeruli, are also present. The duct, the ureter of the permanent kidneys of higher vertebrates (from reptiles to man), is formed from a diverticulum which grows forward from the posterior end of the Wolffian duct and connects with the posterior nephridia.

The urinary bladder of fishes is formed by a diverticulum of the ureter, while in higher vertebrates it arises from the basal portion of the allantois.

EXCUBSION, THE. A didactic and descriptive poem in blank verse, by Wordsworth, originally intended as a part of *The Recluse*, never completed. It appeared in 1814.

EXE, Éks. A river rising in Exmoor, in West Somersetshire, England (Map: England, C 6), only 4 miles from the Bristol Channel. It flows 19 miles southeast to the borders of Devonshire, and then 35 miles south through that county, past Tiverton and Exeter, into the English Channel at Exmouth.

EXECUTION (Lat. *executio*, performance, from *exequi*, *exsequi*, to carry out, from *ex*, out + *sequi*, to follow; connected with Gk. *ἐξετάω*, *hepesisthai*, Lith. *sekti*, Skt. *sac*, Av. *hac*, to follow, Goth. *salkwan*, Icel. *sja*, OHG. *selan*, Ger. *schen*, AS. *sēon*, Eng. *see*). The enforcement, by the duly constituted authorities, of a final judgment, order, or decree of a court of justice. In strictness, the term has reference only to the enforcement of the process of the common-law courts, whether in civil or in criminal cases, and is not applicable to the procedure for carrying

into effect the decrees of the equity courts. This is due to the radical difference in the jurisdiction exercised by the two classes of tribunals. A judgment in a court of law is merely an adjudication of the rights of the contending parties, declaring that one is or is not entitled to specific property or to a sum of money. In itself considered it has no further force and is ineffectual until enforced by distinct process, and this is furnished by the writ of execution, addressed to the administrative officers of the county, and by the proceedings taken thereunder. A court of equity, on the other hand, acts in personam; i.e., its decree is directed to the person against whom the proceeding is brought and binds him directly without further process. The machinery of the court is sufficient to enforce its decrees without calling upon the administrative officers of the county or the state to carry them into effect. However, in those cases in which the decree in equity directs the delivery of specific property or the payment of a sum of money, the process of execution is coming to be employed for carrying it into effect.

Execution on civil process is generally accomplished by the seizure of the judgment debtor's property or person. In England the subject is now regulated almost entirely by the rules of the Supreme Court. These declare that the term "writ of execution" shall include the common-law writs of *fiat facias*, *capias*, *elegit*, sequestration, and attachment (qq.v.); and they provide for the form as well as for the manner of issuing and enforcing each of these writs.

In this country the form of executions and the method of issuing and enforcing them are quite various. The statutes and court rules of each State must be consulted for the procedure therein, and the Federal statutes and court rules for the procedure in Federal jurisdictions. In general terms it may be said that, a final judgment having been rendered, the attorney for the judgment creditor is authorized to issue a writ of execution to the sheriff, marshal, or similar administrative officer, commanding him to seize and sell property of the judgment debtor sufficient to pay the judgment with interest as well as the officer's fees and expenses. In certain cases, usually those where the judgment debtor has been guilty of some fraud or violence or other misconduct, an execution may be issued against his body, commanding the officer to seize and imprison him until the judgment is paid. This is commonly known as a "body execution." Certain property of the judgment debtor is exempted by statute from execution. This includes, as a rule, a small amount of household furniture, of food and fuel for his family, of wearing apparel, of books, tools, and implements of trade, and the like. Here, again, the statutes applicable to a particular case must be consulted. Consult Edwards, *Law of Executions* (London, 1888), and Freeman, *Treatise on the Law of Executions in Civil Cases* (3d ed., San Francisco, 1900). See DEBTOR.

Execution in criminal cases is the enforcement of a sentence or judgment duly pronounced by a court. If the judgment is for other than capital punishment (q.v.), a certified copy of its entry upon the minutes of the court is generally required to be furnished to the officer whose duty it is to enforce it, and no other warrant or evidence of authority is necessary to justify its execution. If the criminal is sentenced to the punishment of death, a warrant, signed by

the judge presiding at the trial, is ordinarily delivered to the sheriff or similar officer, appointing the time and describing the manner of the execution. Formerly criminal sentences were executed publicly and often were revolting exhibitions of cruelty. The modern tendency throughout Christendom has been to abolish the publicity and to minimize the cruelty of criminal executions. Consult the authorities referred to under the titles CRIMINAL LAW; SHERIFF; CAPITAL PUNISHMENT; ETC. See PUNISHMENT; CAPITAL PUNISHMENT; DROWNING; ELECTROCUTION; GUILLOTINE; HANGING; MAIDEN; MURDER; NEWGATE; PARRICIDE; PEINE FORTE ET DURE; TREASON; TYBURN; WHEEL, BREAKING ON THE, ETC.

EXECUTION, MILITARY. In a legal sense, the carrying into effect the sentence of a military court, as the "execution of the sentence." (See MILITARY LAW.) In the manual of drill regulations, commands are of two kinds—preparatory commands and commands of execution. The latter causes the execution of the former. In the command "1. Forward; 2. March," the word "march" is the command of execution.

EXECUTIONER. The official who inflicts capital punishment. In early times, both among the Romans and the Teutonic peoples, a distinction was made between two aspects of the function. In Rome the lictors executed sentences passed on citizens, while an official called *carner*, whose office was considered degrading, crucified or tortured slaves and foreigners. In primitive Germany the carrying out of the sentence usually fell either to the community from which it proceeded or to the accuser and his friends—a custom which in some places prevailed as late as the sixteenth century, although the counts of the Frankish monarchy had their official jailers and hangmen. Sometimes the youngest bailiff, or the youngest married man, was bound to carry out the sentence; in other cases one of the criminals was allowed to purchase his freedom by acting as executioner. In the towns sentence of death was usually executed by a subordinate official. In times of more definite organization another distinction was made between the *Scharfrichter*, who beheaded the victim without the necessity of personal contact, and the *Henker*, usually his subordinate, who carried out sentences of hanging, burning, quartering, and torture. The office of the former was expressly declared by law to imply no degradation, but popular feeling turned with disgust from it and required its bearer to occupy a designated place in church and to present himself last of all for communion.

Like many other offices, that of executioner seems to have been at one time hereditary in England, as in several German states, certain families being thus, as it were, condemned to perpetual infamy. In some parts of England the office was annexed to other posts; thus, the porter of the city of Canterbury was executioner for the County of Kent in the time of Henry II and Henry III, for which he had an allowance of 20 shillings a year from the sheriff, who was reimbursed by the exchequer. The sum of 13 pence halfpenny was long popularly spoken of as "hangman's wages," such a sum, equivalent to a merk Scots, having been the fee for each performance.

From Gregory Brandon, the London executioner in the reign of James I, the name Gregory was employed as a familiar designation for the

profession in general. Brandon managed to procure from the Herald's College a coat armorial and became an esquire by virtue of his office. One of his successors, Dun, is referred to in Butler's *Ghost*, published in 1862:

"For you yourself to act 'Squire Dun,'
Such ignominy ne'er saw the sun."

He was succeeded by John or Jack Ketch, commemorated by Dryden (*Epilogue to the Duke of Guise*), and his name has since been synonymous with hangman. All parts of England have in recent times depended upon the London executioner for the actual hanging. Calcraft and Marwood have been the best-known holders of the office in modern days. The Parisian executioner is familiarly styled *Monsieur de Paris*. The Sanson family have been the most distinguished bearers of this title. (Consult *Memoirs of the Sansons*, London, 1875.) It was one of this family who officiated at the execution of Louis XVI.

In all the American States a provision is made for such an official, but the title and duties differ in each. In many of the States the sheriff is the executioner in his particular county; but in large States like New York, where a State prison exists, the warden of that institution is technically, not practically, the executioner. In the United States army the provost marshal performs the duties of military executioner.

EXECUTIVE DEPARTMENT. The branch of government to which is confided the duty of executing the laws; in distinction from the legislative department, which enacts, and the judicial department, which interprets them. In the United States government the chief executive officer is the President; in the several States, the Governor. The secretaries of State, Treasury, Interior, Agriculture, War, the Navy, Commerce, and Labor, with the Postmaster-General and the Attorney-General, are commonly called chiefs of the executive departments. The Constitution does not recognize their existence, but custom has made them the President's advisers.

EXECUTIVE OFFICER. On a vessel in the United States navy, the officer of the line (or executive branch) next in rank to the captain. He is commonly appointed to this duty by the Navy Department; but in cases of detachment of the executive officer without another being sent in his place the next senior officer is then detailed by the captain. In battleships and large armored cruisers the executive officer is usually a commander; in smaller vessels, a lieutenant commander or officer of lower grade, depending upon the size of the ship. He is the aid and executive of the captain in all matters pertaining to the ship and its equipment devolves upon the first lieutenant (see **LIEUTENANT, FIRST**), but in those of less size this work also is controlled by the executive. He is "on duty" at all times when on board and has general supervision, under direction of the captain, of all matters connected with the organization, police, inspection, discipline, exercise, and efficient condition of the crew, and (if there be no first lieutenant) of the cleanliness, good order, and neat and trim appearance of the ship. When all hands are

called for the purpose of carrying on general drills, he has charge of the ship, subject to the direction of the captain. In battle he has general supervision of the battery and of all matters pertaining to the safety of the ship except her navigation.

EXECUTOR (Lat., performer, accomplisher). The personal representative of a decedent, appointed by last will and testament. His functions are to-day substantially those of an administrator and are limited to the administration of the personal estate of the testator. By the ecclesiastical law of England, however, by which his powers and duties were formerly regulated, his position was one of much greater consideration. There he was regarded much in the light of the heir (*hæres*) of the Roman law (from which the ecclesiastical law was mainly derived), and as the owner of the personal property left by the decedent. His duty was originally confined to the discharge of the funeral expenses and the debts of his testator and, later, of the personal legacies bequeathed by the will, the residue in his hands belonging to him absolutely. The right, universally recognized to-day, of the next of kin of the decedent to share the residuum of the personal estate among them, after payment of debts and legacies, is wholly due to a series of statutes, which have gradually reduced the executor to the position of an administrator.

As the expression "personal representative" indicates, the executor is entitled only to the personal rights of his testator, and not to those in our law denominated real; i.e., only the personal property and personal rights of action—as on contract, for debts due, etc.—accrue to him, while real property and rights of entry and actions for the recovery of freehold estates in land descend to the heir. Where, as is frequently the case, the executor is authorized by the will to sell real estate for the payment of debts, he does not thereby acquire any title therein, but only a power of appointment of sale. (See **POWER**.) The proceeds of such sale become equitable assets (q.v.) in his hands.

In this respect his position has always been different from that of the Roman *hæres*, who succeeded to the entire estate of his testator. Like the *hæres*, however, and unlike the English and American administrator, the title of the executor to the personal estate of the decedent vests at once upon the latter's death and is not dependent upon the probate of the will under which he claims, nor the issue of letters testamentary. It is only for the purpose of enabling him to maintain suits at law and as conclusive evidence of his authority that probate proceedings are necessary. It should be added that, while the restriction of the executor's estate and authority to the personal property of his testator is still generally observed, a few American States have by statute invested him with similar jurisdiction over the real estate, and that a similar change has recently been effected in the English law by the Land Transfer Act, 1897 (60 and 61 Vict., c. 65).

The duties of an executor are now usually prescribed by statute and may be briefly summarized as follows: *First*. To bury the decedent in a manner suitable to the estate. *Second*. To prove the will and take out letters testamentary. *Third*. To make and file with the probate court an inventory of the personal estate. *Fourth*. To collect the goods and chattels of the testator, and his claims against others, with reasonable

diligence. *Fifth.* To advertise for claims against the estate. *Sixth.* To pay the debts in the order of priority established by law. *Seventh.* To distribute the chattels and pay the legacies in accordance with the terms of the will. *Eighth.* To convert the surplus of personal estate, if any, into cash, and distribute it among the next of kin, according to the statutes of distribution. *Ninth.* To keep the money and other property of the estate safely and prudently. *Tenth.* To render an account whenever called upon by proper authority so to do, and to apply for a discharge upon a final accounting, within the time prescribed by statute for the completion of the administration.

Generally speaking, any one who is not mentally incompetent may be an executor; even infants, and married women under the common-law disability of coverture (q.v.). The court may compel an insolvent or nonresident executor to give security; but ordinarily an executor need not give security, unless (as is the case in some American States) he is required by statute so to do. No one is compelled to accept the office of executor against his will; but, having once been accepted, the duty cannot be renounced nor assigned to another, and the acceptance may be informal and even unintentional, as by taking possession of the estate, paying the executor's own claim out of money of the testator in his hands, etc.

Executor de Son Tort. A person not named in the will as executor may, by usurping the office, have its liabilities and many of its powers imposed upon him, without thereby acquiring its privileges and immunities. Such a person is known as an executor of his own wrong (*de son tort*). Any assumption of authority over the estate, or any interference with it, such as belongs of right to an executor, constitutes such a usurpation. An executor *de son tort* is liable only for such assets as come into his hands, and the acts of *de facto* administration performed by him are in general valid so far as other parties who deal with him in good faith are concerned.

In the law of Scotland the term "executors" is employed to describe the next of kin of a decedent, whether testate or intestate, who are entitled to share in the distribution of his personal estate, the person corresponding to the executor of English and American law being distinguished by the title of testamentary executor. See ADMINISTRATION; DISTRIBUTION; HEIR; PERSONAL REPRESENTATIVE; WILL. Consult: Burn, *Ecclesiastical Law* (30th ed., London, 1869); Williams, *The Law of Executors and Administrators* (9th ed., ib., 1893); Crowell, *The Law Relating to Executors and Administrators* (St. Paul, 1897); Woerner, *The American Law of Administration* (2d ed., Boston, 1899); Schouler, *Treatise on the Law of Executors and Administrators* (4th ed., ib., 1910); Ingpen, *The Law Relating to Executors and Administrators* (2d ed., London, 1913).

EXECUTORY DEVISE. A testamentary gift of a future interest in real or personal property of such a nature that it cannot be brought within the technical description of a remainder. In its earlier period the common law recognized no future estates in personal property, nor any in real property but reversions and remainders. Both of these were the remnants of a freehold out of which a smaller estate had been "carved," as the expression was, and given to another. If this remnant was retained by the former free-

hold tenant, it was a *reversion*; if it was, at the time of the creation of the lesser estate, given to a third person, it was a *remainder*. Thus, if a tenant in fee simple made a conveyance of a life estate, he still had a fee simple which was conceived of as reverting to him at the expiration of the life estate, or which he might vest in another as a remainder. In either case the future estate, to be valid, must fit exactly upon the precedent estate. An interval of even a day between the two rendered the attempted future estate void. Neither could there be a remainder to take effect in the future without a preceding estate "to support it," nor could a remainder be created after or in derogation of a fee simple.

The practice of conveying lands to the use of, or in trust for, others, which prevailed in England during the fifteenth and sixteenth centuries, opened the way for the recognition of certain future interests in land which were not permitted by the rigid and artificial common-law system, and the famous Statute of Uses, passed in the twenty-seventh year of Henry VIII (1535), stereotyped these interests into new legal estates, known as *springing* and *shifting uses*. The Statute of Wills (32 Hen. VIII), which for the first time permitted the free alienation of lands by will, enabled testators to create the same interests more simply and directly by testament, under the description of executory devises. These were of two classes, corresponding to the shifting and springing uses, the former including future estates to take effect in substitution for a preceding fee simple—as a gift of land to A and his heirs, the same to go to a charity if A or his heirs ever ceased to occupy the premises so given; the second comprehending future interests to arise on a future event—as a devise to B when he should attain the age of 21 years. In the form here described, executory devises have continued to be a recognized form of testamentary disposition of real estate, and the expression has also been extended by analogy to include certain future interests in personal property which have acquired legal recognition.

This form of limitation is restrained by the law against perpetuities (q.v.), which requires that the estate must take effect within a life or lives in being and 21 years after. The law will not interpret a limitation as an executory devise if it can be otherwise sustained. Whenever, therefore, a future interest in land is so devised as to fall within the rules laid down for the limitation of contingent remainders, such devise will be construed as a contingent remainder and not as an executory devise. An executory devise, unlike a remainder, could not be defeated by any act of the first taker or devisee; when, therefore, an absolute power of disposition is in the first taker, the limitation over is not an executory devise. See DEVISE; FUTURE ESTATE; REMAINDER; USE AND OCCUPATION.

EX'EDRA (ἐξέδρα, from ἐξ, out + ἔδρα, a seat). Among the Greeks and the Romans a seat built out from a portico or colonnade, usually semicircular, and sometimes roofed over with a hemispherical vault. They were used as pleasant places for conversation. They were sometimes out of doors, as in the Street of the Tombs at Pompeii, sometimes parts of buildings, as of the great thermæ at Rome. Exedrae have been built also in modern times, notably in the famous Sieges-Allée in Berlin.

EX'EGE'SIS (Neo-Lat., from Gk. ἐξηγέσις,

exēgēsis, explanation, from ἐξηγεῖσθαι, *exēgeisthai*, to explain, from ἐξ, *ex*, out + ἡγεῖσθαι, *hēgeisthai*, to lead, from ἄγειν, *agein*, to lead) OF THE BIBLE.

OF THE OLD TESTAMENT

The Bible of the apostolic church was, naturally, the Scriptures of the Jews, and these Scriptures mainly in the Greek translation, since the popular ignorance of the Hebrew language among the first Hellenistic and Gentile converts to Christianity rendered direct use of the original text impossible, acquaintance with this text being largely limited to the Jewish Christians of Palestine. Concerning the interpretation of these Scriptures by the immediate disciples of Jesus, we have no certain information. It may be inferred, however, from such documents as we possess, that their exegesis of the law did not differ materially from that of the earlier rabbis in the Mishna, while their haggadic interpretation of the prophets and the Psalms was such as to furnish them with proofs of the Messiahship of Jesus and with material for His life. This attitude was preserved, even beyond the middle of the second century, in the Ebionitish circles, whence some of the Clementine writings proceeded. But the identity of Judaism and Christianity could be maintained only at the sacrifice of certain parts of the law that were declared unprophetic, and therefore un-Mosaic. In this connection observations of style are introduced in which the beginnings of literary criticism may be discerned. A fresh impulse in the direction of an allegorizing exegesis was given by Gnosticism. When men like Valentinus and his disciples, Ptolemy and Heracleon, Basilides and Isidore, Saturninus and Carpocrates, Marcion and Tatian, embraced Christianity, it was impossible for them to be satisfied with even the most liberal attitude of the Christian Jew. No synagogue training prevented them from measuring "the God of the Jews" by the standard furnished by the Christian revelation, and the commandments of the Law by standards of Christian worship and morals. An effective defense of the Catholic side could only be made by the chastened Gnosticism and allegorizing interpretation that meet us in Hebrews, Barnabas, Colossians, Ephesians, the Pastorals, and the Fourth Gospel. The same method and speculation were characteristic of Justin (died c.166), Pantænus (died c.190), Clement of Alexandria (died c.215), and Origen (died c.254). As a textual critic and as a thinker, Origen easily holds the foremost place among the early fathers, though his knowledge of Hebrew was inferior to that of Jerome. His allegorical method was followed by Dionysius (died 265) and Gregory Thaumaturgus (died c.270); and, to a large extent, by Eusebius (died c.340), Athanasius (died 373), the three Cappadocians, Basil (died 379), Gregory of Nyssa (died c.395), and Gregory of Nazianzus (died c.390); Ambrose of Milan (died 397), and Cyril of Alexandria (died 444). On the other hand, the foundations of a sound historico-grammatical interpretation were laid by the school of Antioch, whose chief representatives were Theodore of Heraclea (died 350), Eusebius of Emesa (died c.360), Diodorus of Tarsus (died 394), Chrysostom (died 407), Theodore of Mopsuestia (died 429), his brother Polychronius, and Theodoret of Cyrus (died c.457). Especially the criticism of Theodore of Mopsuestia was often very keen.

Ephraem Syrus (died 378) also devoted himself particularly to a grammatical explanation of the text, and the school of Nisibis seems to have been comparatively free from allegorizing tendencies, as may be seen from the conception of the Bible which Junilius (died 552) declares that he has received from Paul the Persian. Through Jerome (died c.420) and Augustine (died 430), however, the interpretation that sought to discover a double or manifold sense became dominant in the Latin church. Jerome possessed a deeper knowledge of Hebrew, acquired from Jewish teachers in Palestine, than any other patristic writer, and had great skill as a translator; while Augustine knew no Hebrew and little Greek, but often understood the meaning of the text better. Though he had neither the erudition of Jerome nor the genius of Augustine, Faustus of Mileve (born 344) was a greater critic than either, anticipating some important positions of modern scholarship.

In the sixth century commentators like Cassiodorus (died c.580) and Procopius of Gaza (died 520) began to give a conspectus of earlier interpretations in so-called "chains" (*catenæ*, *scipai*), and Cosmas Indicopleustes (c.550) gave a summary of authorship, purpose, and contents of the biblical books. The learned Isidore of Seville (died 630), Bede (672-735), and Alcuin (died 804) largely epitomized Jerome. These excerpts from the fathers were much reduced in the *Glossa Ordinaria* of Walafrid Strabo (died 849), and by the learned Rabanus Maurus (died 856), who already seems to have given some attention to the Hebrew; also by Haymo of Halberstadt (died 853) and Remigius of Auxerre (died 890). With Johannes Scotus Erigena (died c.891) the allegorical interpretation covered many views in advance of his age, on the creation, the fall of man, the last things, and other subjects. Lanfranc (c.1005-89) continued Alcuin's labors for the purification of the Latin text. Anselm of Laon (died 1117), in his *Glossa Interlinearia*, Rupert of Deutz (died 1135), and Hugo of St. Victor (died 1171) pursued the fourfold sense of Scripture—historical, allegorical, tropological, and anagogic; and even men like Thomas Aquinas (died 1274), Bonaventura (died 1274), and Albertus Magnus (died 1280) did not break with the prevailing method. But the teaching of Abélard (died 1142) and the Nominalists had a tendency to call the attention away from types and allegories, and Roger Bacon (died 1294) applied his method, not only in the study of natural objects, but also as a textual critic. In order to convert the Jews and Moslems, to dispute successfully with them, or even to expurgate their books, it became necessary to learn the Hebrew and Arabic languages. Seminaries where Hebrew and Arabic were taught began to be founded in the thirteenth century, and the Council of Vienne (1311) ordained that chairs of Hebrew, Arabic, and Aramaic should be established in Paris, Bologna, Oxford, and Salamanca. The results of this new impulse are seen in the *Pugio Fidei* of Raymond Martini (died 1296) and the *Postilla* of Nicolas of Lyra (died 1340). Both of these authors were familiar with Talmudic and Rabbinic writings, as well as with the Hebrew Bible, and especially the latter drew largely upon Solomon ben Isaac (Rashi).

The Renaissance brought an improved critical method, as well as increased knowledge of classical antiquity. Of great importance was the

criticism of sacred texts and traditions by Lorenzo Valla (died 1457). Such Hebraists as Johann Wessel (died 1489), Pico della Mirandola (died 1494), Conrad Pellicanus (Kürschner, died 1556; his grammar appeared 1503), and Johann Reuchlin (died 1522) facilitated the philological study of the Bible. The exegesis of Franz Vatablus (Vatblé, died 1547), Santes Pagninus (died 1541), Johannes Maldonatus (died 1583), and Gilbert Génébrard (died 1597) was based on the Hebrew text as well as on the Latin and Greek versions and sought to discover the literal sense. Even Titelmann (died 1530) and Cajetan (died 1534), who knew the original only through Latin translations, recognized its importance and discarded allegorizing. The learned lawyer Andreas Masius (Maes) in 1574 published an important commentary on Joshua, in which he maintained that the Pentateuch had been compiled by Ezra from documents of different ages. Great services were rendered to textual criticism by Ximenes through his editions of the Bible in the Complutensian polyglot (1514-17); Arias Montanus, as editor of the Antwerp polyglot (1569-72); Pierre Morin and Antonio Caraffa, by editing the Sixtine edition of the Greek Bible (1587); and Robert Stephanus (Estienne) in preparing for the press the Latin Vulgate (1532).

Martin Luther (died 1546) broke in principle with the allegorical method, though his exegesis still shows its lingering fascination and is at times unduly influenced by dogmatic considerations. While he recognized the importance of the Greek and Latin versions, he leaned somewhat too confidently on the Masoretic text as the "veritas Hebraica." He opposed the authority of the Bible to that of the Church, yet in determining the canonicity and relative value of the books he depended largely upon his own subjective judgment. His German version is an admirable achievement and exercised a great influence on the interpretation of the Bible among Protestants. Philip Melancthon (died 1560) and Johannes Brentius (Brenz, died 1570) possessed a good equipment for exegetical work. Ulrich Zwingli (died 1531) and Johannes Œcolampadius (Hausschein, died 1531) were also sober and capable exegetes. But easily the foremost interpreter of the Bible in the sixteenth century was John Calvin (died 1564). His knowledge of Hebrew may have been less than Luther's, but his exegesis is freer from irrelevant digressions, observes more keenly the connection of thought, and attempts to explain what needs explanation. Philologically the commentaries of Johannes Mercerus (Mercier, died 1570) are of great value. Less important are those of Theodore Beza (died 1605). Among the more radical interpreters of the time Andreas Bodenstein Carlostadt (died 1541), Johannes Denck (died 1529), Sebastian Castalio (Chateillon, died 1563), and Michael Servetus (died 1553) deserve to be mentioned. Carlostadt wrote discriminatingly on the canon, and his remarkably keen literary criticism led him to reject the Mosaic authorship of parts of the Pentateuch. Denck interpreted the Bible as an expression of the spirit that enlightens every man and, instead of Church or Bible, made the Christian consciousness the ultimate judge of truth. His translation of the prophets was valued and used both by Luther and in the Zurich Bible. Chateillon recognized the true character of Canticles and urged its exclusion from the canon. In editing

Santes Pagninus' Latin translation Servetus expressed in notes some very advanced ideas.

During the seventeenth century marked contributions to biblical interpretation were made by Catholic scholars, especially by members of the Society of Jesus and the Oratorians. Among the former, Bento Pereira, in 1600, and Jacques Bonfrère, in 1625, called attention to post-Mosaic material in the Pentateuch. Athanasius Kircher (died 1680) laid the foundations of our knowledge of Coptic and began to use it for the elucidation of the Bible. Cornelius à Lapide (van den Steen, died 1637) prepared a learned commentary on the whole Bible. Two fathers of the Oratory, Jean Morin (died 1659) and Richard Simon (1638-1712), rendered distinguished services to biblical science—the former chiefly by his Samaritan studies and his recognition of the late date of the vowel points, the latter by his excellent critical history of the Old Testament (1678), in which he set forth the evidences against the Mosaic authorship of the Pentateuch. Of importance was also the publication by Michael le Jay of the Paris polyglot in 1629-45. The comments of Catholic interpreters such as Emmanuel de Sa (died 1596), Wilhelm Estius (died 1613), and Tirin (died 1636), were gathered together by Jean de la Haye in his *Biblia Magna* (1643) and *Biblia Maxima* (1660). Among the Protestants, Johannes Drusius (van den Driesche, died 1616); Johannes Piscator (Fischer, died 1626); Joseph Scaliger (died 1609), who first brought Israel's history into connection with the history of Semitic antiquity; Hugo Grotius (de Groot, died 1645), whose sober exegesis eliminated a mass of supposed Messianic prophecies; Louis de Dieu (died 1642); Johann Heinrich Hottinger (died 1667); Samuel Bochart (died 1689); Sebastian Schmidt (died 1696); and August Pfeiffer (died 1698)—by their works contributed to the understanding of the Bible. The most learned Hebraists of the time were Johann Buxtorf (died 1629) and his son, Johann Buxtorf (died 1664). Their contention for the high age of the vowel points influenced deeply theological thought. It is the chief merit of Louis Cappel (died 1658) that he upheld the truth, now universally recognized, against their error. In England, Bryan Walton (died 1661), the editor of the London polyglot; the eminent Orientalists Edmund Castle (died 1685) and Edward Pocock (died 1691); John Pearson (died 1686), one of the editors of the great compilation *Critici Sacri* (1680); Matthew Poole (died 1679), editor of the *Synopsis Criticorum* (1669-76); John Selden (died 1654); John Lightfoot (died 1675), the student of rabbinic lore; John Spencer (died 1693), who first viewed Hebrew ritual in the light of the customs of other nations; Thomas Hobbes (died 1679), whose *Leviathan* (1651) paved the way for a more fruitful literary criticism; and Charles Blount (died 1693), who showed the disparity between the account of creation in Genesis and the facts discovered by science—all rendered service in biblical interpretation.

Possibly the most important contributions of Catholic scholars in the eighteenth century were made by Charles François Houbigant (died 1783), whose Latin translation was made for the first time throughout from a Hebrew text, amended by conjectural criticism (1753); Jean Astruc (died 1766), who in the same year published his epoch-making conjectures as to the documents used by Moses in the composition of

Genesis; Augustine Calmet (died 1757), who published the first Bible dictionary; and Alexander Geddes (died 1802), who first embodied in a commentary (1792-97) the results of Pentateuchal documentary analysis. The intense study of natural science in England caused the critical inquiries of the Deists. After Herbert of Chesham and Charles Blount it was especially Anthony Collins (died 1729), the first in modern times to recognize that Daniel was written in the Maccabean age, though it had long been perceived that the events of this time were referred to, and John Toland (died 1722), whose labors advanced biblical science. On the other hand, the Quaker movement developed a conception of religious liberty and a reliance upon subjective judgment from which biblical interpretation ultimately derived great benefit. For the appreciation of Hebrew poetry Robert Lowth's treatise upon the subject in 1753 was of utmost importance. The Bible edition of Benjamin Kennicott (1776-80), together with its necessary supplement, G. B. de Rossi's *Variae Lectiones* (1784-88), made it evident that all extant manuscripts represent substantially the same text recension, though it was reserved for scholars in recent times to see the value of the numerous variants they presented. The still indispensable edition of the Greek Bible by Holmes and Parsons (1798-1827) was also begun in this century. J. Clericus (le Clerc, died 1736) made the Continent acquainted with the work of the English Deists and enriched science with excellent commentaries. Hadrian Reland (died 1718) and Albert Schultens (died 1751) elucidated the text by their historical and philological investigations. Campegius Vitringa (died 1722) wrote a learned exposition of Isaiah, and J. G. Carpzov (died 1767) an excellent introduction to the Old Testament. Akin to the Deists, but more learned, was Hermann Samuel Reimarus (died 1768), whose *Wolfenbüteler Fragmente*, published by Lessing in 1774, searchingly examined the Pentateuch. Voltaire (died 1778) drew from English thinkers many of the arguments with which he undermined traditional beliefs concerning the Bible. Meanwhile the Quaker leaven was spreading. Pietistic exegesis was at first allegorizing, but gradually became infected with rationalism. The transition may be seen in Zinzendorf (died 1760), Edelmann (died 1767), C. F. Bahrdt (died 1792), and J. D. Michaelis (died 1791); but especially in Johann Salomo Semler (died 1791), whose discussion of the canon proved of great value, and Heinrich Corrodi (died 1793), whose studies of the chiliastic movements prepared him to understand the Book of Daniel. J. G. Herder (died 1803) contributed greatly to an understanding of Canticles and other poetic parts of the Bible. Influenced by the philosophy of Christian Wolff (died 1754), and that of Immanuel Kant (died 1804), a rationalistic school of biblical interpretation was formed, among whose chief representatives H. E. G. Paulus (died 1851), by his studies of prophecy and of the Book of Joshua; Karl David Ilgen, by his remarkable work on the documents in the temple archives at Jerusalem (1798); and Paulus's disciple, Johann Gottfried Eichhorn, by his masterly introduction (1780-83), particularly furthered biblical exegesis.

The nineteenth century witnessed a marked progress in the interpretation of the Hebrew Bible. Among the Catholic exegetes Johann Jahn (died 1816), J. G. Herbst (died 1836), Franz

Kaulen, and J. Cornely, by their introductions; Anton Scholtz, by his bold and thorough textual criticism; and Gustav Bickell, by his meritorious studies of Hebrew poetry, deserve special mention, though many others made substantial contributions. But the leadership in biblical exegesis was maintained by Lutheran theologians in Germany. It was largely, if not wholly, due to their influence that competent and independent interpreters appeared in other European countries and in America in the latter part of the century. Hegel, Schleiermacher, and De Wette made a deep impression upon theological thought, and their disciples reached with a bound many critical positions to which a later generation has been forced back after a significant and valuable reaction. W. M. L. de Wette (died 1849) recognized the mythical and legendary element in the Pentateuchal narratives, placed the date of the Deuteronomic law in the reign of Josiah, and discussed the character of the Chronicler's historiography. He became the chief representative of the fragmentary hypothesis of Geddes, introduced into Germany by Johann Severin Vater in 1802, though the possibility of a more extended document supplemented by later hands, which was presented by Stihelin, Bleek, and Ewald, subsequently attracted him. His pupils, C. P. W. Gramberg in 1820, Wilhelm Vatke and J. F. L. George in 1835, under the influence of Hegel's philosophy of history, traced the growth of customs and ideas, anticipating some important conclusions reached by later exegetes under the influence of the philosophy of evolution. Bruno Bauer in 1838 discussed the true character of the Book of Job and advocated its postexilic origin. The ripest exegetical fruit of the rationalistic school was the commentary on Isaiah published in 1821 by Eichhorn's pupil, Wilhelm Geseus (died 1842). That some of the critical positions were temporarily lost was not so much due to the vain attempts of Hengstenberg (died 1869), Hävernick (died 1845), and Keil (died 1894) to rehabilitate traditional views, as to the natural suspicion of a construction of Israel's history based on philosophical assumptions and to a truer appreciation of the potency of personality as against impersonal force. Quite the most influential Old Testament exegete of the middle of the century was Heinrich Ewald (died 1875). His learning, insight, and independence admirably fitted him to interpret the prophets and poets of Israel, but his sense of the historic development was not so keen. His most eminent disciple, August Dillmann (died 1894), in his learned and critical commentaries, maintained some of Ewald's conservatism. Justus Olshausen, in his commentary on the Psalms (1853), first perceived clearly the essentially Maccabean background. Hermann Hupfeld (died 1866) in the same year brought Pentateuchal criticism back to the documentary hypothesis by his characterization of the sources of Genesis, and later wrote an excellent commentary on the Psalms. The critical investigation of Jeremiah, begun by F. C. Movers in 1837, was carried on by Ferdinand Hitzig (died 1875), who also elucidated the Psalms and the minor prophets by his keen textual and literary criticism. The commentaries of August Knobel (died 1863) were marked by great erudition. In 1866 Karl Heinrich Graf maintained that the laws of the so-called priestly code were postexilic; and the character of this literary stratum was searchingly examined by the distinguished

Semitic scholar Theodor Nöldeke in 1869. Of great importance was the series of contributions by Julius Wellhausen to Pentateuchal criticism, begun in 1876, to which he added a careful study of the text of Samuel (1871) and suggestive notes on the minor prophets (1892). The brilliancy of his style, the cogency of his reasoning, and the harmony of his conception of history with the doctrine of evolution have given a wide currency to his views. In 1881 the *Zeitschrift für alttestamentliche Wissenschaft* was founded by Bernhard Stade (died 1906). In it much valuable work has appeared—none more important than that of the editor himself, whose critical acumen not less than his historical insight was also seen in his history of Israel (1888). Another admirable historian, Eduard Meyer, also enriched biblical criticism by many a contribution, notably by his studies of Ezra and Nehemiah (1896). Adalbert Merx, in an exceedingly learned and valuable commentary on Joel in 1879, paved the way for an understanding of that book. Karl Budde, by his *Biblische Urgeschichte* in 1883 and his studies on Judges and Samuel, as well as by his important discovery of the Kina metre, has done good service to biblical exegesis. Karl Siegfried by his painstaking studies in Hellenistic philosophy was admirably prepared for his thorough investigation of Ecclesiastes (1893). An exegete of marked originality and great ability is Bernhard Duhm, whose commentaries on Isaiah in 1892, on the Psalms in 1899, and on Jeremiah in 1901 have proved very helpful. Sympathetic insight and critical independence also mark the commentary on Genesis by Hermann Gunkel (1901; 3d ed., 1912). What is best in *Bunsen's Bibelwerk* comes from Adolf Kamphausen's hand. The contributions by Franz Delitzsch (died 1890) to the Keil-Delitzsch commentaries are particularly valuable for the author's profound knowledge of rabbinic lore. August Klostermann's commentary on Samuel and Kings (1887) exhibits a textual criticism as startlingly bold as the exegesis is conservative. Rudolf Smend's commentary on Ezekiel (1880) is particularly important. The series of commentaries edited by Michael Wilhelm Nowack contains many good expositions, and that edited by Karl Marti contains, among others, good commentaries by the editor himself on Isaiah (1900), the minor prophets (1904), and Daniel (1896). Karl Heinrich Cornill, in his study of the text of Ezekiel (1886), showed himself an excellent textual critic. No contributions to textual criticism during the nineteenth century were more significant than those of Paul de Lagarde (died 1891), whose marvelous native resources, philological and philosophical, were mainly devoted to the Greek version. In the twentieth century the studies of the Greek text have been effectively carried on by A. Rahlfs; and R. Kittel, with several coadjutors, has furnished a convenient edition of the Hebrew Bible, with a useful, though necessarily limited, textual apparatus (last ed., 1912). Luther-Meyer's *Die Israeliten* (Halle, 1906), Kittel's *Geschichte Israels* (2d ed., Gotha, 1912), Hugo Gressmann's *Mose und seine Zeit* (1912), and the translations with introductions and comments edited by Emil Kautzsch, Karl Marti, and Hermann L. Strack, have furthered exegesis.

In Holland Abraham Kuenen (died 1891), H. Oort, W. H. Kusters (died 1897), J. C. Matthes, and G. Wildeboer have rendered especially valu-

able services to biblical interpretation. Kuenen, a most conscientious and painstaking scholar, was the first to maintain that the priestly sections, narrative as well as legislative, were post-exilic. Kusters first searchingly inquired into the historical character of the story of the return from Babylon. In the present century B. D. Eerdmans, by a searching criticism, has shown the necessity for a new consideration of the Pentateuchal problem. He is editor of the influential *Theologisch Tijdschrift*. In France Eduard Reuss (died 1891) as early as 1833 expressed his conviction that Leviticus was post-exilic, and by his excellent translation of the entire Bible with commentary spread the results of a more fruitful Bible study among his countrymen. Ernest Renan (died 1892) commented with particular success on Ecclesiastes. The important epigraphical labors of eminent French scholars, particularly Clermont-Ganneau, have also been of considerable value to interpretation. The *Revue Biblique Internationale* has become the leading French journal devoted to biblical exegesis and archaeology; its editor, the learned Dominican Joseph Lagrange, by his commentary on Judges (Paris, 1903) and other works, and Hugue Vincent by his archaeological studies have greatly furthered biblical science. In Great Britain Samuel Davidson, in editing the tenth edition of Horne's introduction (1856), introduced a more scientific view of the Hebrew Bible. More important, however, was the acute criticism of the Pentateuch and Joshua by J. W. Colenso (1862-79). Rowland Williams contributed to the understanding of the prophets (1866). By his thorough knowledge of Arabian antiquity W. Robertson Smith (died 1894) was able to throw much light upon the biblical writings. A. B. Davidson (died 1902) was a thoughtful and independent expositor. Samuel R. Driver (died 1914), by his introduction, his commentaries, and his contributions to Hastings's *Dictionary of the Bible* (New York, 1904), of which he was one of the editors, won well-deserved confidence as an interpreter of the Bible. Thomas K. Cheyne is an acute textual critic and a resourceful and sympathetic expounder of the thought. His earlier works upon Isaiah and the Psalter and in the *Encyclopædia Biblica* (4 vols., New York, 1899-1903) have distinctly advanced biblical science. German methods of interpretation became known in America through an essay on Messianic prophecy by George R. Noyes, in 1834, John G. Palfrey's lectures on Jewish history (1840), and Theodore Parker's translation of De Wette's introduction (1840). Since 1881 the Society for Biblical Literature and Exegesis has published a *Journal of Biblical Literature* (Boston, 1882-) distinctly devoted to the interpretation of the Bible, and many valuable contributions have been made in its pages by American scholars. Most of the contributors to the *International Critical Commentary* (New York 1895-) are Americans. The volumes of this work that have thus far appeared are: *Genesis* by John Skinner, *Numbers* by G. B. Gray, *Deuteronomy* by S. R. Driver, *Judges* by George F. Moore, *Samuel* by Henry P. Smith, *Chronicles* by A. B. Curtis, *Ezra and Nehemiah* by L. W. Batten, *Psalms* by G. A. Briggs, *Proverbs* by C. F. Toy, *Ecclesiastes* by G. A. Barton, *Isaiah* by G. B. Gray, *Amos and Hosea* by W. R. Harper, *Haggai, Zechariah, Malachi, and Jonah* by Mitchell, Smith, and Bewer, *Micah, Zephaniah, Nahum, Habakkuk,*

Obadiah, and Joel by Smith, Ward, and Bewer, and *Esther* by L. B. Paton. The *Messages of the Bible* (New York, 1899-1911) contains commentaries on the *Historians and Psalmists* by John E. McFayden, the *Largivers* by Charles F. Kent, the *Prophets* by Frank K. Sanders and Kent, *Daniel* by F. C. Porter, *Job, Canticles, and the Minor Poems* by N. Schmidt; and the *Bible for Home and School* (New York, 1908-13) contains commentaries on *Genesis* by E. G. Mitchell, *Job* by Barton, *Judges* by Curtis, *Deuteronomy* by Jordan, and *Isaiah* by McFayden. Of the *Polychrome Bible*, edited by Paul Haupt, presenting, in different colors to indicate the different literary strata, a critically restored text and the translation into modern English of this text, a large number of volumes has appeared, though the work is not yet quite complete. Among recent commentaries written by English scholars the *Pulpit Commentary* (London, 1880-) and the *Expositor's Bible* (New York, 1901-), but especially the *Cambridge Bible for Schools and Colleges* (Cambridge, 1905-), and the *Century Bible* (New York, 1901-13), should be mentioned, and among recent exegetes particularly W. H. Bennett, H. A. A. Kennedy, S. A. Peake, and R. H. Charles.

On the books not found in the Hebrew Bible, but extant in the Greek Bible and included in the canon of the Roman Catholic church, much valuable work has been done by C. F. Fritzsche, the contributors to Kautzsch's *Apokryphen*, T. André, John Howorth, C. C. Torrey, and the contributors to Charles's *Apocrypha* (see DEUTEROCANONICAL BOOKS); and on the books regarded by other early churches as belonging to the Old Testament, especially by Friedrich Lücke, Adolf Hilgenfeld, August Dillmann, Emil Schtärer, R. H. Charles, the contributors to Kautzsch's *Pseudepigraphen* (Tübingen, 1902) and to Charles's *Pseudepigrapha* (Oxford, 1913), and Székely's *Bibliotheca Apocrypha* (Freiburg, 1913).

OF THE NEW TESTAMENT

To the Jewish Scriptures were gradually added by the post-Apostolic Church the distinctive writings of the Apostolic age, as of the same authoritative inspiration as the older writings, and, consequently, open equally with them to the study of the Church. The first of these Christian writings to be studied were those which contained the life and teachings of Jesus, the earliest-known example of such study perhaps being the reputed work of Papias (c. 140), entitled *An Exegesis of the Sayings of Our Lord*, and based upon at least the Gospels of Matthew and Mark. Other efforts at Gospel exposition appear in the *Exegetica* of the Gnostic Basilides (died c.140), the *Hypomnemata* of the Valentinian Heracleon (c.150), and in the commentary on the Gospels held by some critics to have been written by Marcion (c.150). These works are preserved only in fragments, and from the little known of them they seem to have been written not only in a dogmatic spirit, which was doubtless due to the heretical position that most of the writers maintained toward the Church, but also after the allegorical method, which was the controlling principle of all interpretation in that age.

Evidence of this tendency to study the Gospels is further furnished by such works as Tatian's *Diatessaron* (c.170), an attempt to weave out of the four Gospels a single story

of the life and teaching of Christ, on which composite Gospel Ephraem Syrus wrote a commentary; and by Marcion's reconstruction of the Gospel of Luke as the sole basis for the Gospel narrative. In fact, the numerous apocryphal Gospels are themselves witness to the primary interest which the second century took in the Gospel traditions.

No genuine exegesis of the New Testament writings, however, was produced until the rise of the Alexandrian school in the latter part of the second century, the most illustrative representative of which was Origen (c.185-254). His exegetical writings may be separated into three groups, which differ among themselves largely in the object they have in view. The first group (*Scholía*, Notes) consisted of brief exegetical remarks intended mainly for the elucidation of difficult passages; the second group (*Homiliai*, Homilies) consisted of expository discourses delivered in connection with public worship, and having as their purpose the instruction and edification of the general congregation; the third group (*Tomoi*, Volumes) consisted of elaborate treatments of entire books of Scripture, with a view to making them intelligible to the more educated class. Of these groups only the last dealt in any comprehensive way with the New Testament. But in this group all the Gospels were treated, with the exception of Mark, and all the Epistles, excepting 1 and 2 Corinthians and 1 and 2 Timothy. No commentary is known on Acts, and it is uncertain whether he wrote on the Catholic Epistles and the Apocrypha. The spirit of this school's exegesis was, like that of the previous writers, dominantly dogmatic, while its method carried the use of allegory to a further extreme.

More historical in both spirit and method was the North African school, represented by such men as Tertullian (c.200) and Cyprian (died 258), though it has left us nothing in the way of specific expository or commentarial work.

Antagonistic to the Alexandrian school stood the Syrian schools of Edessa and Antioch. The former of these had as its leader Ephraem Syrus (died 378), who produced both homilies and commentaries, the latter extending over the whole Bible, the portion on the Epistles of Paul being preserved in an Armenian translation. The leader of the latter school was Theodore of Mopsuestia (350-429), a scholar of commanding influence in his day, whose exegetical labors were extensive, though of his New Testament work only a Latin translation of his commentaries on Philipians, Colossians, and the Thessalonians, together with numerous Greek fragments from his treatment of other portions of the canon, have been preserved. The method of these schools, in distinction from the allegorical method of the Alexandrian school, was characteristically historical, having as its aim the discovery of the literal sense of Scripture; at the same time their conception of the doctrinal purpose of Scripture study compelled them frequently to resort to the hidden sense of the passage when the literal sense did not suffice. The exegetical influence of these schools, especially of the Antiochian, was far-reaching among the scholars of that day. The most illustrious example perhaps is found in Chrysostom (died 407), who, though developing his work most conspicuously in the form of the Origen homily, in which he covered almost the

entire New Testament, wrought it out under the historical principles laid down by Theodore. Under this same influence, to a larger or less extent, stood also Athanasius (died 373), Basil (died 379), Gregory of Nazianzus (died c.390), Ambrose (died 397), Gregory of Nyssa (died c.395), Isidore of Pelusium (died 431), and Theodoret (died c.457). Unfortunately, however, this influence, while to some extent it made itself felt with all scholars of the fifth century, did not remain dominant with them. Theodore's doctrinal opposition to Origen raised against him the cry of heresy that finally brought him and his exegesis into disfavor, allowing Origen's allegorical principles to secure for themselves again a position of power, from which they were not dislodged until the Renaissance brought a new learning to the aid of a scientific method. This reviving influence of Origen is seen as early as Jerome (died c.420), whose exegetical labors, comprehending most of the New Testament, as well as of the Old, disclose a significant return to allegorizing; while it appears later in Augustine (died 430), who elaborated the threefold sense of Scripture suggested by Origen into a fourfold sense; and in Cyril of Alexandria (died 444), who became one of the most pronounced opponents of the Antiochian school.

The complete control of the allegorical exegesis, however, is seen in the mediæval period, which extended from the seventh to the fourteenth century. Its chief contributions were either excerpts from the exegetical writings of the fathers, or glosses upon them, the dominant purpose in all of which work was the support of the doctrines of the Church, and their method mainly the elucidation of the hidden, allegorical sense. In the Eastern church Origen, Chrysostom, and Cyril of Alexandria formed the favorite sources for these compilations, while the chief compilers in the New Testament field were Nicetas of Heracleon (eleventh century) and Macarios Chrysocephalos (fourteenth century). To these should be added Eusebius (died 990), Enthymius Zigabenus (died 1118), and Theophylact (died 1107), whose commentaries, while possessing considerable original material, were, after all, compilative in character. In the Western church, where the material was drawn mostly from Ambrose, Hilary, Augustine, and Jerome, this reproductive method was most extensively followed, its more prominent examples in the New Testament field being Cassiodorus (died c.580), Bede (died 735), Alcuin (died 804), Rabanus Maurus (died 856), Peter Lombard (died c.1160), and Aquinas (died 1274); to whose more or less excerptive works should be added the distinctive glossaries of Strabo (died 849), Anselm of Laon (died 1117), Hugo of St. Caro (died 1263), and Nicolas of Lyra (died 1340). With the last-named writer, however, began the dawn of a better exegesis. He had a knowledge of both Hebrew and Greek, which enabled him to guard against the allegorical absurdities that had been perpetrated upon the Church by ignorant men. While, therefore, he retained Augustine's conception of a fourfold sense in Scripture, he gave such preference to the literal sense as to make his glossary the most important contribution to exegetical study before the Reformation. With Nicolas of Lyra should be placed Lorenzo Valla (1406-57), whose independent spirit and liberal views made

his *Annotations on the New Testament* a classic in the early Reformation times.

The exegesis of this early Reformation period was characterized by the revival of learning which marked the age. This is clearly seen in the exegetical work of Erasmus (c.1486-1536), the most conspicuous figure in this age. His publication of Valla's *Annotations* (1505), his edition of the New Testament in Greek, with comments on his emendations of the Vulgate text and explanations of different Scripture passages (1516), and even his more elaborate paraphrases of the Gospels and Epistles (1517-24), all of which had profound influence upon the growing thought of the period, were conceived more in appreciation of the scholastic value of the original language of Scripture for doctrinal truth than in appreciation of the doctrine itself. Under similar influence of humanism, but with more of the Reformation attitude towards the doctrinal truth, stood Faber Stapulensis (c.1450-1536), who produced a new Latin translation of the Pauline Epistles, accompanied by a commentary (1512), a commentary on the Gospels (1522), and also on the Catholic Epistles (1525), and the first French version of the entire Scriptures—the New Testament being issued in 1523, five years before the Old—a version which formed the basis of the translation of Olivetan (1535); and also Justus Jonas (1493-1555), the first of whose commentaries (Corinthians, 1520) represented the humanism of Erasmus, but whose later work (Acts, 1524) was written in the evangelical spirit of the Reformation.

With the Reformation came a new era of exegesis. The scholarship of humanism continued, but with it was united a new view, which regarded the Bible as the sole and infallible rule of faith by personal interpretation. It was this personal element which formed the soul of the Protestant movement. The revival of learning had made the Scriptures an object of extraordinary study, but to the reformer these Scriptures were not merely a book for learning; they stood in a supreme way as a living revelation from God, the centre and circumference of which was Jesus Christ. Upon Him naturally, therefore, all exegesis was focused, and from Him it gathered a personal relation towards all the Scriptures which it could not otherwise have had. This combination of the scholarly and the personal produced a class of commentaries and expositions which, while burdened with the great dogmatic controversies of the times, were singularly direct in method and personal in application. This is seen most markedly in Luther (1483-1546) and Zwingli (1484-1531), the former of whom in his comprehensive commentary on Galatians, and the latter in his fragmentary expositions of Matthew and Acts and some of the Epistles, made the basis of their work the literal sense of Scripture and its value for the individual religious life. These characteristics are evident also in Melancthon's (1497-1560) *Expositions* (Romans, 1522; John, 1523; Colossians, 1527; Gospels generally, 1544), the feature in which is not so much the classical learning of this remarkable scholar, who for two centuries exerted such a commanding influence on German education, as the rational method used and the ethical emphasis given to the truth. And even in the great commentaries (covering all the New Testament excepting the Apocalypse) of

Calvin (1509-64), who was preëminently the theologian of the Reformation, this scientific method and this practical element are persistently in evidence. Yet with all the commentators and expositors of this period, the very emphasizing of the religious purpose of their work, and the centring of the idea with which they worked upon Christ, made inevitable more or less of a return to the old fault of allegorizing; though as between Lutheran and Reformed scholars it was the former who fell more frequently into this error, and the latter who developed more consistently the grammatico-historical principles of interpretation with which humanism had endowed the Reformation. These different tendencies are seen, on the one side, in the New Testament work produced by the following Lutheran exegetes: Strigel (died 1569), Brenz (died 1570), Camerarius (died 1574), Flacius Illyricus (died 1575), Chemnitz (died 1586), Cruciger (died 1597), and Chytræus (died 1600); and, on the other side, in the New Testament work of the following Reformed expositors: Pellicanus (died 1556), Meusel (died 1503), Bullinger (died 1575), and Beza (died 1605).

Humanism as a movement was too deep and profound in character and too widespread in extent not to have its influence within the Catholic as well as the Protestant church, and this influence had its bearing too directly upon the study of the Scriptures not to affect significantly the course of this church's exegesis. The evidence of this is manifest in the period of the Counter-Reformation, and especially at its beginning. Cajetan (1469-1534), on the threshold of the period, was liberal as a commentator. He treated most of the New Testament books, including the Apocalypse, and did not hesitate to differ in his interpretations from schoolmen and fathers alike, while he wholly abandoned their allegorizing manner of work. With him stood Sodaletus (died 1547), whose scholarly method in his commentary on Romans (1535) brought him to such vigorous views of doctrinal truth as were possible with loyalty to the church, and Maldonatus (died 1583), one of the most brilliant lecturers on exegesis since Abélard's day, whose commentary on the Four Gospels (first published in 1596) shows not only a large freedom from the fathers, but a marked ability in the explanation of the literal sense of Scripture. To these might be added, even in the later years of the period, Estius (died 1613), Mariana (died 1624), and Menochius (died 1655). As the period progressed, however, the doctrinal definitions and elucidations of the Council of Trent led to stricter methods. This is seen particularly in the Jesuit scholars Bellarmine (died 1621), who after approved scholastic manner made the Scriptures an arsenal for the defense of the Catholic faith; and Cornelius a Lapide (died 1637), who turned to the fathers for his materials; while it evidences itself more or less in Tirin (died 1636), and even in the earlier writers, Emmanuel de Sa (died 1596) and Salmeron (died 1591). Against this dogmatic position the Quietistic movement, first formally introduced by a Spanish priest, Molinos (died 1696), was practically a protest, though its spirit in handling the Scriptures tended rather to vitiate than to vitalize the sounder methods of interpretation. This is marked in the later developments of the movement, as seen in Ques-

nel's (died 1719) *Moral Reflections on the New Testament* (1687), the exegesis of which disclosed an ascetic spirit, and Madame Guyon's (died 1717) explications of the Holy Bible (Paris, 1715), which ran riot in mystical extravaganzas.

A development somewhat similar to this in the Catholic church took place also in the Protestant church. At the beginning of the Reformation the supreme interest in the Scriptures brought them into a place of high regard. As the period progressed, however, this regard grew and intensified until it became at last a reverence that placed the Scriptures in a position of supreme authority for the life and faith of the church. In the same way the spiritual value given to the Scriptures at the first brought them into a place of practical ministry to the church's faith and life. But with the progress of the period this life and faith grew in doctrinal importance, until the ministry which the Scriptures rendered came to be one of support and proof for the church's dogmatic position. The return to allegorizing methods was in reality the threshold of this doctrinal development; but the full growth is seen in the scholastic exegesis of the seventeenth century, especially among the Lutherans. Gerhard (died 1637), in his most important work, *Commentary on the Harmony of the Gospel History of the Passion, Resurrection, and Ascension of Christ* (Jena, 1617), to which he added a completion of the Chemnitz-Leyser harmony, shows almost a pietistic spirit and evidences remarkable patristic learning, yet treats Scripture as throughout the canonically authoritative source for dogma; while Salomo Glass (died 1656), in spite of comprehensive knowledge and grammatical method, burdens his *Philologia Sacra* (Jena, 1623-36) with casuistry and allegorism; and Calovius (died 1686) conceived his chief exegetical work, *Biblia Illustrata* (Frankfort, 1672-76), in the bitterness of a dogmatic polemic, dragging Scripture down to a mere collection of proof texts for Lutheran orthodoxy. Against this dogmatism arose the same protest as in the latter stage of the Counter-Reformation. The first intimation of it appeared in Calixtus (died 1656), who took an irenic position between Lutherans and Reformed, a position based on a lower estimate of Scripture than was current in his day, in which the almost idolatrous reverence for the book was laid aside. This protest came to its full issue in the pietistic school of Spener (died 1705), who in his *Misused Bible Passages* (1693) subordinated the interpreting of Scripture for the sake of the creeds to the study of Scripture for the sake of the religious life. This principle was carried forward and developed by his pupils, Francke (died 1727), in his exegetical lectures at Leipzig (1689) and his various hermeneutical writings, and Anton (died 1730), in his Bible lectures at Halle (from 1695 on) and his occasional writings in the field of the devotional and practical life. In addition to these, Rambach (died 1735) produced in his *Institute of Sacred Hermeneutics* (Halle, 1724) and allied writings the first comprehensive presentation of the hermeneutical discipline, in which, however, the science of the study was endangered by the author's overpressure of the idea of inspiration. Midway between this confessional freedom of the Pietists and the symbol worship of the Lutherans stood Bengel (died

1752), whose *Gnomon of the New Testament* (Tübingen, 1742) is the best exegetical product of the period. He had no extravagant ideas of inspiration and yet was imbued with a profound sense of the religious value of the revelation contained in the words of Scripture; he was conscientious in the details of scholarship and yet comprehensive in the grasp of truth; he was finished in style and yet full of spiritual power.

This dogmatic development and reaction did not show itself so conspicuously among the Reformed exegetes, whether in Germany, Switzerland, or France. The New Testament work done by Paræus (died 1622), J. Cappel (died 1624), Piscator (died 1625), Raphael (died 1715), Lampe (died 1729), and Beausobre (died 1738), while burdened more or less with theological discussion and characterized by theological analysis, is nevertheless devoid of confessional motive and is remarkably true in method. Even in Holland, where the controversy between Arminians and Calvinists was bitter in the extreme, Bible interpretation was not distorted in the interests of party positions. This is evident on the Calvinist side in the exegetical work of Cocceius (died 1689), *Epistles, John's Gospel and Apocalypse*, and in the New Testament printed in his *Opera* (Amsterdam, 1676-78), which was directed against the dry scholasticism of Lutheranism and reinstated in a measure the early Reformation methods, though its excessive typology opened anew the way to the old error of allegorism. It was also evident in the work of his pupils Van Til (died 1713) and Vitringa (died 1722). On the Arminian side it was equally evident in the great interpretative production of Grotius (died 1645), *Annotations on the Old and New Testament*, printed in *Opera* (Amsterdam, 1679), which in its method was free from the control of dogmatic prepossessions, the author's aim being to get at the plain historical sense of Scripture. The further fact that, among Reformed scholars generally, there was produced a class of books called *Observations*, which, while contributing to various phases of Bible study, such as philology, chronology, geography, and natural history, did so along exegetical lines, is clear proof of how scholarly their method was and how free it stood from the slavery of symbolism. Workers in this latter field were Scaliger (died 1609), Casaubon (died 1614), Drusus (died 1616), Bochart (died 1667), and Elsner (died 1750), to whom should be added Wetstein (died 1754), whose critical edition of the New Testament (1751-52) was one of the greatest contributions to biblical scholarship in the century.

In England Lutheran scholasticism, with the accompanying protest against it, did not appear. There were all phases of theological belief, from hyper-Calvinism to Arianism, but Bible study preserved itself from confessionalism. Nothing more practical and devotional—and often nothing more scholarly—exists than the work of the English exegetes of the seventeenth and eighteenth centuries, as Hall (died 1656), Hammond (died 1680), Trapp (died 1669), Lightfoot (died 1675), Poole (died 1679), Pearson (died 1686), Henry (died 1714), Whitby (died 1726), Doddridge (died 1751), Lowman (died 1752), and Gill (died 1771).

Against all the dead scholasticism of German orthodoxy the devotional impulse of pietism was of no permanent avail. Its power

was fully broken only by the deeper-reaching principles of the rationalism represented by such philosophers as Wolff (died 1754) and Lessing (died 1781), and reproduced in the work of such exegetes as Semler (died 1791), Eichhorn (died 1827), and Eckermann (died 1836)—a group of scholars whose New Testament expository work was founded on the idea, not only that the Apostles and Evangelists were influenced by their Jewish surroundings, but that their writings could be properly interpreted only from the viewpoint of these surroundings. The influence of Semler, *Preparation for New Testament Hermeneutics* (Halle, 1760), and his *Commentaries on John's Gospel, Romans, and Corinthians* (Halle, 1770-76), was significant and can be said to have prepared the way for all the later work of New Testament criticism, while in turn their inspiration may be assigned to Baumgarten (died 1767), *Exposition of the Holy Scriptures* (Halle, 1742), and of *Paul's Epistles* (ib., 1749-67), who properly represents the translation from pietism to rationalism. To this group should be added Gabler (died 1826) and Paulus (died 1851), scholars more extreme in their views, whose New Testament commentaries and hermeneutical writings, while marked by learning and critical skill, were thoroughly committed to a naturalistic exegesis and sympathized with the mythical principles of Strauss (died 1874). Fritzsche (died 1846), whose commentaries on *Matthew* (1826), *Mark* (1830), and *Romans* (1836-43) are characterized by great philological ability, alone seems to have been uninfluenced by this rationalism, unless with him might be classed the earlier writer Koppe (died 1791), whose contribution (*Galatians, Ephesians, Thessalonians, and Romans*) to the *Greek New Testament with Annotations*, projected by Heinrichs and Pott, but not completed (Göttingen, 1783-98), is a piece of careful and impartial exegetical work; while Herder (died 1803) shows in his *Explanations of the New Testament* (Riga, 1775), *Letters of Two Brothers of Jesus* (Lemgo, 1775), and *Apocalypse* (London, 1821), a combination of rationalistic and mystical elements that makes him a forerunner of the Schleiermacher school, to which school should be assigned the later scholar De Wette (died 1840), whose *Exegetical Handbook on the New Testament* (Berlin, 1838-48) is remarkable for its religious convictions and its naturalistic results.

Naturally this rationalistic movement aroused orthodoxy to protest; but orthodoxy's dying powers were not equal to anything more than a feeble effort. In fact, the scholarly work of such men as Ernesti (died 1781), *Institutes of the New Testament Interpreter* (Leipzig, 1761) and *Academic Lectures on Hebrews* (ib., 1815); his pupils, Morus (died 1792) and K. A. G. Keil (died 1818); and of J. D. Michaelis (died 1791), *Paraphrase of the New Testament, with Annotations* (Göttingen, 1790-91), all of whom belonged to orthodoxy and sought to defend it, proved silent confessions of the hopelessness of the cause and added rather to the rationalistic impulse. Ernesti's New Testament work, indeed, formed an epoch in hermeneutics by establishing the principle that Scripture has but a single sense—a literal one—and that this sense can be discovered only by the same means as are applicable to an ordinary human book; but this principle, derived really from Wetstein

(died 1754), was in fact more opposed to the mysticism of pietistic interpretation than it was to the realism of rationalistic exposition. It was the foundation of the subsequent school of grammatico-historical exegesis, which was developed more fully by his immediate pupils, Morus and Keil. As a consequence, the later members of this defensive group, J. G. Rosenmüller (died 1815), and especially Kuinoel (died 1841), were more in sympathy with rationalism than they were with orthodoxy.

The defense of the older Tübingen school differed from this weak effort of orthodoxy, inasmuch as its purpose was to support a supernatural Christianity rather than an authoritative confessionalism. Its best representatives in New Testament exegesis are Storr (died 1805), *Commentary on Hebrews* (Tübingen, 1789); his pupil J. F. Flatt (died 1821), *Commentaries* on most of the Epistles (ib., 1825-31), and Hess (died 1828), *Commentary on Acts* (Zurich, 1775) and *Life of Jesus* (ib., 1781). But here, too, the late members of the school—e.g., the younger Bengel (died 1826) and Steudel (died 1837)—became more independent and were allied rather with the naturalism against which they were supposed to stand.

What an orthodox and even a supernaturalistic exegesis were not able in themselves to effect against rationalism, however, was being brought about by the critical philosophy of Kant (died 1804), which in its unconscious emphasis of skepticism destroyed the confidence in reason as the criterion of revelation. The destructive efforts of this philosophy were supplemented constructively by the school of Schleiermacher (died 1834), who, standing in the midst of the rationalistic and evangelical struggle, seemed to partake of both tendencies and yet belonged really to neither. His New Testament exposition, limited in amount (*Commentary on Timothy*, Berlin, 1807; *Hermeneutics*, ed. by Lücke, ib., 1838; *Life of Jesus*, ed. by Ruttenik, ib., 1864), is not the most valuable part of his work; but its influence on subsequent exegesis was pronounced. This is evident in the exegetical writings of Olshausen (died 1839; *Commentary on the New Testament*, continued by Ebrard and Wiesinger, trans., Edinburgh, 1847-49; *A Word on the Deeper Sense of Scripture*, ib., 1824; *The Biblical Exposition of Scripture*, Hamburg, 1825); Neander (died 1850; *Commentary on I. John, Philippians, and James*, trans., New York, 1859; *Life of Jesus*, trans., London, 1848); Lücke (died 1855; *Commentary on the Writings of John*, trans., Edinburgh, 1837; *Elements of New Testament Hermeneutics*, ib., 1816); Rückert (died 1871; *Commentary on Romans*, Leipzig, 1839; *Galatians*, ib., 1833; *Ephesians*, ib., 1834; *Corinthians*, ib., 1836-37); Tholuck (died 1877; *Commentary on Romans*, trans., Edinburgh, 1848; *John's Gospel*, trans., ib., 1836; *Sermon on the Mount*, trans., ib., 1860; *Hebrews*, trans., ib., 1852). It is true that none of these writers exactly represented Schleiermacher's position. They carried out his method of an organic interpretation of Scripture, but they developed it to evangelical degrees which Schleiermacher would not have accepted. This is particularly true of Tholuck, whose commentaries are deeply spiritual in tone and based on a profound conviction of the divine authority of Scripture, though free from any mechanical idea of inspiration.

Yet even the power of this profoundly influential school of exegetes was not sufficient to stop the skeptical impulses started by Kant's philosophy. Even before Schleiermacher's death these had worked themselves out into the systems of Fichte (died 1814) and Hegel (died 1831), the latter of which afterward formed the background for the mythical theory of Strauss (died 1874; *Life of Jesus*, trans., London, 1846) and the critical work of the later Tübingen school of Baur (died 1860; *Paul the Apostle*, trans., London, 1873-75). This school devoted itself to church history and criticism rather than to exegesis. Only the following adherents of Baur can be said to have contributed specifically to New Testament exposition: Volkmar (died 1872; *Commentary on Apocalypse*, Tübingen, 1862; *Romans*, Zurich, 1875); Holsten (died 1897; *Commentary on Galatians*, Rostock, 1859; exposition of *Galatians, Corinthians*, and *Romans*, in his *Gospel of Paul*, i, Berlin, 1880; part ii posthumously, ib., 1898). At the same time, however, it carried out to its results Semler's principle of the emphasis of the historical element in New Testament interpretation, but with such a skeptical attitude of mind towards the New Testament itself as to arouse the definite and distinct opposition, not only of the closer followers of Schleiermacher, but also of a group of exegetes who, while not so profoundly influenced by Schleiermacher's spirit, yet followed in the way of his organic treatment of Scripture. The better representatives of this group are: Winer (died 1858; *Exegetical Studies*, Leipzig, 1827; *Commentary on Galatians*, ib., 1859); Bleek (died 1859; *Commentary on Hebrews*, Berlin, 1828-40; *Lectures on the Apocalypse*, ib., 1862; *Colossians, Ephesians, Philemon*, ib., 1865; *Hebrews*, Elberfeld, 1868; *Synoptical Explanation of the First Three Gospels*, Leipzig, 1862); H. A. W. Meyer (died 1873), editor of the *Critical Exegetical Commentary on the New Testament* (trans., Edinburgh, 1873 et seq.), to which he personally contributed in the first edition *Matthew, Mark, Luke, John, Acts, Romans, Corinthians, Galatians, Ephesians, Colossians, Philemon*, and *Philippians*; Beck (died 1878; *Exposition of Epistles to Timothy, Titus*, Güttersloh, 1879; *Apocalypse*, ib., 1883; *Commentary on Apocalypse*, ib., 1884; *Exposition of Romans*, ib., 1884; *Ephesians*, ib., 1891; *Epistles of Peter*, ib., 1896); Lange (died 1884), editor of the *Commentary on Holy Scripture* (trans., New Testament portion, Edinburgh, 1861-65), to which he personally contributed *Matthew, Mark, John, Romans, James*, and *Apocalypse*; Lechler (died 1890; *Commentary on Acts*, in Lange, Bielefeld, 1860); Ebrard (died 1888; *Commentary on Hebrews*, Königsberg, 1850; *Apocalypse*, ib., 1853; *The First Three Gospels*, trans., Edinburgh, 1853; *Epistles of John*, ib., 1859; *Gospel of John*, ib., 1860); Beyschlag (died 1900; *The Pauline Theodicy*, Berlin, 1869; *The Parables of Jesus*, trans., Edinburgh, 1875; *Commentary on Apocalypse*, ib., 1876; *Commentary on James*, in the last ed. of Meyer, Edinburgh, 1897); B. Weiss (*Commentary on Philippians*, Berlin, 1859; *The New Testament Text Critically Investigated, with Exegetical Notes*, ib., 1894-1900; *Commentaries on Matthew, Mark, Luke, John, Romans, Hebrews*, and *Epistles of John*, in the last ed. of Meyer, 1893-1901); Heinrici (*Commentary on Corinthians*, 1880-87; *Corinthians*, in the last ed. of Meyer, 1896-1900).

Along with this opposition arose a more thor-

oughgoing one in the strictly conservative school of Hengstenberg (died 1869; *Commentary on Apocalypse*, trans., Edinburgh, 1851; *Gospel of John*, trans., ib., 1865), to which more distinctly belonged: Stier (died 1862; *Words of the Lord Jesus*, trans., Edinburgh, 1869; *Apostles*, ib., 1869; *Angels*, London, 1887; *Commentary on Hebrews*, Brunswick, 1862; *James, Epistles of Peter and Jude*, Berlin, 1850); Philippi (died 1882; *Commentary on Romans*, Gütersloh, 1878; *Galatians*, ib., 1884); K. F. Keil (died 1888; *Commentary on Matthew*, Leipzig, 1877; *Mark and Luke*, ib., 1879; *John*, ib., 1881; *Peter and Jude*, ib., 1883; *Hebrews*, ib., 1885). To these should be added the following later writers, belonging to the same general conservative attitude, though varying among themselves as to their degree of conservatism: Franz Delitzsch (died 1890), whose chief New Testament work was a *Commentary on Hebrews* (trans., Edinburgh, 1868-70); Luthardt (*Commentary on John's Gospel*, Nuremberg, 1852-53; *Apocalypse*, Leipzig, 1861; *Commentary on John's Gospel and Acts*, with Zückler, trans., Edinburgh, 1878-79; *John's Epistles and Romans*, in Strack and Zückler, Munich, 1886-88); Nösgen (*Commentary on Acts*, Leipzig, 1882; *Commentary on Matthew, Mark, and Luke*, in Strack and Zückler, Munich, 1886-88); Zückler, editor with Strack of the *Concise Commentary on the Holy Writings of the Old and New Testaments* (Munich, 1886-88), to which he personally contributed *John's Gospel and Acts* (with Luthardt), *The Pastoral Epistles*, *Hebrews and Apocalypse* (with Riggenbach), *Thessalonians and Galatians* in the last edition (Munich, 1894-98). Apart from all schools, occupying an unaffiliated and isolated position, yet bitterly hostile to the Tübingen school, is to be placed Ewald (died 1875; *Commentary on the Apocalypse*, Leipzig, 1828; *Exposition of the First Three Gospels*, Göttingen, 1850).

In this struggle the followers of Baur were not able to maintain their critical position, but abandoned several points regarded as of importance, suffering their greatest defeat in the defection from their ranks of Ritschl (died 1889), who, in the second edition of his *Old Catholic Church* (Bonn, 1857), undertook to show that the historical premises on which the exegesis of the school was founded were false. While the change in position on the part of such eminent disciples of Baur as Holtzmann (died 1910), Hilgenfeld (died 1907), and Pfeiderer (died 1908) did not radically affect their approach to the problems of exegesis, and those influenced by Ritschl did not accept all of his conclusions on isagogical questions, the general effect was the rise of a school of exegesis characterized by a strict historico-critical method, but also by an increased emphasis on the religious evaluation reminding of the attitude of Schleiermacher. This school, though differing from many of Baur's conclusions and conscious of his limitations, yet recognizes his great services and quite agrees with Jülicher that "he has taught us to appreciate the books of the New Testament in a truly historical way, as products of the spirit of Christianity at a definite time and as witnesses for it." It has gained great influence and may be said to control the New Testament interpretation of to-day. The more prominent exegetes in recent years have been: H. J. Holtzmann, editor of the *Hand Commentary to the New Testament* (Freiburg, 1889-91), to which

he contributed personally in the first edition *Matthew, Mark, Luke, John's Gospel and Epistles, the Apocalypse, and Acts*; Lipsius (died 1892; *Commentary on Romans, Galatians, Philippians*, 1st ed. of Holtzmann, ib., 1891); Schmiedel (*Commentary on Corinthians and Thessalonians*, 1st ed. of Holtzmann, ib., 1890); Von Soden (*Commentary on Ephesians, Colossians, Philemon, Timothy, Titus, Hebrews, James, Peter, and Jude*, 1st ed. of Holtzmann, ib., 1891); Wendt (*Acts*, 9th ed. of Meyer, Göttingen, 1913); B. Weiss (*Matthaei*, 10th ed. of Meyer, ib., 1910; *Mark and Luke*, 9th ed., ib., 1901; *John*, 9th ed., ib., 1902; *Romans*, 9th ed., ib., 1899; *Timothy and Titus*, 7th ed., ib., 1902; *Hebrews*, 6th ed., ib., 1897; *Johannine Epistles*, 6th ed., ib., 1900); J. Weiss (*I Corinthians*, 9th ed. of Meyer, ib., 1910; *The Apocalypse*, ib., 1904; ed. of *Schriften des N. T.*, 1906 ff.); E. Haupt (*The Captivity Epistles of Paul*, 8th ed. of Meyer, ib., 1902); Heinrici (*II Corinthians*, 8th ed. of Meyer, ib., 1900); Bousset (*The Apocalypse of John*, 6th ed. of Meyer, ib., 1906); Dobschütz (*Thessalonians*, 7th ed. of Meyer, ib., 1909); Beyschlag (*James*, 6th ed. of Meyer, ib., 1908); Knopf (*Peter and Jude*, 7th ed. of Meyer, ib., 1912); Sieffert (*Galatians*, 9th ed. of Meyer, ib., 1899). A more conservative standpoint is occupied by Theodor Zahn, who, in addition to his learned investigations as to the Canon and his *Introduction to the New Testament* (Leipzig, 1900), has recently begun the publication of a series of Commentaries to which he has himself contributed one on *Luke* (ib., 1913), and Riggenbach one on *Hebrews* (ib., 1913). Valuable contributions were made by Hilgenfeld, who for half a century published the *Zeitschrift für Wissenschaftliche Theologie*; by Pfeiderer, through his work *Das Urchristentum* (2d ed., Berlin, 1902); by Harnack, whose *Beiträge zur Einleitung in das Neue Testament* (Leipzig, 1906-12) has furthered especially the interpretation of the synoptic Gospels and Acts; by Hans Lietzmann, editor of a *Handbook to the New Testament* (Tübingen, 1906 ff.), of which three volumes were out in 1914; by Adalbert Merx (died 1909), whose commentaries on the Sinaitic Syriac of *Matthew* (Berlin, 1902), *Mark and Luke* (ib., 1905), and *John* (posthumously, ib., 1912) are unique in their mastery of the early versions; and by Julius Wellhausen, whose *Introduction to the Three First Gospels* (Berlin 1905) and commentaries on *Mark* (ib., 1903), *Matthew* (ib., 1904), *Luke* (ib., 1904), and *John* (ib., 1908) have stimulated research in these fields. The last great edition of the text by Von Soden was completed in 1913, under the title *Die Schriften des Neuen Testaments in ihrer ältesten erreichbaren Textgestalt* (Göttingen, 1913).

In France Renan (died 1892) interpreted the life of Jesus (*Vie de Jésus*, Paris, 1863) and the history of the early Church (*Histoire des origines du christianisme*, ib., 1886); Albert Réville (died 1906) published his studies of the New Testament in *Essais critiques sur St. Matthieu* (ib., 1860), *Origines du Nouveau Testament* (ib., 1884), and *Jésus Christ* (2d ed., ib., 1906); his son, Jean Réville (died 1908), occupied himself especially with John (*La doctrine du Logos*, ib., 1881; *Le quatrième évangile* 2d ed., ib., 1902); the conservative scholar F. Godet published commentaries on *Luke* (trans., Edinburgh, 1875), *John* (trans., ib., 1879-80),

Romans (trans., ib., 1880), and *I Corinthians* (trans., ib., 1886); and the modernist Alfred Loisy has written *Histoire du canon du Nouveau Testament* (ib., 1891), *L'Évangile et l'Église* (ib., 1902), *Études évangéliques* (ib., 1902), *Le quatrième évangile* (ib., 1903), *Les évangiles synoptiques* (ib., 1908). In Holland conservative exegesis was represented by Van Oosterzee (died 1882) in his *Commentary on Luke* (trans., Edinburgh, 1863), the *Pastoral Epistles*, and, with Lange, *James* (ib., 1858-62). The "founder of the Leyden School," J. H. Scholten (died 1885), published an Introduction (2d ed., Leyden, 1856), *Het evangelie naar Johannes* (ib., 1864), *Het oudste evangelie* (ib., 1864), *Het Paulinisch evangelie* (2d ed., ib., 1873). W. C. Van Manen (died 1905) occupied a more radical standpoint in his *Handleiding voor de oudchristelijke letterkunde* (ib., 1900), *Paulus* (ib., 1890-96), and in *Encyclopaedia Biblica*; and J. M. S. Baljon (died 1908) made valuable contributions in his *Inleiding der boeken des N. T.* (Utrecht, 1903), *Grieksch-theologisch woordenboek* (ib., 1895-99), and *Geschiedenis van de boeken des N. T.* (ib., 1901) and his commentaries on *Matthew* (Groningen, 1900), *John* (Utrecht, 1902), *Acts* (ib., 1903), and the *Catholic Epistles and Philippians* (ib., 1904).

The New Testament exegesis produced in Great Britain and America during the earlier part of the nineteenth century was not noticeably affected by the English deism which closed the century preceding, nor to any degree by the various rationalistic movements which so profoundly influenced the exegesis of Germany. In Great Britain such writers as Scott (died 1821; *Family Bible*, London, 1796-1825) and Adam Clarke (died 1832; *Commentary on the Holy Bible*, ib., 1810-20) continued the popular work of Henry, Doddridge, and Gill, but with better critical results. Scholars like Alford (died 1871; *The Greek New Testament with Commentary*, London, 1849-61), Ellicott (*Commentary on Galatians*, Cambridge, 1854; *Ephesians*, ib., 1855; the *Pastorals*, ib., 1856; *Philippians, Colossians, Philemon*, ib., 1857; *Thessalonians*, ib., 1858; *I Corinthians*, London, 1887), J. B. Lightfoot (died 1889; *Commentary on Galatians*, London, 1865; *Philippians*, ib., 1868; *Colossians, Philemon*, ib., 1875; *Notes on Paul's Epistles*, ib., 1895), Westcott (died 1901; *Commentary on John's Epistles*, ib., 1883; *Hebrews*, ib., 1889; *John's Gospel*, ib., 1892), Eadie (died 1876; *Commentary on Colossians*, ib., 1856; *Philippians*, ib., 1859; *Ephesians*, ib., 1861; *Galatians*, ib., 1869; *Thessalonians*, ib., 1877), Plumptre (died 1891; *Commentary on Acts*, Cambridge, 1879; *Mark*, ib., 1879; *II Corinthians*, ib., 1883), and MacPherson (*Commentary on Ephesians*, Edinburgh, 1892), produced works of permanent value, though generally conservative in their attitude. Stanley (died 1881; *Commentary on Corinthians*, London, 1862) and Jowett (died 1893; *Commentary on Galatians, Romans, Thessalonians*, ib., 1859) represent a freer tendency. In America New Testament exegesis was perhaps more conservative, though, with noted exceptions, not so remarkable for scholarship. Its best representatives were: Moses Stuart (died 1852; *Commentary on Hebrews*, Andover, 1827-28; *Romans*, ib., 1832; *Apocalypse*, ib., 1845; *Principles of Interpretation*, from the Latin of Ernesti, ib., 1842); J. A. Alexander (died 1860; *Commentary on Acts*, New York, 1856; *Mark*, ib., 1858; *Matthew*, ib.,

1860); Hackett (died 1875; *Commentary on Acts*, Boston, 1851; *Philemon*, New York, 1860); C. Hodge (died 1878; *Commentary on Romans*, Philadelphia, 1835; *Ephesians*, New York, 1856; *Corinthians*, ib., 1857-59); Cowles (died 1881; *Notes on the Old and New Testaments*, New York, 1867-81); Conant (*Annotated Version of Matthew*, ib., 1860; *Revised Version of the New Testament, with Notes*, ib., 1866); Broadus (died 1895; *Commentary on Matthew*, Philadelphia, 1886); Hovey, editor of the *American Commentary on the New Testament* (ib., 1887-90), to which he personally contributed *John's Gospel and Galatians* (1890).

The growing needs of Sunday-school work produced in America a class of popular exegetical works for the use of teachers and older scholars in the school, such as Barnes's (died 1870) *Notes on the New Testament* (New York, 1832-52); Jacobus' (died 1876) *Notes on the Gospels* (ib., 1848-56) and *Acts* (ib., 1859). At the present time in Great Britain these needs are met by such series as the *Handbooks for Bible Classes and Private Students*, ed. by Marcus Dods and Alexander Whyte (London, 1879-85); *The Cambridge Bible for Schools and Colleges*, ed. by J. J. S. Perowne (ib., 1878-1901); also, by the same editor, *The Cambridge Greek Testament for Schools and Colleges* (ib., 1881-91). In America F. N. Peloubet has produced since 1875 a series of compilative *Notes on the Sunday School Lessons*. In the same popular line, though for more general use, are: In Great Britain, *The Pulpit Commentary* (London, 1880 et seq.), ed. by Canon Spence and J. S. Exell; *The Library Commentary*, by Jameson, Fausset, and Brown (ib., 1871); *Commentary for English Readers* (ib., 1877-79), by Bishop Ellicott; *Biblical Museum* (ib., 1871-81), ed. by J. C. Gray; *The Expositor's Bible* (ib., 1888 et seq.), ed. by W. Robertson Nicoll. In America: *Commentary on the Old and New Testaments* (New York, 1874-86), ed. by D. D. Whedon; *Bible Work* (ib., 1887 et seq.), by J. G. Butler. For more advanced scholarly use is *The Holy Bible (Speaker's Commentary)*, London, 1871-82, ed. by Canon Cook (died 1889). In the latter part of the nineteenth century and the beginning of the twentieth the influence of the historico-critical school in Germany was more distinctly felt in England and America. In the front rank of critical and exegetical scholarship of the present time stands *The International Critical Commentary* (New York, 1895 et seq.). The New Testament books so far produced are: *Mark*, by E. P. Gould (died 1902); *Luke*, by Alfred Plummer; *Romans*, by William Sanday; *Philippians and Philemon*, by Marvin R. Vincent; *Ephesians and Colossians*, by T. K. Abbott; *Peter and Jude*, by Charles Bigg; *I Corinthians*, by Robertson and A. Plummer; *Matthew*, by Allen; *I-II Thessalonians*, by Frane; the *Johannine Epistles*, by Brooke. With this may be ranked, in a way, the more concise but none the less scholarly reworking of Alford's *Greek Testament*, under the title *The Expositor's Greek Testament* (London, 1897 et seq.; New York, 1900), ed. by W. Robertson Nicoll. More radical are the commentaries in the *International Handbooks to the New Testament* (London, 1900 et seq.), ed. by Orello Cone. The modern critical standpoint is also maintained in the *Bible for Home and School* (New York, 1908-13), in which *Matthew* is by Robertson (1911), *Acts* by Gilbert (1908), *Colossians and Ephesians* by Alexander (1910),

Galatians by Bacon (1909), and *Hebrews* by Goodspeed (1908). Benjamin W. Bacon in America and James Moffatt in England have dealt especially with isagogical questions, and made many valuable contributions. The co-operation of Semitic scholarship in the interpretation of the Gospels is exemplified in *The Prophet of Nazareth* (New York, 1905; 2d ed., 1907), by Nathaniel Schmidt; and the participation of Jewish scholars in this work by *The Synoptic Gospels* (London, 1909 et seq.), by Claude C. Montefiore.

Bibliography. OLD TESTAMENT INTRODUCTIONS: Richard Simon (Paris, 1678; 2d ed., Rotterdam, 1685); Carpзов (Leipzig, 1714-21); Semler (Halle, 1773); Eichhorn (Leipzig, 1780-83; 4th ed., 1823); J. D. Michaelis (Hamburg, 1787); Jahn (Vienna, 1793; 2d ed., 1802-03); Augusti (Leipzig, 1806); De Wette (Berlin, 1817; 7th ed., 1852; 8th ed. by Schrader, 1869); Hug (Stuttgart, 1808; 4th ed., 1847); Bertholdt (Erlangen, 1812-19); Hävernick (ib., 1835; 2d ed., 1854); Horne (London, 1818; 9th ed., 1846); Glaire (Paris, 1830 ff.); Herbst-Weite (Freiburg, 1840-44); Hupfeld (Halle, 1850); Keil (Frankfort, 1855; 3d ed., 1873); Bleek (Berlin, 1860; 3d ed. by Kamphausen, ib., 1870; 4th ed. by Wellhausen, 1878; also 6th ed., 1893); Kuenen (Leyden, 1861-65; 2d ed., 1887; of part iii by Matthes, 1893); Davidson (London, 1862); Lamy (Mechlin, 1866-68); Fürst (Leipzig, 1867-70); Kaulen (Freiburg, 1876 ff.; 4th ed., 1912); Ubaldi (Rome, 1877-81); Strack (Nördlingen, 1882; 6th ed., 1906); Reuss (Brunswick, 1881, 1890); Robertson Smith (Edinburgh, 1881; 2d ed., 1892); Vatke (ed. by Preiss, Bonn, 1886); Riehm (ed. by Brandt, Leipzig, 1889); Driver (Edinburgh, 1891; 9th ed., 1910); Cornill (Freiburg, 1891; 8th ed., 1914); König (Bonn, 1893); Wildeboer (Groningen, 1893); Cornely (Paris, 1894-97); Briggs (New York, 1899); Baudissin (Leipzig, 1901); Budde (ib., 1906); Gautier (Lausanne, 1906); Bennett and Adeney (London, 1908); Sellin (Leipzig, 1911, 1914); Fowler (Boston, 1913); G. F. Moore (New York, 1913).

NEW TESTAMENT INTRODUCTIONS: Richard Simon (Rotterdam, 1689); Semler (Halle, 1767); J. D. Michaelis (Göttingen, 1788); Eichhorn (Leipzig, 1804-14; 3d ed., 1827); J. E. C. Schmidt (Giessen, 1804-05); Hug (Freiburg, 1808; 4th ed., 1847); Bertholdt (Erlangen, 1812-19); De Wette (Berlin, 1826; 5th ed., 1848); Horne (London, 1818; 10th ed. by Tregelles, 1856); Credner (Halle, 1836); Reuss (Brunswick, 1842; 6th ed., 1887); Scholz (Cologne, 1845); Scholten (Leyden, 1856); Bleek (Berlin, 1862; 3d ed., 1875, ib., by Mangold, and also 4th, 1886); Davidson (London, 1868; 3d ed., 1894); Hilgenfeld (Halle, 1875); Kaulen (Freiburg, 1876; 4th ed., 1912); Salmon (London, 1885; 8th ed., 1897); Holtzmann (Freiburg, 1885; 3d ed., 1892); B. Weiss (Berlin, 1886; 3d ed., 1897); Rovers (Leyden, 1888); Cornely (Paris, 1894-97); Zahn (Leipzig, 1897, 1900); Bacon (New York, 1900); Jülicher (Leipzig, 1894; 6th ed., 1906); Godet (Neuchâtel, 1893); Baljon (Utrecht, 1901); Belsler (Freiburg, 1902); Jacquier (Paris, 1903-08); Von Soden (Berlin, 1905); Wrede (Leipzig, 1907); Barth (Berlin, 1908); Gregory (Leipzig, 1909); Peake (London, 1909); Moffatt (New York, 1911); Feine (Leipzig, 1913). Other works: Hody, *De Bibliorum Testibus* (Oxford, 1705); Wolf, *Bibliotheca Hebraica* (Jena, 1715-

33), continued by Köcher as *Nova Bibliotheca Hebraica* (ib., 1783-84); Rosenmüller, *Historia Interpretationis Librorum Sacrorum* (Hildburghausen, 1795-1814); Geiger, *Urschrift und Uebersetzungen* (Breslau, 1857); Fürst, *Bibliotheca Judaica* (Leipzig, 1863); Diestel, *Geschichte des Alten Testaments in der christlichen Kirche* (Jena, 1869); Farrar, *The History of Interpretation* (London, 1886); Zückler, *Handbuch der theologischen Wissenschaften* (Nördlingen, 1890); Ginsburg, *Introduction to the Massoretic Critical Edition of the Hebrew Bible* (London, 1897); Swete, *An Introduction to the Old Testament in Greek* (ib., 1900); Nestle, *Einführung in das griechische Neue Testament* (Leipzig, 1897, 1909); Pfeiderer, *Das Urchristentum* (Berlin, 1886, 1902); Bertholet and A. Meyer, art. "Bibelwissenschaft," in *Die Religion in Geschichte und Gegenwart* (Tübingen, 1909).

EXELMANS, ag'zél'máns, RÉMY JOSEPH ISIDORE, COMTE (1775-1852). A marshal of France. He was born at Bar-le-Duc, in the Department of Meuse, and entered the army in 1791. He was promoted to the rank of captain in 1799, served with distinction in the campaign in Naples under Macdonald and Championnet, and in 1801 was attached as aid-de-camp to the staff of Murat. In 1808, while with Murat in Spain, he was captured and sent to England, where he remained a prisoner for three years. Escaping, he rejoined Murat, who had become King of Naples and who established him at his court. But he left Italy to serve with Napoleon in the Russian campaign in 1812. For his brilliant conduct the Emperor created him general of division and grand officer of the Legion of Honor. He was active in the Dutch campaign of 1814, and after Elba Napoleon named him a peer of France. Under the régime of the Restoration after the fall of Napoleon in 1815, attempts were made to win him to the Bourbon side, but his negotiations with Murat resulted in his exile from France. He was permitted to return after several years, and in 1831 Louis Philippe restored him to the Chamber of Peers, and under the presidency of Louis Napoleon he was made Grand Chancellor of the Legion of Honor and marshal of France.

EXEMPTION (Lat. *exemptio*, from *eximere*, to take out, from *ex*, out + *emere*, to take, buy). The legal right to be excused from rendering certain services to the state, or to receive or retain certain property free from the claims of others. It is secured by a variety of statutes (popularly called exemption laws). Some of these designate the persons or classes who are not liable to jury duty or to military service. Others specify the portion of a decedent's estate which is to be set apart for the use and benefit of the widow and children, and which they are allowed to retain even in preference to the creditors of the deceased. Still others describe the property of a tenant which is free from distress for rent, or the property which is free from taxation, or from seizure under execution, or which may be retained by a bankrupt free from liability for his debts.

These statutes differ greatly in detail, but all have the common object of saving the family of a debtor from penury. The articles most generally exempted are necessary household furniture, tools used in a trade, a team, certain domestic animals, and a limited quantity of food supplies for the debtor's family. In some of our States the tendency is to increase exemptions

unduly; but in all the courts are agreed that the policy of exemption is humane and wise, and that exemption laws should be very liberally construed. Certain laws protect a debtor and his family against an improvident attempt on his part to waive the benefit of the statute. For the particular exemption laws of any State, consult the statutes of that State, or Hubbell, *Legal Directory for Lawyers and Business Men* (New York, annually). See HOMESTEAD.

EXERCISE (Lat. *exercitium*, exercise, from *ex*creare, to exercise, from *ex*, out + *arcere*, to ward off). An important element in the preservation of health and the prevention and cure of disease. The physiological effects of exercise when taken in proper therapeutic quantities are increased excretory activity, together with a correspondingly increased demand for oxygen and food. Cellular destruction and rebuilding—katabolism and anabolism—are stimulated. The immediate phenomena of general muscular exercise are increase in the respiratory movements, in the heart action, and in the production of sweat. Appetite is stimulated, sleep promoted, and nervous equilibrium preserved. Authorities are agreed that regular exercise strengthens the defensive powers of the body against disease; i.e., a certain degree of immunity is conferred. Outdoor exercise, particularly when connected with some form of game, such as golf or tennis, which engrosses the mental faculties, is most beneficial. In the treatment of diseases exercise has to be definitely prescribed. In the treatment of chronic heart disease from general obesity or fatty degeneration, it has been reduced to a system. Hypertrophy of the heart from gout, and chronic valvular disease, especially when symptoms of dropsy, renal disturbance, bronchial congestion, or catarrh are present, are markedly improved by specified exercises taken under careful direction. Other conditions which are benefited are chronic bronchitis, atonic dyspepsia, hepatic congestion, constipation, and anemia. In certain cases of excessive weakness, advanced cardiac or kidney disease and obesity, passive exercise must be relied upon for a time at least. Passive movements are also largely employed to relax stiffened joints, restore paralyzed muscles, and correct deformity. A series of ingenious and highly complex machines have been invented for this purpose. In other cases massage, electricity, and resistance exercises are indicated. All of these must be carefully adopted to meet the conditions present. When indulged in to excess, exercise is capable of producing serious harm. Among the commonly observed injurious effects are muscular hypertrophy, succeeded by dilatation, of the heart, arteriosclerosis, hernia, etc. Overexercise is dangerous in such conditions as endocarditis, myocarditis, tuberculosis of the lungs and joints, chronic bronchitis, varicose veins, chronic appendicitis, chronic nephritis, and flat foot. In women uterine displacement is sometimes made worse. In all cases exercise must be carefully prescribed and at times interdicted altogether. For the forms and methods of exercise, see GYMNASIICS; PHYSICAL TRAINING. Consult chapters on exercise in Hare's *Modern Treatment*, vol. i (New York, 1910).

EXETER. A city and a county and parliamentary borough and river port, geographically in the County of Devon, England, on the Exe, 10 miles northwest of its mouth, 172 miles west-

southwest of London, and 73 miles southwest of Bristol (Map: England, C 6). It is the county town of Devonshire. Exeter is a quaint old town, picturesquely situated on a broad ridge of land amid hills. Its principal edifice is the cathedral, begun in 1100 and famed for the beauty of its design and the richness of its decorations. Its distinguishing external features are the two transeptal towers, a unique conception of English cathedrals, dating from the early part of the twelfth century, and the beautifully ornamented west front added in the fourteenth century. The dimensions are 408 feet in length by 140 feet across the transepts. The interior is notable for its fine proportions and perfect symmetry. Its special features are the long, unbroken roof, carved minstrels' gallery, the bishop's throne with a lofty spirallike canopy, the sculptured stone choir screen, and the modern reredos. The architectural symmetry and decorative harmony of the church are perhaps unsurpassed in England. The chapter house, with a magnificent ceiling, contains a fine library, and among many valuable ancient manuscripts is Leofric's celebrated book of Saxon poetry. In the cathedral close are the episcopal palace and deanery.

High Street contains many ancient buildings, the finest being the Guildhall, whose upper story projects over the sidewalk and forms an arcade supported by pillars. On an eminence near one of the railway stations are the ruins of Rougemont Castle, built by William the Conqueror, and remains of the ancient city walls. Part of the castle grounds now constitutes Northernhay Park. Among other buildings are St. John's Hospital, founded in the reign of Henry III, the Albert Memorial Museum, opened in 1868, the Victoria Hall, lunatic asylum, and almshouses. Exeter owns its water supply and an electric plant. It maintains a technical college, public library and museum, public baths and wash-houses, parks, an asylum, markets, a septic tank system of sewage treatment, and a cemetery. It sends one member to Parliament. Exeter has a large floating basin accessible to vessels of 350 tons, a canal extending to Toppsham, accessible to vessels of 14-foot draft, and extensive rock-hewn wine vaults bordering its quay. It carries on a considerable shipping trade. Exeter has unsurpassed nurseries and exports dairy, farm, and orchard produce. Its manufactures include gloves, agricultural implements, beer, paper, and iron goods. It is the chief market for the celebrated Honiton lace. Exeter is on the Great Western and the London and South Western railways. The city embraces 3166 acres; pop., 1801, 45,760; 1901, 47,185; 1911, 48,664 (the increase in each decade being 3.1 per cent). The civil parish of St. Thomas the Apostle, on the right bank of the Exe, is a part of Exeter. Its area is 1270 acres; pop., 1901, 9457; 1911, 11,381.

In early times Exeter, the *Ocer Iso* of the Britons, was most probably an important centre of trade with the Greeks and the Phœnicians. To the Romans it was known as *Iseca Damnoniorum*. Exeter was for a long time the centre of British resistance to the Anglo-Saxon invaders, and in 926, when Athelstan visited Exanceaster, he found it inhabited by British and Saxons alike. Athelstan surrounded the town with walls, so that it withstood an attack of the Danes in 1001. Two years later, however, they returned and plundered the town. In 1050

Exeter, as affording greater security, replaced Crediton as the episcopal see of Devonshire. The city was taken by the Conqueror in 1068 and by Stephen in 1137. During the Middle Ages it had a very important woolen trade, but later lost it. During the Civil Wars it was held by the Royalists from 1643 to 1646, when it surrendered to Fairfax. Consult: Oliver, *The History of the City of Exeter* (Exeter, 1821); id., *Lives of the Bishops of Exeter and History of the Cathedral* (London, 1861-81); Freeman, *History of Exeter* (ib., 1890); Prideaux and Shafto, *Bosses and Corbels of Exeter Cathedral* (ib., 1910).

EXETER. A town and one of the county seats of Rockingham Co., N. H., 25 miles (direct) east of Manchester, on the Squamscott River, and on the Boston and Maine Railroad (Map: New Hampshire, J 8). One of the oldest towns in the State, Exeter contains a large number of Colonial houses, a public library, and a hospital. The Phillips Exeter Academy (q.v.) and the Robinson Female Seminary are situated here. The river affords good water power, which is utilized in cotton manufacturing. Other important products are iron and brass goods, machinery, boxes, umbrellas, automobile tubes, asbestos and rubber novelties, casings, and shoes. The town was founded in 1638 by Rev. John Wheelwright, banished from Massachusetts, and was under the jurisdiction of Massachusetts from 1645 to 1680. During the Revolution it was the seat of the New Hampshire government. Pop., 1900, 4922; 1910, 4897. Consult Bell, *History of the Town of Exeter* (Exeter, 1888).

EXETER. A borough in Luzerne Co., Pa., about 10 miles west of Scranton, on the Lehigh Valley Railroad (Map: Pennsylvania, K 3). Points of interest in the vicinity are Fort Wintermooth and Scovill and Wintermooth islands, in the Susquehanna River. The borough is in a fertile agricultural and timber region, and coal mining is carried on. Pop., 1900, 1948; 1910, 3537.

EXETER BOOK, or **CODEx EXONIENSIS**. The name given to a manuscript anthology of Old English, or Anglo-Saxon, poetry, in possession of Exeter Cathedral. The volume has been identified with a book presented to the cathedral by Leofric, the first Bishop of Exeter (1050-72), and described as "One great English book on various topics, composed in verse." The manuscript, $55\frac{1}{2} \times 7\frac{1}{2}$ inches, contains 123 leaves, or 246 pages, and is written on vellum. But for this volume, some of the finest Old English poems, as the *Christ*, would be lost to us. Consult: Gollancz, *The Exeter Book*, containing both the original text and a translation (London, 1895); the excellent account of the book and of Leofric in the introduction by Cook to Cynewulf's *Christ* (Boston, 1900); *Riddles of the Exeter Book*, ed. by F. Tupper, Jr. (New York, 1910); *Old English Riddles*, ed. by A. J. Wyatt (ib., 1912). See **VEROCELLI BOOK**.

EXETER COLLEGE. A college of Oxford University. It was founded about 1314 by Walter de Stapeldon, Bishop of Exeter, for a rector, 12 scholars from the diocese of Exeter, holding degrees in arts, and a scholar chaplain. The foundation was a self-governing corporation, whose revenues, however, according to a somewhat frequent mediæval custom, were vested in another corporation, the dean and chapter of Exeter. Another curious provision was the annual election of the rector. The scholars first

occupied two hostels, Hart Hall and Arthur Hall, and the establishment seems to have been called, from its founder, Stapeldon Hall. In 1565 Sir William Petre obtained a new charter for the foundation from Queen Elizabeth and completely reorganized it, on the model of other Oxford colleges. The scholars were removed to buildings on the present site of the college, the rector was made a permanent official, and the name was changed to Exeter College. Scholarships were added by Petre and others, among whom in later years Charles I was one, and the institution took on a new lease of life. The organization of the college was materially changed by the general readjustments in the university and colleges of recent years. New buildings have been added to the already picturesque quadrangle. Of these the chapel is especially noteworthy. It was designed by Scott and has, as part of its interior decoration, a piece of splendid tapestry, designed by Burne-Jones and executed by William Morris. Of the older buildings, the hall is one of the most notable in the university. Among the distinguished men who have been connected with the college are Archbishops Secker and Marsh; Bishops Conybeare, Bull, Mackarness, Prideaux, and Hall; Anthony Ashley Cooper, first Earl of Shaftesbury; John Ford the dramatist; Sir J. T. Coleridge, Lord Coleridge; J. A. Froude the historian; Burne-Jones, William Morris, F. D. Maurice, and Sir Charles Lyell. There were in the college, in 1913, 9 fellows, 8 honorary fellows, 50 scholars and exhibitioners, and a total of 212 undergraduates. Consult W. K. Stride, *Exeter College* (London, 1900).

EXETER, or EX'ON, DOMESDAY. See **DOMESDAY BOOK**.

EXETER HALL. A large building, formerly standing on the north side of the Strand, London, 131 feet long, 76 feet wide, and 45 feet high. It was built in 1831 for the use of religious and charitable societies and in 1880 purchased for the Young Men's Christian Association and used by that organization, and also leased for the May meetings of certain religious societies and for various musical organizations, the hall having a seating capacity of 5000. Often used by the dissenting bodies, by anti-slavery reformers, and by total-abstinence societies for great public meetings, "Exeter Hall" became a term to denote fanatical zeal, or the sort of moral earnestness regarded by conservative or conventional people as "bad form." In 1908 it was sold and demolished.

EXHAUSTIONS (from Lat. *exaurire*, to exhaust, from *ea*, out + *aurire*, to draw), **METHOD OF.** A mode of proving certain mathematical propositions, variously attributed to Antiphon and Bryson, Hippocrates and Eudoxus. The formal statement of this method may be found in Euclid, xii, 2. A familiar example is that of determining the area of a circle by means of the areas of circumscribed and inscribed polygons. The area of the circle lies between the areas of the polygons, and the latter approach indefinitely near it as the number of sides of the polygons is indefinitely increased. Archimedes used this plan in determining that π lies between $3\frac{1}{4}$ and $3\frac{1}{2}$. However, the idea of a circle being a polygon of an infinite number of sides is an essentially modern one, due chiefly to Kepler, and marks the passage of the method of exhaustions into the modern infinitesimal method. (See **CALCULUS**.) Consult: Chasles,

Aperçu historique (3d ed., Paris, 1889); Heath, *The Thirteen Books of Euclid's Elements* (3 vols., Cambridge, 1908); Gow, *History of Greek Mathematics* (Cambridge, 1884).

EXHIBITIONS (Lat. *exhibitio*, from *exhibere*, exhibit, from *ex*, out + *habere*, to have), **ARCHITECTURE** OF. The great international exhibitions, or world's fairs, have given rise to some of the most interesting and important developments of modern architecture along two divergent lines. The first exemplifies the effort towards a free, original, and logical expression in architectural form of the special conditions and materials of the building: this was illustrated in the iron and glass buildings of London (crystal palaces of 1851 and 1862), Paris (expositions of 1867, 1878, and 1889), Vienna (1873), and New York (1858); the stone, iron, and glass Palais de l'Industrie at Paris (1855), and the iron, timber, and glass buildings of the Philadelphia Centennial Exhibition of 1876. The second type of architecture is that which dresses the exterior of the buildings in a monumentally decorative apparel designed for æsthetic and monumental effects, quite independent of the materials employed. This type made its first appearance in the Columbian World's Fair at Chicago, the buildings of which were all designed as palaces of neoclassic architecture in external appearance, the interiors and roof construction being of iron, timber, and glass. Staff, a material composed largely of plaster of Paris, was employed for this exterior decorative architecture, and ever since has been largely used both in Europe and in America for this purpose. Not only the various American exhibitions (e.g., the Pan-American of 1901 at Buffalo and the Louisiana Purchase Exposition of 1904 at St. Louis), but most of the European exhibitions, of recent times, have followed the example of Chicago, notably the great Paris Exposition of 1900.

Of these two systems of design the first is the most logical; the second, proceeding upon the theory that an exhibition is a temporary affair of a more or less festival character, sacrifices logic to the production of a pleasing, festal, decorative ensemble, and makes free use to that end of perishable materials like staff and wood. Buildings and grounds are together treated in the spirit of a vast, artistic pleasure resort.

Nearly every great exhibition has occasioned the erection of at least one permanent building; the Memorial Art Gallery at Philadelphia, the Trocadéro hall and museum and the Eiffel Tower at Paris, the Grand and the Petit Palais in the same city, replacing the old Palais de l'Industrie, and the elegant Alexander III bridge across the Seine, the Columbian-Field Museum at Chicago, and the Art Gallery at St. Louis, are the permanent monuments of world's fairs in their respective cities.

The original conception of an exhibition housed all the exhibits under one roof, and Sir Joseph Paxton designed the first Crystal Palace (1851) as a single glazed shed, with a lofty arched nave and transept and numerous lower side aisles, constructed of a framework largely of cast iron with fillings of glass like a huge greenhouse. The exterior was the undisguised form resulting from this construction. In the next great exhibition, that of 1855 at Paris, the Palais de l'Industrie was built with stone walls, iron and glass being used for the interior courts and roof. That of 1867 in the same city was

architecturally inconspicuous, consisting of concentric oval rings or aisles with plain gabled roofs. The Paris exhibitions of 1878 and 1889 displayed an earnest effort to produce a new and expressive architecture of metal and glass, with some use of brick and tile; but the results, though interesting, were not sufficiently monumental to win popular approval. One of the best of the single exhibition buildings of iron and glass, though a small one, was that of the New York exhibition in Bryant Park in 1858.

It was the Centennial at Philadelphia that inaugurated the system of separate buildings for distinct classes of exhibits, which has been followed by all world's fairs since that date except those of 1878 and 1889; but it was otherwise inconspicuous architecturally. Three years earlier for the Vienna exhibition of 1873 the English engineer Scott Russell had constructed a rotunda 324 feet in diameter, with a conical roof of iron and glass, the broadest space ever covered, up to that time, by a roof without intermediate supports. This was surpassed at Paris in 1889 by the great Salle des Machines, with a clear span of over 360 feet; and this again by the central hall of the Liberal Arts Building at Chicago in 1893, 1300 feet long and 386 feet wide, the largest area ever covered by a roof of a single span. But in the artistic use of metal in the interior construction of exhibition buildings the French have always led the world. In the Salle des Machines, above referred to, the circular Salle des Fêtes of 1900, and the interiors of the two palaces (Grand Palais, Petit Palais) remaining from that exhibition as permanent monuments, they produced admirable examples of artistic construction in metal and glass quite unequalled elsewhere. See **EXHIBITIONS**.

EXHIBITIONS, INDUSTRIAL. The beginning of these exhibitions may be traced to the so-called "fairs" held in the earlier periods of civilization, both in Asia and in Europe. These are supposed to have originated in religious gatherings, which first gave an opportunity for the exhibition and sale of wares to large numbers of people. From Italy they passed to France, where in 620 that of Saint-Denis was instituted by Dagobert. Those of Aix-la-Chapelle and Troyes date from about 800, and they were introduced into Great Britain by Alfred the Great in 886. Towards the close of the tenth century they became common throughout northern Europe. Such fairs are still prevalent in Holland, although Germany is best known as the modern home of these institutions. The fair of Leipzig, e.g., which dates from the twelfth century, is held three times a year, and attracts from 25,000 to 30,000 foreign merchants at each gathering. The great Russian fair at Nizhni Novgorod occurs in July and August, and the sales during its continuance are said to amount to many millions of dollars. The improvements in the methods of commerce have led to the institution of the more recent industrial exhibitions. These have for their chief object, not the immediate sale of articles, but their exhibition to visitors as an advertisement which may ultimately increase the manufacturer's sales. The first of these modern exhibitions is believed to have been held in Paris in 1798, in the Maison d'Orsay, and included only articles of local manufacture. This exhibition, as well as another held in Paris during the same year, was so successful that Napoleon inaugurated a third exhibition in 1802, and this in

turn led to the establishment of similar triennial exhibitions. The Royal Dublin Society began its series of triennial exhibitions in Dublin in 1829. At first only specimens of native industry were shown, but afterward products of foreign manufacture were shown as well. These proved popular, and subsequently exhibitions were held periodically in other cities of the United Kingdom, notably in Birmingham, Liverpool, and Manchester. It was but natural that such exhibitions should extend to the United States, and the American Institute (q.v.) of New York, founded in 1828, had among its objects the holding of annual fairs at which inventors and manufacturers might exhibit their productions. The Franklin Institute of Philadelphia, founded in 1824, is of a similar character, and has from time to time had various expositions, chiefly devoted to the presentation of scientific developments. Also of a somewhat similar nature is the St. Louis Exposition, which was organized in 1883 and during each year since its inception has held an exhibition of industrial products, accompanied frequently by a display of fine arts. The fairs of the Mechanics' Institutes were a natural development of such institutions and prevailed locally for many years; but with the establishment of museums and libraries, which in recent years have combined under their management special exhibits organized for the occasion, the importance of the larger exhibitions has waned, especially in the United States. With the passing of these local exhibitions there have come in the United States expositions that have been sectional rather than national or local in character, and also commemorative of some historical event. Among these may be mentioned the World's Industrial Cotton Cultivist Exposition, which was held in New Orleans, La., from Dec. 16, 1883, to June 30, 1884; the California Mid-Winter Exposition, held in San Francisco, from Jan. 1 to July 4, 1894. This was followed by the Cotton States and Industrial Exposition, which was held in Atlanta, Ga., from Sept. 15 to Dec. 31, 1895; the Tennessee Centennial Exposition (q.v.), held in Nashville, Tenn., from May 1 to Oct. 31, 1897; the Trans-Mississippi Exposition (q.v.), held in Omaha, Neb., from June 1 to Nov. 1, 1898; the Pan-American Exposition (q.v.), held in Buffalo, N. Y., from May 1 to Nov. 2, 1901; the South Carolina Interstate and West Indian Exposition (q.v.), held in Charleston, S. C., from Dec. 1, 1901, to June 1, 1902. The Lewis and Clark Centennial American Pacific Exposition and Oriental Fair (q.v.), held in Portland, Oregon, from June 1 to Oct. 15, 1905; the Jamestown Tercentennial Exposition (q.v.) held in Hampton Roads, Va., from April 26 to Nov. 30, 1907, and the Alaska-Yukon Pacific Exposition (see under SEATTLE), held in Seattle, Wash., from June 1 to Oct. 15, 1909. Of less importance have been the special expositions, such as the Chicago Railway Exhibition, held in Chicago, Ill., in 1882; the Cincinnati Industrial Exposition, held in Cincinnati, Ohio, in 1883; the Electrical Exhibition, held in Philadelphia, Pa., in 1884; the Marietta Centennial Exposition, held in Marietta, Ohio, in 1888; the Patent Centennial Celebration, held in Washington City in 1891; the National Export Exposition, held in Philadelphia, Pa., in 1899; and the Printing Exposition, held in New York City in 1900.

Among the expositions, many of which were international, that have been held in recent years

and were devoted to some special subjects, may be mentioned the following: of articles connected with the leather industry, in Berlin in 1877; of all kinds of paper and pasteboard, in Berlin in 1878; of fisheries, in Berlin in 1880; of electrical appliances, in Paris in 1881; of geographical exhibits, in Venice in 1881; of cotton, in Atlanta, Ga., in 1881; of early data in American history, in Madrid in 1881; of fisheries, in London in 1883; of historical matters pertaining to Columbus and the discovery of America, in Madrid in 1882; of hygienic, chemical, pharmaceutical, and sanitary objects, in Naples in 1894; of German products and industries, in Berlin in 1896; of fisheries, in Bergen, Norway, in 1898; of maritime industries, in Bordeaux, France, in 1907.

The success of many of the earlier local expositions led to the inauguration of a series of expositions of international character. The first of these, which was announced in 1849, was held under the direction of the Society of Arts in London. The exhibition was opened on May 1, and continued until Oct. 15, 1851, during which time 6,039,195 persons visited it. The total number of exhibitors was 13,938, of whom 6556 were from foreign countries and the remainder from Great Britain and her colonies. The exposition was a financial success, the receipts from admission fees and subscriptions amounting to \$2,444,718, while the expenses were nearly \$1,600,000. The history of the exposition has been preserved in several works, and perhaps most fully in the 13 volumes of reports issued by the commissioners. Its success led the Royal Dublin Society to make its exhibition in 1853 an international one. The exposition was opened on May 12, 1853, and for the first time the display of paintings as a regular feature was introduced. The total number of visitors was about one million, but the exposition proved a failure, as the receipts were less than one-half of the expenditures.

During the same year an Exhibition of the Industry of All Nations was held in New York City. The site chosen was on Sixth Avenue between Fortieth and Forty-second streets, the place being now known as Bryant Park. The principal building was in the form of a Greek cross surmounted by a dome in the centre, and the triangular spaces between the arms of the cross were roofed over at the first story for the purpose of obtaining additional space. In the allotment of space one-fourth of the building was devoted to the exhibits of the United States, one-fourth to those of Great Britain and Ireland, one-fourth to Germany, France, and Belgium, and the remainder to the exhibits of other nations. The exposition was opened with appropriate exercises by President Pierce on July 14, 1853. The cost of the building and running expenses was raised by the issuing of stock to the amount of \$500,000, but, notwithstanding the interest aroused, it was a financial failure.

The next exposition of importance was that held in Paris in 1855 and known as the Paris International Exposition. The site chosen was the Champs Elysées, where the main building, in the form of a parallelogram 827 feet long by 354 feet in width, was erected as a permanent structure to receive future expositions or to serve for great public ceremonies and for civil and military fetes. In addition to the Palais de l'Industrie, as the main building was called, there were separate structures for the exhibi-

tion of the fine arts, agricultural implements and products, etc. This exposition began on May 15 and continued to Nov. 15, 1855, during which time the visitors numbered about four and one-half millions. The industrial and art exhibits shown on this occasion were considered superior to those of all previous international expositions. The expenses amounted to upward of \$5,000,000, while the receipts were scarcely one-tenth of that amount.

Several minor expositions were held in Europe during the years that followed, notably in Edinburgh and Manchester in Great Britain, and in Munich in Bavaria; but the next international exhibition of importance was held in London in 1862. The site chosen was a tract of land in South Kensington, covering an area of about 24 acres, where a permanent structure was erected. About one-half of the space was allotted to the exhibits of the United Kingdom and its colonies, and the other half to foreign countries, and the total number of exhibitors was 28,653. The exhibition was opened on May 1, and closed on Nov. 1, 1862. The number of visitors is given as 6,211,103. The total cost and expenses of the exhibition amounted to nearly \$5,000,000, but the receipts failed to reach that sum by a comparatively small amount.

Minor expositions, although of an international character, were held in Constantinople in 1863, in Dublin and in Oporto in 1865, and in Stockholm and Melbourne in 1866.

In 1864 it was decreed by Emperor Napoleon III that an international exposition should be held in Paris in 1867. A commission was appointed with Prince Jerome Napoleon as president, under whose direction the preliminary work was begun. The site chosen was the Champs de Mars, the great military parade ground of Paris, which covered an area of 119 acres and to which was added the island of Billancourt, of 52 acres. The principal building was rectangular in shape with rounded ends, having a length of 1608 feet and a width of 1247 feet, and in the centre was a pavilion surmounted by a dome and surrounded by a garden, 545 feet long and 184 feet wide, with a gallery built completely around it. In this building were seven concentric galleries, the central space in each of which was allotted to the exhibits of a country, while radial avenues extended from the garden, separating the sections of the several nations from each other. This arrangement was adopted so as to display similar goods from different nations in such a manner that they could be readily compared and studied. In addition to the main building there were nearly 100 smaller structures on the grounds. There were 50,226 exhibitors, of whom 15,055 were from France and her colonies, 6176 from Great Britain and Ireland, and 703 from the United States. The funds for the construction and maintenance of the exposition consisted of grants of \$1,165,020 from the French government, a like amount from the city of Paris, \$1,553,360 as a guarantee fund, and about \$2,000,000 from public subscription, making a total of \$5,883,400; while the receipts were estimated to have been but \$2,822,900, thus leaving a deficit, which, however, was offset by the subscriptions from the government and the city of Paris, so that the final report was made to show a gain. The exhibits were examined by a jury which included some 600 experts, among whom were many of the foremost scientific men of the

world. The exposition was formally opened on April 1, and closed on Oct. 31, 1867, and was visited by 9,238,967 persons, including exhibitors and employees. This exposition was the greatest up to its time of all international expositions, both with respect to its extent and to the scope of its plan.

After minor expositions held in Havre in 1868, Amsterdam in 1869, Sydney in 1870, and Moscow in 1872, the next great international exposition was that held in Vienna in 1873. Preliminary announcements were issued by the Austrian government in 1871, and a commission, of which Archduke Charles Louis was protector and Baron de Schwartz Senborn chief manager, was charged with its inauguration. Accordingly a site on the Prater was chosen, covering 280 acres, where an Industrial Palace consisting of a central nave 2053 feet long, 83 feet, 8 inches wide, and 73 feet, 10 inches high, of six intersecting transepts each 572 feet, 6 inches long, 51 feet, 1 inch wide, and 41 feet high, and of a great rotunda, the largest in the world, of 354 feet diameter at the middle of the nave, was built. Other important buildings were a Machinery Hall, an Art Building, and Agricultural Halls, and also a large number of smaller special buildings. There were 55,492 exhibitors, whose exhibits were classified into 26 groups, and were duly examined by an international jury of awards, who distributed diplomas of honor and medals for progress, merit, good taste, fine arts, and for coöperators. There were 643 exhibits shown by the United States, for which 349 awards were made as well as 26 medals for good taste and coöperation, making a total of 375. The cost of the buildings and running expenses was nearly \$10,000,000, while the receipts were about \$2,000,000, leaving a deficit of nearly \$8,000,000, which was made up by government appropriation. The total number of visitors was 7,254,687. At this exposition was inaugurated the custom of gathering together men interested in various specialties, whose meetings took the form of congresses. Among these were the International Patent Congress, the International Congress for National Economy, that for Complex Instruction, Linen Industries, etc. The exposition was opened with appropriate ceremonies on May 1, and closed on Oct. 31, 1873.

The importance and value of international expositions shown by those held abroad led to a determination on the part of the United States to celebrate the centennial of the independence of the United States by an international exposition to be held in Philadelphia in 1876, a description of which forms the subject of a special article under the title of CENTENNIAL EXPOSITION, INTERNATIONAL (q.v.).

The French government, desirous of showing to the world the assured success of the Republic, and incidentally to recommend the French system of industrial protection, determined to hold a universal exposition in Paris in 1878, and an invitation was issued by President MacMahon inviting all nations to participate. The site selected was the Champs de Mars, as in the exposition of 1867, to which was added an elevated plateau on the opposite side of the Seine, known as the Trocadéro, and connected by the historical bridge of Jena. The main building, of iron and glass, was rectangular in form and covered 27,900 square yards. The art galleries and the buildings erected for the special exhibits made by the authorities of the city

of Paris occupied a court in the centre of the building. The Palace of the Trocadéro was of stone and remained as a permanent memorial of the exposition. In addition there were numerous smaller structures in which special exhibits were shown, and the various buildings of foreign governments. The cost of the exposition was over \$6,000,000, which sum was raised by grants from the French government and the city of Paris, but the receipts were only about \$2,000,000. The total number of exhibitors was about 52,835, which was less than in Vienna, and was explained by the fact that several governments, including Germany, refused to participate in the exposition. The exhibits were viewed by an international jury who distributed among the exhibitors from the United States 10 grand prizes, 7 special prizes, 143 gold medals, 224 silver medals, 277 bronze medals, and 208 honorable mentions. International congresses were held continuously throughout the exposition, and in all some 30 were convened at which representatives from foreign governments were present and discussed the subjects under consideration. The exposition was formally opened on May 1, and continued until Oct. 31, 1878. The total number of admissions to the exposition was 16,159,719.

Among the minor expositions that followed the Paris Exposition may be mentioned those held in Amsterdam in 1883, Calcutta in 1884, Antwerp in 1885, Edinburgh in 1886, and Melbourne in 1888.

It had become a custom for the French government to hold an exposition every 11 years, and accordingly invitations were issued to foreign governments to attend a universal exposition to be held in Paris in 1889, ostensibly to celebrate the centenary of French independence. The grounds selected for the exposition were the Champs de Mars, 128 acres; the Trocadéro Garden, 42 acres; the Esplanade des Invalides, 38 acres; and the Quai d'Orsay from the Champs de Mars to the Ministry of Foreign Affairs, 20 acres, making a total of 228 acres. The principal building was the Palace of Industries, which was a large parallelogram flanked by two wings and covering 1,138,930 square feet. It was surmounted by a central dome 195 feet high and having an exterior diameter of 120 feet. Beyond this were the twin palaces of the Fine and Liberal Arts, each of which covered 202,232 square feet and was surmounted by a cupola 183 feet high. Numerous other smaller structures were on the grounds, including those of various governments. The important architectural feature of the exposition, however, was the famous Eiffel Tower (q.v.), 984 feet high, which remained as a memorial. The total number of exhibitors was over 61,722, whose displays were examined by a jury of awards who recommended 33,139 awards. More than 70 international congresses convened during the exposition, and delegates from various governments were appointed to discuss the subjects that were brought before them. The exposition was opened on May 6, and closed Nov. 6, 1889, and was visited by 25,121,975 persons.

No expositions of importance took place in the years that followed until 1893, when the four hundredth anniversary of the discovery of America was celebrated in the United States by the World's Columbian Exposition (q.v.), held in Chicago, Ill.

Subsequent to the World's Fair held in Chicago, many of the exhibits shown there were

taken to San Francisco, and an exhibition known as the California Mid-Winter Exhibition was held during 1894, and this was followed in the United States by a series of commemorative expositions, a list of which is given elsewhere in this article. Likewise there were several minor expositions abroad, of which perhaps the most important was that held in Brussels in 1898, at which commissioners representing the United States were present.

The proposition of holding a World's Fair in Paris in 1900 began to take shape as early as 1892. The location chosen was that similar to the previous expositions, and included the Champs de Mars and the Trocadéro Garden, the Esplanade of the Invalides, together with narrow strips on each bank of the Seine, connecting on the south side the Esplanade of the Invalides with the Champs de Mars, and on the north side connecting the park of the Art Palaces with the Trocadéro, making in all an area of 336 acres, also with an annex in the Bois de Vincennes devoted to exhibits of transportation and sports. Across the river on the Esplanade of the Champs de Mars were the special buildings devoted to the exhibition of science and art, education, engineering, and means of transportation, mechanical industries, agriculture and food, chemistry, mechanical appliances, textile industries, mining and metallurgy, etc.; while those along the south bank of the Seine were the buildings of the naval and military exhibits, followed by the structures erected by the various nations, until the Esplanade des Invalides was reached, where were the palaces of foreign industry and decorative art. For the erection of these various buildings and running expenses of the exposition a fund amounting to upward of \$27,000,000 was raised, part of which was contributed by the national government, by the municipality of Paris, and part by the issuing of bonds, each of which had a face value of 20 francs, and consisted of 20 admission tickets with numbers for various lottery drawings, and also by a sum of money advanced by the Bank of France. Exhibits were classified into 18 groups, the subdivisions into 121 classes. The official catalogue gave 79,712 exhibits, of which 31,946 were from France and 6674 from the United States. An international jury of awards examined the exhibits, recommending 42,790 awards. The usual series of international congresses were held, and announcements for over 125 were made. The exhibition was opened on April 14, and continued until Nov. 11, 1900, during which time it was visited by more than 50,000,000 persons, and, on Sept. 6, 600,528 were reported to have passed through the gates, which was the largest attendance for any single day. A financial statement issued at the close of the fair showed a deficit of about \$400,000, so that the exposition may be considered to have been a financial success, especially when it is remembered that the value of the permanent buildings was very much greater than the deficit.

This summary of the history of world's fairs may properly be closed with the mention of the exposition held in St. Louis in 1904, known as the Louisiana Purchase Exposition (q.v.), in celebration of the centennial anniversary of the purchase of the Territory of Louisiana from France: to be followed by the Panama Pacific International Exposition (q.v.), held in San Francisco, Cal., from Feb. 20 to Dec. 4, 1915.

Among the recent minor expositions abroad

were the following; Liège, Belgium, 1905; Quito, Ecuador (celebrating the centenary of independence), 1809; Brussels, Belgium, 1910; Buenos Aires, Argentina (celebrating the centenary of independence), 1910; Turin, Italy (celebrating the semicentenary of proclamation of independence of Kingdom of Italy), 1911; and Ghent, Belgium, 1913.

EX'ILE. See BABYLONISH CAPTIVITY.

EX'ILE. Expulsion from one's native country by government authority for a period or for life; also, residence abroad in a foreign land either under compulsion by law, or voluntarily to avoid some form of punishment, exposure to which would follow continued residence in the native land. Exile in the first sense (expulsion) may be either simple exclusion upon pain of death or some lesser penalty, or may take the form of transportation to some foreign or secluded land to which the exiled person is confined.

Among the Greeks exile was the legal punishment for homicide, murder of an alien, instigation to murder, and malicious wounding; but it did not originally exist among the Romans, although the interdiction of fire and water practically amounted to the same thing. As a political measure, expulsion from the country was resorted to in Greece, and it might involve loss of the rights of citizenship and the forfeiture of property, except in cases of ostracism (q.v.).

At Rome the interdiction of fire and water (*interdictio aquæ et ignis*) was the penalty for such serious crimes as treason, arson, and poisoning; and the accused was at liberty to anticipate an unfavorable result of a trial by going into voluntary exile. This voluntary exile did not arise as a substitute for punishment at home, but from the fact that the interdiction was a survival of a ruder form of justice in which the state merely outlawed the criminal and left him to the private vengeance of the injured parties, which he escaped by fleeing to the pro-

tection of foreign lands whither the state had no reason to pursue him. Loss of civic rights, therefore, did not follow voluntary exile unless the exile was declared to be deserved, or the interdiction was subsequently pronounced, or the refugee became a citizen of a foreign state. Confiscation of property took place only in extreme cases. Sometimes the interdict was pronounced for political purposes, as in the case of Cicero. Originally it was pronounced by the *Comitia Centuriata*, and later by the judicial commissions appointed to try offenses.

Direct expulsion was first practiced under the Empire under the names of *deportatio* and *relegatio*. *Deportatio* was a form of banishment to a specified locality (usually an island), involving loss of civic rights and usually forfeiture of property; *relegatio* was a milder form which did not affect the rights of the man as a citizen. Among modern nations exile survives as a punishment in the form of transportation to penal colonies or settlements, as in the case of the former penal colonies of Australia and Tasmania (Van Dieman's Land) of Great Britain, and the Siberian colonies of Russia (see AUSTRALIA; TASMANIA; SIBERIA); but with the increase of civilization this form of punishment is being abandoned.

The right of an alien to demand and receive protection for his person and property in the country where he resides has always received general recognition among civilized nations, and aliens who are refugees from punishment for political crimes or *mala prohibita* and not *mala in se* are not among the classes included in the treaties for extradition now commonly existing between civilized nations. This protection, however, is territorial only and extends solely to those aliens within the boundary of the state, unlike the protection to citizens which the state affords at all times and places. Such a refugee is amenable to the laws of the country where he resides, and may there be punished for any acts there committed by him which are crimes by the law of that land; but the fact that he is an accomplice in plots against his native country with others there is rarely considered a reason for surrendering him upon demand, except when the demand is made by a superior power which will not brook a refusal. For further information, consult such related articles as ALIEN; EXTRADITION; PUNISHMENT; BANISHMENT; TRANSPORTATION, PENAL; and consult the authorities referred to under ALIEN; EXTRADITION; PUNISHMENT; INTERNATIONAL LAW; ETC.

EX'TINE (from Lat. *ex*, out). In plants, the outer one of the two layers of a spore wall, the inner one being called the intine. The exine is the protective layer, being comparatively thick and impervious and often developing a rough surface or appendages of various kinds. It is often called the exospore. See SPORE.

EX'MOOR. A former forest, but now a moorland region, 30 square miles in area, in the west of Somersetshire and northeast of Devonshire (Map: England, C 5). It consists of dark ranges of hills, deep wooded glens, and lonely valleys. Its highest point is Dunkery Beacon, 1707 feet above sea level. It is the sole remaining habitat of the wild red deer of England and is known for distinctive breeds of sheep and ponies. It has iron and copper mines and is graphically and romantically described in Blackmore's *Lorna Doone*.

EXMOUTH, eks'mūth (AS. *Ewan mūþa*, mouth of the Exe). A seaport, market town, and watering place of Devonshire, England, on the English Channel, at the mouth of the Exe, 10 miles southeast of Exeter (Map: England, C 6). It is picturesquely situated on a hill rising from the sandy estuary of the Exe and is noted for its mild climate. The Woodbury hills, 800 feet high, protect it from the east winds. It is an attractive little town, with a good beach for bathing, a fine sea wall, handsome terraces and promenades, assembly rooms, libraries, and the usual features of a watering place. New docks were opened in 1869. Its chief industries are lace making and fisheries. Pop., 1901, 10,485; 1911, 11,963. The town is of considerable antiquity. Here Sweyn the Dane landed in 1003. It was taken by the Royalists in 1646.

EXMOUTH, EDWARD PELLEW, VISCOUNT (1757-1833). An English admiral. He was born at Dover, of a Cornish family. He was educated at the Truro Grammar School and entered the navy at 13 years of age. When only 19, he showed conspicuous gallantry, after his superior officers had been severely wounded, by saving his vessel, in the battle of Lake Champlain, Oct. 11, 1776. In command of a naval brigade he took part in Burgoyne's campaign in the following year. In 1782 he attained the rank of post captain, and in 1793 he captured the *Cléopâtre*, a French frigate. For this victory he was knighted. In 1799, in command of the *Impétueuse*, he harassed the French coast and won several brilliant actions. In the same year his personal influence and bravery quelled the mutiny in Bantry Bay and saved the British fleet to the country. In 1804 Sir Edward Pellew was advanced to the rank of rear admiral, and in 1814 was created Baron Exmouth of Canonteign, Devonshire. In 1816 he went to Algiers with a fleet of 16 vessels to enforce the abolition of Christian slavery and the liberation of all Christian slaves. Three thousand Christians, mostly Spaniards and Italians, were freed and conveyed to their respective countries. Exmouth received the thanks of Parliament on his return to England and was promoted to the rank of Viscount. In 1821 he retired from public service, but shortly before his death, Jan. 23, 1833, he was honored with the rank of vice admiral of England. Consult Osler, *Life of Admiral Viscount Exmouth* (London, 1844); and Mahan, *Types of Naval Officers* (Boston, 1891).

EXNER, KARL (1842-). An Austrian physicist. He was born at Prague and was educated at Vienna and Zurich. In 1885 he became president of the Chemico-Physical Society in Vienna and in 1892 was appointed lecturer at the University of Innsbruck. From 1894 to 1904 he was professor of mathematical physics at that university. In the latter year he retired, though he continued to live at Innsbruck and to retain his interest in physics and meteorology. His publications include: *Ueber die Fraunhoferschen Ringe* (1877); *Ueber das Funkeln der Sterne* (1881); *Ueber Beugungsercheinungen* (1885); *Ueber die polarisierende Wirkung der Lichtbeugung* (1890-92); *Genesis der Erklärung des Scintillation* (1901).

EXNER, SIEGMUND (1846-). An Austrian physiologist. He was born at Vienna and after studying there and at Heidelberg lectured at Vienna University, where in 1875 he became professor of physiology, and where in 1891 he was made a member of the board of direc-

tors of the Physiological Institute. He made numerous investigations on the physiology of the nervous system and twice received the prize awarded by the Vienna Academy of Sciences for original researches. His publications include: *Leitfaden bei der mikroskopischen Untersuchung tierischer Gewebe* (2d ed., 1878); *Untersuchungen über die Lokalisation der Funktionen in der Grosshirnrinde des Menschen* (1881); *Die Innervation des Kehlkopfes* (1884); *Die Physiologie der facettierten Augen von Krebsen und Insekten* (1891); *Entwurf zu einer physiologischen Erklärung der psychischen Erscheinungen* (1894). In 1887 he became coeditor with Gad of the *Centralblatt für Physiologie*.

EXNER, WILHELM FRANZ (1840-). An Austrian technologist, born at Günsersdorf and educated at the Polytechnic Institute of Vienna. In 1874 he was appointed inspector of industrial schools in the Ministry of Commerce. With Banhans and others he founded in 1879 the Industrial Museum at Vienna and became its director. He was elected to the Austrian Chamber of Deputies in 1882, 1885, and 1891. His works include: *Das moderne Transportwesen im Dienste der Land- und Forstwirtschaft* (2d ed., 1880); *Werkzeuge und Maschinen zur Holzbearbeitung* (1878-83); *Die Hausindustrie Oesterreichs* (1890); *Das K. K. Technologische Gewerbemuseum in Wien im ersten vierteljahrhundert seines Bestandes* (1904).

EXOAS/CUS. A genus of parasitic fungi causing various kinds of deformities on seed plants, especially trees. One of the species causes the disease known as peach curl, which results in a characteristic crinkling and deformity of the leaf. Another species forms the so-called plum pockets, in which the young plums become of abnormal size and shrivel. Other species form brushlike deformities on certain trees, known as witch brooms.

EX'ODUS (Lat., from Gk. ἐξόδος, *exodos*, way out, from ἐξ, *ex*, out + ὁδός, *hodos*, way). The Latin name of the second book of the Pentateuch, so called from the fact that it treats of the deliverance of the Hebrews from Egypt. It contains, however, much more than this. Taking up the narrative with the death of Joseph, where Genesis left off, it recounts the oppression of the Hebrews by their Egyptian taskmasters; the birth, youth, and call of Moses (chaps. i-vi); the plagues and the deliverance from Egypt (vii-xv); the way to Sinai and the establishment of the Covenant with Yahwe, incidental to which a series of laws is set forth (xvi-xxiv); directions for the construction of the tabernacle (xxv-xxx); the sin of the golden calf (xxxii-xxxiv); the making of the tabernacle and its furniture, and the setting up of the edifice (xxxv-xl).

It will thus be seen that Exodus is a mixture of historical narrative with legislative material. The legal sections are (1) Ex. xx. 23-xxiii. 19, known as the Book of the Covenant; (2) the Decalogue, Ex. xx. 1-17; and (3) an older Decalogue, Ex. xxxiv. 10-28. (See DECALOGUE.) In the opinion of many scholars these legal sections date from different periods, while the historical sections also come from different sources, and there are many interpolations, notably in chaps. xxxv-xl. (See PENTATEUCH.) As to the historical character of the exodus from Egypt, the legislation at Sinai, and the tabernacle, there is much difference of opinion among scholars. Some maintain that Israel as

a whole, or at least the Joseph tribes, once lived in Egypt and escaped from bondage across some northern projection of the Gulf of Suez, while others regard the Egyptian setting as secondary and think of a successful crossing of the Gulf of Akabah (q.v.); some hold that the Decalogue in Exodus xx. 1-17 and the Book of the Covenant were promulgated by Moses at Sinai, whether this mountain be looked for east or west of the Aelanitic Gulf (see SINAI), while others consider these laws as of Palestinian origin; and though the description of the tabernacle is widely recognized as idealized, there are those who assign some such structure to the nomadic period, while others see in it only a reflection of Solomon's temple projected into the past. Consult the commentaries on Exodus, particularly those of Dillmann (Leipzig, 1880), Ryssel (ib., 1897), Bährsch (Göttingen, 1900), Holzinger (ib., 1900); Bennett (Oxford, 1908), McNeile (New York, 1908), Driver (ib., 1911); Popper, *Der biblische Bericht über die Stiftshütte* (Leipzig, 1862); Bacon, *The Triple Tradition of Exodus* (Hartford, 1894); Eduard Meyer, *Die Israeliten und ihre Nachbarstämme* (Halle, 1906); Gressmann, *Mose und seine Zeit* (1913).

EXOAMY. Marriage outside of a group; i.e., the system of permitting marriages only between members not belonging to the same group. The term is correlative with endogamy (q.v.). Etymologically it would be justifiable to identify exogamy with the rules preventing incest, and in this wide sense of the term probably every tribe in the world might be reckoned as exogamous, since some sort of restrictions of marriage seems to occur everywhere, though the character of the incest group differs widely. More particularly, however, modern usage restricts the term to definite social units of the character of moieties, clans, gentes, the Australian classes, etc., though local exogamy likewise occurs.

The speculations of Lewis H. Morgan have had great influence on the study of exogamy. He held that there was a period in human history when brothers and sisters intermarried. At a certain stage, practically universal except in Polynesia, this was precluded by organizing into a one-sided kinship group those connected by descent from the same female through females and prohibiting marriage within this group (clan). The same result might have been achieved by a corresponding patrilineal group (gens); but, according to Morgan, this could develop only at a later stage, when fatherhood had become less uncertain than in the primitive conditions of sexual license upon which he assumes the exogamous scheme to have been imposed. Morgan's theory presupposes the practical absence of marriage restrictions prior to the institution of clan exogamy. It has been discovered, however, that such restrictions, based on blood kinship, not only coexist with clan or gentile marriage prohibitions, but exist in the absence of clan or gentile systems, which are lacking in North America precisely among the most primitive tribes. In other continents somewhat similar results have been obtained; thus, among some of the most primitive tribes of New Guinea there are no exogamous clans or gentes, yet there are incest prohibitions based on blood relationship. In short, incest regulations are universal, clan or gentile exogamy is not. Moreover, clan or gentile exogamy may be a secondary result of relationship restrictions, as seems

to be the case among the Blackfoot and Todas, where the prohibitions applying to blood relatives exclude ipso facto all fellow gentiles. Illustrations of this type make it next to impossible to give a single psychological explanation of exogamy. Indeed, even to-day the psychological nature of the exogamous clan or gentile rule is by no means uniform. In Australia and north-western America, e.g., it appears to approach in rigor our own incest feelings; but among other tribes, such as the Blackfoot or Crow Indians, transgressions are resented rather as breaches of etiquette, and there is no proof of any earlier sentiment akin to that of the above-mentioned tribes. It will therefore hereafter be necessary to seek for specific causes of exogamy in every area studied, though common factors may be determined as the result of such an inquiry. More particularly the notion that members of a totem group practice exogamy because of their descent from the putative totem ancestor must be considered untenable. Totemism and exogamy frequently coexist, but very often they do not; and in many instances the totemic exogamy found is derivative, i.e., is a corollary of the exogamous rule attached to a larger nontotemic division.

Westermarck has suggested, as a cause of incest regulations, a hypothetical instinct against mating existing between those who are brought up together in close familiarity. This suggestion has been accepted by some other scholars, but is not by any means established. Even less satisfactory is the theory that primitive men consciously sought to check the harm due to marriages of near kin; for it is not only doubtful whether such marriages are really harmful, but the theory assumes a degree of rationalizing activity that is quite inadmissible in primitive conditions.

Since exogamy is bound up with various other ethnological phenomena, the literature bearing on it is immense. The following list, therefore, comprises only some of the most helpful general treatises: Morgan, *Ancient Society* (New York, 1877); Lang, *Social Origins* (London, 1903); Thomas, *Kinship Organizations and Group Marriage in Australia* (Cambridge, 1906); Frazer, *Totemism and Exogamy* (London, 1910); Goldenweiser, "Totemism: An Analytical Study," *Journal of American Folk-Lore*, pp. 179-293 (1910); Cunow, *Zur Urgeschichte der Ehe und der Familie* (Stuttgart, 1912).

EX'OGEN (from Gk. ἔξω, *ewō*, outside + -γενής, *-genes*, producing, from γίγνεται, *gignetai*, to become). An obsolete term, formerly applied to dicotyledons. See DICOTYLEDON.

EX'OGYRA (Neo-Lat. nom. pl., from Gk. ἔξω, *ewō*, outside + γύρος, *gyros*, circle). A genus of fossil pelecypods of the oyster family (Ostreidae), found in the rocks of Upper Jurassic and Cretaceous age. The shells are inequilateral, with only one muscle, and they resemble somewhat the form of the young plicate shells of the modern edible oyster, though they are larger and more convex, and the beaks of their valves are spiral. The left or larger valve is deeply convex, often fixed by its apex, and is usually strongly ornamented by radial folds of the surface, and sometimes also by imbricating plates. The right valve is flat or concave and operculum-like, with a surface that is either smooth or marked by faint radiating lines. *Exogyra costata* of Say, with a length of 3 to 8 inches, is very abundant in certain beds of the Cre-

taceous system of the Atlantic and Gulf coastal plain. See OYSTER.

EXONERATION (Lat. *exoneratio*, from *exonerare*, to unload, from *ex*, out + *onerare*, to load, from *onus*, load). In its broadest sense, the act of discharging or the state of being discharged from some liability or obligation. A person who has become bail for another may entitle himself to exoneration by surrendering his principal. At common law the devisee of lands which were subject to a mortgage given by his deviser, or the heir of such person upon inheriting the lands, was entitled to have the land exonerated from the mortgage debt—i.e., to have that debt paid out of the personal estate of the mortgagor. This rule has been changed in England and in many of our States by statute. At present the term is most frequently applied to the right of a surety to call upon the principal debtor to pay the guaranteed debt and thus relieve the surety from his liability thereupon. This right accrues as soon as the surety is put in danger of being compelled to pay his principal's debt. If the creditor will not proceed against the principal, the surety may file his bill in equity for the purpose of compelling the principal to satisfy the debt, it being unreasonable that a surety should always have such a cloud hanging over him. Consult: Williams, *Principles of the Law of Real Property* (22d ed., Toronto, 1914); Redfield, *Law and Practice of Surrogate's Courts* (7th ed., New York, 1910); De Colyar, *Treatise on the Law of Guarantees and of Principal and Surety* (London, 1900).

EX'OPHTHALMIC GOITRE, goi'tēr. See BASEDOW'S DISEASE.

EX'ORCISM (Lat. *exorcismus*, from Gk. *ἐξορκισμός*, *exorkismos*, exorcism, from *ἐξορκίζειν*, *exorkizein*, to administer an oath, from *ἐξ*, *ex*, out + *ορκίζειν*, *orkizein*, *ορκούν*, *orkoun*, to administer an oath, from *ορκος*, *orkos*, oath). The act of conjuring evil spirits, in the name of God, to depart out of the person possessed. It has been practiced in many religions and was especially common in ancient Babylonia. In the first Christian century it was a common custom of both Gentiles and Jews. The first Christians adjured evil spirits in the name of Jesus Christ; but as the opinion was entertained that all idolaters belonged to the kingdom of Satan, it was customary to exorcise heathens previous to their receiving Christian baptism; and since, on the theory of original sin, all infants were regarded as belonging to Satan's kingdom, exorcism became general at the baptism even of Christian children.

Of its exercise in the early Church, both in relation to energumens (q.v.), or persons possessed, and in the administration of baptism, there are numerous examples. The rite of exorcism is used by the Catholic church in three different cases: in the case of actual or supposed demoniacal possession, in the administration of baptism, and in the blessing of the chrism or holy oil, and of holy water, with the view of withdrawing from the power of Satan creatures which are to be used in the service of God. Its use in cases of possession is now extremely rare and in many diseases is prohibited unless with the special permission of the bishop. In baptism it precedes the ceremony of applying the water with the baptismal form. It is used equally in infant and in adult baptism, and Roman Catholic writers appeal to the earliest examples of the administration of the

sacrament as evidence of the use of exorcism in both alike. The rite of baptismal exorcism in the Roman Catholic church follows closely the scriptural model in Mark viii. 33. The exorcisms in the blessing of the oil and water resemble very closely the baptismal form, but are more diffuse. See DEMONIAC.

EX'ORCIST. A title of the second of the minor orders of the Roman Catholic church. Down to the middle of the third century the power of exorcism (q.v.) was exercised by Christians generally, without special authorization. Pope Fabian (236-251) seems to have been the first to assign a definite name and functions to exorcists as a separate order. The Fourth Council of Carthage (398) prescribed a rite of ordination for exorcists. The ceremonies of exorcism may be performed by any priest, since he is ordained exorcist on his way to the priesthood; but in many dioceses he must obtain special permission of the bishop. See ORDENS, HOLY.

EX'OSTEMMA (Neo-Lat., from Gk. *ἐξω*, *exō*, outside + *στέμμα*, *stemma*, garland). A genus of American trees and shrubs of the family Rubiaceæ, nearly allied to *Cinchona*. Several species yield febrifugal barks, which, however, do not contain the cinchona alkaloids. The most valued of these are Caribbee bark, Jamaica bark, and St. Lucia bark, the latter of which is the produce of *Exostemma floribundum*, a native of the more mountainous parts of the West Indies.

EX'OSTO'SIS (Neo-Lat., from Gk. *ἐξ*, *ex*, out + *ὀστέον*, *osteon*, bone). A bony tumor or excrescence growing from some of the osseous structures of the body. See TUMOR.

EX'OTERIC. See ESOTERIC.

EXPANSION. See HEAT.

EXPANSION (as a political term). See IMPERIALISM; UNITED STATES, EXTENSION OF THE TERRITORY OF THE.

EX PAR'TE (Lat., from a part). From or on behalf of a designated party. The term is frequently used in the title of a legal proceeding. For example, if Shand is adjudged bankrupt the title of the bankruptcy proceedings is *In re Shand*; and if a creditor named Corbett makes an application in the cause for an order or determination in his behalf, his proceeding is entitled, *Ex parte Corbett in re Shand*. So, if Smith applies for leave to sue an official bond or for some particular writ (q.v.), this preliminary proceeding is entitled *Ex parte Smith*. The term is also used to describe the application or proceeding itself. Statements made in a judicial proceeding under such circumstances that the opposite party has no opportunity to challenge their accuracy are often spoken of as *ex parte*.

EXPA'TRIATION (from ML. *expatriare*, to banish from one's country, from Lat. *ex*, out + *patria*, fatherland, from *pater*, father). Change of residence and allegiance from one's native or adopted land to another country and government, arising by voluntary act or by operation of law. It has been declared by the United States Congress to be "a natural and inherent right of all people, indispensable to the enjoyment of the rights of life, liberty, and pursuit of happiness." (*United States Revised Statutes*, 1909, 2000.) In the same statute Congress characterized every opinion, order, or decision which denied, restricted, impaired, or questioned the right of expatriation, as inconsistent with the fundamental principles of the Republic. These statutory declarations fairly represent the view now

prevailing in this country. In the War of 1812 Great Britain denied the right of expatriation to her citizens, holding that they could not renounce their native allegiance and assume a new one without her consent. This doctrine was accepted by Chancellor Kent as in accord with the principles of the common law. It no longer obtains, however, either in this country or in Great Britain. In 1870 an Act of Parliament and a treaty with the United States committed the British government to an acceptance of the rule contended for by her opponent in the War of 1812. Under this statute and treaty any British subject who at any time may become naturalized in a foreign state shall be deemed to have ceased to be a British subject and shall be regarded as an alien. Provision is also made for a formal declaration of allegiance by a person who is a British subject according to British law, but a foreign subject according to foreign law. It is further declared that a British woman by marriage with a subject of a foreign state is expatriated, and that a minor child changes its nationality with the expatriation of its father or widowed mother, provided it resides abroad with such parent. Expatriation of American citizens is regulated by the Law of March 2, 1907. By this law an American citizen is held to have expatriated himself when he has been naturalized in any foreign state. When a naturalized citizen of the United States has resided for two years in the foreign state from which he came, or five years in any other foreign state, he is presumed to have ceased to be an American citizen. But no American citizen is allowed to expatriate himself in time of war.

An American woman who marries a foreigner takes the nationality of her husband. Upon the termination of the marital relation she may resume her American citizenship, if residing in the United States, by continuing to reside there; if residing abroad, by returning to reside in the United States, or by registering as an American citizen with an American consul within a year of the termination of the marital relation. A foreign woman who acquires American citizenship by marriage to an American retains her American citizenship upon the termination of the marital relation if she continues to reside in the United States. Consult the articles on ALIEN; LAW; NATURALIZATION; and the authorities referred to under those titles.

EXPECTATION (Lat. *expectatio*, from *expectare*, to expect, from *ex*, out + *spectare*, to behold, from *spicere*, to look). The term is usually defined as an anticipatory attention, and the expectant consciousness is said to be dominated by an anticipatory image of the expected event. Neither of these statements, however, is strictly true. Experiments have shown that there are two situations in which expectation may arise. 1. The experience begins with a perception; the observer, after the perception, awaits another perception that in the past has followed the first; e.g., when a step is heard at the door, one expects a ring. The "awaiting" of the second perception here constitutes the expectant attitude. In consciousness this attitude is characterized by strain and other organic sensations and by verbal ideas; either of these complexes may be predominant, and either of them may retire to the background. An image of the awaited perception may or may not be present; it is not essential, and usually it is absent. 2. In the second situation there comes into con-

sciousness a perception which has not been wrought by experience into a definite series. In such a case one expects something, but does not know what; one hears a ring, and expects "somebody." Introspection shows, however, that the pattern of consciousness is the same as before; the situations are different, but the expectant attitudes aroused by them are qualitatively the same. The sensational elements are the conscious aspect of the perceptive determination; they are the vehicle of the meaning "so-and-so is going to happen." (See DETERMINATION.) They derive in part from the bodily attitude of attention: tense muscles, inhibited breathing, accommodation of the sense organs. The expectant consciousness can, nevertheless, hardly be termed attentive; the kinæsthetic sensations are, truly, at the focus, but are not focal in their own right; they are given rather as context, as meaning, than as independent processes. Functionally the expectant consciousness lacks definiteness and clearness because it exists not for itself but for a consciousness about to be; it is a preparatory, a transitional consciousness.

It is clear that a suitable direction of expectation is the *sine qua non* of a full apprehension or clear apperception of the awaited impression. Hence it is customary, in all forms of psychological experimentation, to give a signal (a spoken "Now!" or the stroke of an electric bell) to the observer, at such an interval before the presentation of stimulus that expectation may just have time to reach its maximum without passing over into fatigue. The time required, at least in the simpler departments of experimental work, amounts to 1.5 or 2 seconds. During this period the observer has an opportunity to concentrate himself upon the problem in hand, either in a general way, by banishing irrelevant ideas and thoughts, or, more specifically, by calling up a definite mental image of the coming stimulus. Suppose, e.g., that the two points of a pair of compasses are to be set down simultaneously upon the skin of the wrist, at a certain distance apart, and that the observer is to say whether he senses one or two pressures. On hearing the ready signal, he will (a) devote his attention exclusively to the wrist and purposely ignore any accidental stimulation of eye or ear; while (b), if he has had previous experience in the discrimination of two points upon the skin, he will represent to himself, in terms of pressure sensation or otherwise, the various forms that cutaneous duality may take.

Expectation, then, if rightly directed, is of essential service to the experimental psychologist. But predisposition may be a source of error, as well as a help, in laboratory work. Suppose that we wish to ascertain the least separation of the compass points that can evoke the introspective response "two pressures." We shall begin with a separation of the points at which only one pressure is perceived and gradually increase this separation, in successive trials, until the judgment "one" passes over into the judgment "two." We secure the observer's full attention, at each application of the instrument, by means of our ready signal. Since, however, we are making a series of tests, and the series is progressing in a known direction (from oneness towards twoness), the observer may easily become prejudiced; at each fresh step of the series he may think, "This time there must be two!" The judgment "two" will therefore come too soon; our result is vitiated by the error of

expectation. In all such cases some method must be devised whereby this error may be eliminated. In the present instance we seek to eliminate it by reversing our series. We begin a second set of tests with a separation of the compass points that gives two clear pressures, and work down, step by step, until "two" passes over into "one." The "one" comes too soon, in this reversed series, as the "two" came too soon in the preceding series. By averaging the results of the two procedures, in a number of series, we may hope to rule out the expectation error.

Consult: Wundt, *Outlines of Psychology* (Eng. trans., Leipzig, 1907); Kulpe, *Outlines of Psychology* (Eng. trans., London, 1909); Titchener, *Experimental Psychology*, II, ii (New York, 1905); id., *Test-Book of Psychology* (ib., 1910). See HABIT; PRACTICE; PSYCHOPHYSICS.

EXPECTATION WEEK. A name sometimes given to the period between Ascension Day and Whitsunday, because during this time the Apostles continued praying in earnest expectation of the Comforter.

EXPECTORANT (from Lat. *expectorare*, to drive from the breast, from *ex*, out + *pectus*, breast). Any medicine given to carry off the secretions of the respiratory tract. (See BRONCHITIS; BRONCHITIS.) The National Formulary gives the following list of expectorants: *Sedative*, antimon. et potas. tart. apomorphia, ipecac, potas. citras; *Stimulant*, ammonii carbonas, ammonii chloridum, benzoin, tolu, creosotum, eucalyptus, grindelia, guaiacol, pix liquida, scilla, senega, sanguinaria, terebenthinum, and terpinii hydras.

EXPECTORATION. The act of spitting; also the *sputum*, which is the Latin name for the mucus or other secretion discharged from the air passages. The examination of expectoration is of the utmost value in the diagnosis of diseases of the chest. Often the nature of an ailment can be determined or the diagnosis confirmed by the examination of the expectoration. In simple bronchitis the sputum is frothy and colorless and floats on water. In chronic bronchitis it is generally yellowish or greenish, and, owing to an admixture of pus, it sinks in water. If the sputum be tinged with dark blood, pneumonia is suspected. In tuberculosis of the lungs bright blood may be coughed up, or mucus of a pink tint from the coloring matter of blood, or the sputum may be very abundant, viscid, or greenish. It may have an offensive odor in tuberculosis and is always so characterized in gangrene of the lung. But the diagnosis does not rest entirely on the appearance of the sputum or the examination of the chest. Methods of staining certain elements and the use of the microscope will decide upon the presence or absence of the tubercle bacillus; Pfeiffer's bacillus, of *la grippe*; the pneumococcus and the pneumobacillus, of pneumonia; streptococcus, of pus infection; or other bacilli, as well as elastic fibres from the lung. In certain cases expectoration of mucus is to be encouraged, and cough must not be checked. In all cases of known or suspected communicable disease, as influenza (*la grippe*), pneumonia, or tuberculosis, the sputum must be received in a vessel in which it is kept moist until destroyed by disinfectants or burned. Carpets, furniture, and bedding should be protected from expectoration in these cases of disease, and sheets, pillow cases, handkerchiefs, napkins, and night clothing should be frequently changed and dipped in boiling water before being washed.

EX PE'DE HER/CULEM (Lat. [know] Hercules from his foot). A modern Latin proverb, meaning that the whole can be tested by a part. The saying rests on a story told by Aulus Gellius (*Noctes Atticae*, I, 1) on the basis of a work by Plutarch, now lost, that Pythagoras determined the stature of Hercules as follows: Tradition said that the stadium at Olympia measured just 600 times the length of Hercules' foot. Since this stadium was larger than other stadia, which represented 600 times the length of a normal man's foot, it was easy to tell how much larger Hercules' foot was than the normal human foot, and then, on principles of symmetry and mathematics, to determine just how much larger Hercules was than ordinary men. The saying is paralleled by another modern Latin phrase, *Ex ungue leonem*, '[Judge] a lion by his claw.' Similar in spirit, too, is the famous expression of Aeneas about Sinon, in Vergil, *Aeneid*, II, 65-66, *Ab uno disce omnes*, i.e., 'From one [treacherous Greek] know the whole Greek race.'

EXPERIENCE MEETING. A name applied to religious gatherings at which one or more of those present set forth their spiritual history and experiences. In the Methodist church class meetings are of this nature, and some denominations have stated covenant or conference meetings. The ordinary prayer meeting of a church sometimes takes this form.

EXPERIMENTAL PSYCHOLOGY. See PSYCHOLOGY, EXPERIMENTAL.

EXPERT (Lat. *expertus*, skilled, p.p. of *experiri*, to test). One who is specially experienced in a particular subject matter of inquiry, as the result of the previous habit or practice or study. From the legal point of view the most important function of the expert is that of witness in litigated cases.

The earliest recorded appearance of the expert in English judicial tribunals was in the capacity of an adviser of the court. As early as 1353 we are told that, in an appeal of mayhem, the sheriff was ordered to summon skillful surgeons from London to inform the court whether the wound in question was mayhem or not. In the seventeenth century it became customary to call experts as helpers of the jury. When acting in this capacity, they were sworn and examined by counsel as witnesses. At the trial of the Suffolk witches, in 1665, Sir Thomas Browne, the physician and natural philosopher, testified, after examining the accused, that he was of the opinion that they were bewitched. From that time the medical expert has been an important figure in criminal trials. But expert testimony is not confined to members of the learned profession. It may be given by farmers, mechanics, brokers, lumbermen, physicians, clergymen, scientists, lawyers, or any person qualified by special training and knowledge to answer questions requiring such training and knowledge to answer them. (See EVIDENCE.) When the case is before a court and jury, it is for the court to say whether the questions call for expert assistance, as well as whether a particular witness is justified to speak as an expert thereon. It is for the jury to determine the worth of an expert opinion, after it has been given. Such opinion (however famous or learned or experienced the one who utters it may be) is not binding upon the jury. It may be accepted as helpful, or it may be totally disregarded. At times the expert deposes to facts rather than opinions; as when a chemist

explains the examination of an alleged blood stain, or of parts of a human body. When his opinion is called for, it is ordinarily based upon a hypothetical question—i.e., a question which supposes the statements of fact contained in it to have been established by competent evidence. Assuming the facts to be as stated in the question, the expert is asked to tell the jury what, in his opinion, is the correct inference to be drawn from them. It will be observed, therefore, that he is not asked to invade the province of the jury and decide the general question at issue, but only to testify to the specific inference that should be drawn from particular facts.

Whether a person can be compelled to attend and testify as an expert for the fees of an ordinary witness is a question upon which the authorities are conflicting. In England and in many of our States it has been answered in the negative, either by judicial decision or by statute. This view is based upon two considerations: First, that to compel a person to attend as a witness merely because he is accomplished in a particular science, art, or profession, would subject the same individual to be called upon in every cause where his opinion would carry weight. Second, that a person's special knowledge and skill are property, which should be no more at the mercy of the public than the goods of the merchant or the crops of the farmer. On the other hand, the view is maintained that the law allows no excuse for withholding evidence, and that the expert witness, in the performance of his duty as a good citizen, should be compelled to testify where his evidence would be helpful to a court or jury, whether that evidence be based upon personal observation of some fact connected with the case or upon his accumulated knowledge and experience. It is generally agreed, however, that an expert cannot be required to make any special preparation or investigation for the opinion he is supposed to give, without extra compensation.

The usefulness of expert evidence, and the advisability of changing the present methods of procuring and presenting it, are also questions upon which widely different views are entertained. A recent writer upon this subject, a lawyer of high reputation and sound judgment, has declared that "few judges have a good word to say for expert testimony." Lord Campbell once told the House of Lords that expert witnesses "come with a bias on their minds to support the cause in which they are embarked, and hardly any weight should be given to their evidence." Quite recently a learned judge in New York City advised the jury "to put all the expert testimony out of their minds and pay no attention to it." This he did although a week had been consumed in taking the expert testimony, because "an equal number of doctors has testified directly opposite to each other, and all with equal positiveness." On the other hand, the present system has its strong advocates, and no radical change is to be expected in the near future, though there is a growing sentiment in favor of the employment of expert witnesses by the state. Consult: Rogers, *Law of Expert Testimony* (St. Louis, 1891); Lawson, *Law of Expert and Opinion Evidence* (2d ed., Chicago, 1900); Foster, "Expert Testimony, Prevalent Complaints, and Proposed Remedies" (11 *Harvard Law Review*, 169); Endlich, "Proposed Changes in the Law of Expert Testimony" (32 *American Law Review*, 851). See EVIDENCE.

EXPIATION, DAY OF. See ATONEMENT, DAY OF.

EXPLANATION (Lat. *explanatio*, from *explanare*, to explain, from *ex*, out + *planare*, to level, from *planus*, plain). In science, the giving of a complete description of some object or event. In certain cases this end is attained by the subsumption of the phenomenon to a general law, as when a physical fact is brought under one or other of the general laws of mechanics. The law in such instances is mathematically exact; it sums up in shorthand all the conditions under which the phenomenon in question appears; it sets the phenomenon in its right place within the causal nexus of the material universe. In fields of science that are less "exact" than physics, such as biology and psychology, explanation takes on a different form. The laws of these sciences are, for the most part, hypothetical generalizations, or supplementings of the facts more or less hypothetical in character, rather than shorthand formulæ derived from the facts themselves; so that subsumption to them, while it may help to confirm a theory or to classify an otherwise heterogeneous subject matter, does not constitute explanation. Nothing is more erroneous than the popular belief that a given fact is adequately explained when it is referred to a "principle" of heredity or of memory. Explanation consists rather in an accurate description of the fact as observed, together with a statement, as full as the circumstances permit, of the proximate conditions under which it appears. Thus, a fact of mind, a complex mental process, is explained when we have (1) analyzed it into its elements, sensation and affection, (2) formulated the laws of connection of these constituent processes, and (3) referred them to their proximate physical conditions in the cerebral cortex. To explain, e.g., an impulse as a "manifestation of our active nature" or of a "faculty of will," or to account for the rise of an idea in consciousness by a "law of telepathy," is to interpret a fact, a scientific datum, which can be known, in terms of the less known and hypothetical. Misunderstandings of this sort have recently called forth emphatic protest from men of eminence in scientific inquiry. "The business of all science is the description of facts"; and when a scientific "theory" goes beyond the specification of the conditions under which the facts are observable, it ceases to be an aid to thought and becomes a positive hindrance. EXPLOITS' RIVER. A large river in Newfoundland, 160 miles long, rising in the southwest part of the island, which it almost bisects (Map: Newfoundland, E 4). It takes a northeasterly course through the extensive Red Indian Lake and flows into the Bay of Exploits on the northeast coast. The fertile but sparsely settled valley abounds with game, and the river with fish. It is navigable for 12 miles from its mouth by steamers, and small boats ascend within 50 miles of the southwest coast.

EXPLOSION. Explosion is a sudden and violent increase in the volume of a substance, due to the rapid conversion of a solid or liquid

to the gaseous state, or to the instantaneous combination of two or more gases accompanied by increase of volume. Explosion is more rapid than combustion and slower than detonation. See BALLISTICS.

EXPLOSIVES (from Lat. *explosus*, p.p. of *explodere*, to explode, from *ex*, out + *plaudere*, to clap). Substances, either solid or liquid, which, under the influence of some disturbing agency, enter into a chemical reaction which results in the production of gases and the evolution of much heat.

History. Nothing definite is known about the origin of explosives, and it is contended by some that the invention of gunpowder was contemporaneous with the discovery of saltpetre. Greek fire, which is believed to have been a preparation of pitch, resin, saltpetre, and sulphur, was first used during the defense of Constantinople about 660, and it is reasonable to believe that gunpowder was a development of this mixture. Manuscripts are in existence showing the use of gunpowder among the Arabs prior to 1250, but its discovery is generally attributed to Roger Bacon, of Oxford, England, who mentioned it about 1270, and to Berthold Schwartz, of Freiburg, Germany, who described it in 1328. Its discovery has also been attributed to the Chinese, and a description of its use at the siege of Pianking and Lo-yang in 1232 is contained in the Chinese Annals, and its invention has been ascribed to the Hindus in consequence of certain passages in Indian law books, but the authenticity of these Oriental descriptions is doubted by modern writers. In 1346 at the battle of Crécy use was made of cannon (see ARTILLERY; ORDNANCE) in which gunpowder was employed as a propellant, and its use increased with the subsequent development of firearms, though it remained practically the same until the last century. (See GUNPOWDER.) In 1845 Schönbein, of Basel, discovered the explosive nature of gun-cotton, and in 1847 Sobrero discovered nitroglycerin (q.v.). Alfred Nobel invented dynamite (q.v.) in 1866, and to him also is due the production in 1875 of blasting gelatin. The explosive character of nitrated hydrocarbons was indicated by Hermann Sprengel in 1873, and in 1887 it was still further developed by Eugene Turpin, while the now important smokeless powders should be credited to the inventive genius of Vieille, who was the first, in 1886, to produce a really successful military smokeless powder, though previous investigators had been active in this field and had achieved varying degrees of success. See SMOKELESS POWDER.

Classification. Explosives are mechanical mixtures or chemical compounds. The first consist of certain chemical substances intimately mixed by mechanical means, which at an elevated temperature react upon each other and pass into the gaseous state, causing the explosion. Typical of this class is gunpowder. Another example of this class is a mixture of finely divided charcoal and liquid air. A mixture of acetylene and ozone in the liquid state, if it were employed, would constitute one of the most powerful explosives of the same class. A typical example of the second class of explosives is nitroglycerin. Other examples of the second class are gun-cotton, trinitrotoluene, "T. N. T.," and mercury fulminate. The further subdivisions of the two classes of explosives include the following groups: nitrate mixtures, chlorate mixtures, perchlorate mixtures, nitro-

substitution compounds, nitric esters, fulminates, amides, and amines, and triazotates. Another classification in which explosives are divided into "low" explosives and "high" rests on the method by which the explosion is initiated, low explosives being "fired" by ignition and high explosives by detonation. Official classification designates explosives acceptable to the United States as "permissible" and those acceptable in Great Britain as "permitted" explosives. See below.

Theory of Explosions. An explosion may be defined as a chemical reaction which is effected in an exceedingly short space of time with the evolution of a large quantity of gas at a high temperature and accompanied by a shock. When this reaction occurs in a body which is confined, the expansive action of the heated gases produces disruptive effects. The force which is developed by the passage from the solid form to the gaseous condition depends upon the ingredients of the explosive and the way in which the explosion is initiated. When the explosion is progressive, i.e., starts at an initial point and continues from one group of particles to the next, and so on through the explosive, the action is termed *burning* and is analogous to ordinary combustion. When, however, the combustion is effected nearly simultaneously throughout the mass in an extremely short space of time, the action is called *detonation*. The development of a detonation may often be explained as resulting from the transformation of a shock into heat. This may be accomplished by the propagation of the shock from particle to particle in an explosive, or by a shock from one explosive body to another not in direct contact. The latter is the synchronous vibratory theory of Sir Frederick A. Abel, who claims that the originating cause of the detonation of an explosive lies in the synchronism between the vibrations produced by the body that provokes the detonation and those that the first body would produce in detonation, just as the string of a musical instrument resounds at a distance in unison with another vibrating cord. Marcellin P. E. Berthelot, on the other hand, contends that an explosion is due to the transformation of mechanical energy into heat, which during the explosion is again transformed into mechanical energy; i.e., it is dependent upon the production of two orders of waves, one series of which represents the explosive waves developed in the midst of the matter that detonates, and consists of a continually reproduced transformation of the chemical actions into thermal and mechanical actions which transmit equally the sudden pressure all around the centre of the concussion to the adjoining bodies and thence to a new mass of explosive material. Most explosives consist essentially of compounds containing carbon, oxygen, and nitrogen, the last of which is in a state of feeble combination with the whole or part of the oxygen, thus constituting an unstable chemical system. When the explosion takes place, the nitrogen gives up its oxygen to the carbon, for which it has a greater affinity, forming carbon-dioxide and carbon-monoxide gases, the combination being attended by great generation of heat, and the freeing of the nitrogen. In most explosives the carbon is accompanied by hydrogen, which by its combustion produces an extremely high temperature and combines with a part of the oxygen to form water in the state of greatly expanded vapor.

Other subordinate elements are often present; thus, e.g., in gunpowder the potassium holds the nitrogen and oxygen loosely together as saltpetre, and there is sulphur, a second combustible whose oxidation evolves even greater heat than carbon. When potassium chlorate is present, the chlorine acts the same as the nitrogen and is set free in the gaseous state. The foregoing description illustrates those explosives in which the decomposition may be considered a process of oxidation, but there are cases in which an explosion occurs by the simple dissociation of a compound without oxidation; thus, nitrogen chloride and nitrogen iodide contain neither carbon nor oxygen, and their great explosive violence is explained by the feeble affinities of nitrogen for other elements.

Explosive Mixtures of the Nitrates. This class consists of those compounds which are mechanical mixtures of nitrates with some base, such as charcoal or other substance containing carbon, and usually also sulphur. The nitrates are the source of the oxygen which on explosion combines with the carbon of the charcoal, producing large volumes of gases, so that the mixture when confined will at the time of explosion be accompanied by a violent disrupting action. The typical representative of this class is black gunpowder, for a description of the manufacture of which, see GUNPOWDER. The standard composition of gunpowder is potassium nitrate (saltpetre) 75 parts, charcoal 15 parts, and sulphur 10 parts; although these ingredients necessarily vary according to the uses for which the powder is desired, i.e., whether for blasting, sporting, or warfare. They must also be so combined that (1) the combustion may be complete and little residue left after explosion; (2) that the powder shall not readily absorb or retain moisture; (3) that its explosive properties shall not be greater than required; and (4) it shall be hard and dense enough to bear transportation without disintegrating. Excess of carbon and sulphur prevents perfect combustion and lowers the explosive force, while too great an amount of potassium or sodium chloride in the saltpetre will make the powder hygroscopic. Disintegration may be prevented by proper incorporation and pressing. Good gunpowder should have a density between 1.5 and 1.85, and the most acceptable powders for use as propellants are those that are the most dense. Its exploding point ranges from 270° C. for blasting powder, 275° C. for rifle powder, and 315° C. for the best sporting powder.

Among the explosive compounds in this class may be mentioned: *amide powder*, consisting of a mixture of ammonium and potassium nitrates with charcoal; *acotine*, consisting of sodium nitrate 69.04 parts, carbon 15.23 parts, sulphur 11.43 parts, and petroleum, 4.29 parts; *carbo-acotine*, consisting of potassium nitrate 61.04 parts, ferrous sulphate 13.58 parts, soot 24.65 parts, and sulphur 13.58 parts; *diorexine*, consisting of potassium nitrate 50 parts, sodium nitrate 25 parts, sulphur 12 parts, and sawdust from hard wood 13 parts; *johnite*, consisting of potassium nitrate 75 parts, sulphur 10 parts, lignite 19 parts, sodium picrate 3 parts, and potassium chlorate 2 parts; *petralite*, consisting of potassium nitrate 64 parts, impregnated wood or charcoal 30 parts, crude antimony 6 parts; *pyrolite*, consisting of potassium nitrate 51.50 parts, sodium nitrate 16 parts, sulphur 20 parts, sawdust 11 parts, and charcoal 1.50

parts; and *saxifragine*, or *poudre barytique*, a mixture of barium nitrate and charcoal with a small portion of potassium nitrate.

Explosive Mixtures of the Chlorates and Perchlorates. On account of the readiness with which potassium chlorate lends itself to the production of powerful explosives, it has been frequently used by inventors to produce explosive mixtures. It will react with almost any carbonaceous material, and most of its mixtures will readily explode by friction. The tendency of such mixtures to spontaneous ignition, as well as their sensitiveness to percussion, has till recently prevented their extensive adoption. Among the mixtures in this class that may be mentioned are the following: *asphaline*, consisting of potassium chlorate 54 parts, potassium nitrate and sulphate 4 parts, mixed with bran 42 parts; *Thirhard powder*, consisting of a mixture of tannin, powdered nutgalls, or cream of tartar, with potassium chlorate; *Fontaine powder*, consisting of a mixture of potassium chlorate and potassium picrate; *Horseley powder*, consisting of potassium chlorate 6 parts, nutgalls 1 part, and charcoal 1 part, mixed with 72 parts of nitroglycerin (this may also be classed as a dynamite); *Kellow safety powder*, consisting of spent tan and sawdust saturated with potassium or sodium nitrate and a little potassium chlorate, and then mixed with sulphur; *Michalowski blasting powder*, consisting of potassium chlorate 50 parts, manganese dioxide 5 parts, and finely pulverized organic matter, as bran, 45 parts; *Oriental powder*, consisting of potassium nitrate and crude gamboge mixed with potassium chlorate; *pyronome*, consisting of potassium nitrate 69 parts, sulphur 9 parts, charcoal 10 parts, metallic antimony 8 parts, potassium chlorate 5 parts, rye flour 4 parts, and a small quantity of potassium chromate; *rackarock*, consisting of potassium chlorate 79 parts, and mononitrobenzene 21 parts, which are prepared separately and combined only when about to be used; *tutonite*, consisting of potassium chlorate mixed with sulphur and metallic sulphides; and *white powder*, consisting of a mixture of sugar, potassium ferrocyanide, and potassium chlorate. A modern development has resulted in the casting of the grains of the components with a plastic and somewhat elastic cover serving as a cushion and also in substituting perchlorates for chlorates, whereby explosives less sensitive to friction or percussion have been obtained. These were styled cheddites, but there are now several variants.

Explosive Compounds Derived by Nitro-Substitution. This class consists of a series of compounds formed by treating certain hydrocarbons, usually coal-tar products, with nitric acid, thereby producing new chemical compounds which are relatively unstable, and contain elements that are capable of uniting to form stable gases and produce high temperatures in the process of reacting. These explosives accomplish their purpose by a dissociation of the constituent elements of the compound, which then recombine into a variety of gaseous compounds. These explosives are sometimes called "safety explosives" and have considerable economic value, especially for blasting purposes, largely owing to the fact that they give off flames of short duration and have a high rending or expansive force. While used alone for military purposes and in detonating fuse, they are usually, in blasting, made components of mixtures such

as the following: *ammonites*, or *Favier explosives*, consisting of ammonium nitrate 88 parts, mixed into 12 parts of melted dinitronaphthalene; *bellite*, consisting of ammonium nitrate 5 parts, and metadinitrobenzene 1 part, melted together, and potassium nitrate stirred into the mixture; *Borlinetto powder*, consisting of picric acid 10 parts, sodium nitrate 10 parts, and potassium chromate $8\frac{1}{2}$ parts; *extralite*, consisting of a mixture of ammonium nitrate, potassium chlorate, and naphthalene: *joreite*, consisting of varying proportions of nitronaphthalene (8 to 6 parts), nitrophenol (16 to 30 parts), and sodium nitrate (76 to 64 parts); *roburite*, consisting of a mixture of ammonium nitrate and well-purified chlorinated dinitrobenzene; *romite*, consisting of a mixture of ammonium nitrate, potassium chlorate, and naphthalene; *securite*, a mixture of ammonium nitrate and dinitrobenzene; and *Volney powder*, consisting of potassium nitrate, sulphur, and nitronaphthalene. Many of these pass into the Sprengel class and the importance of ammonium nitrate in military explosives is referred to later.

Explosive Compounds of the Nitric Derivatives. This group of explosives consists of nitric esters of cellulose, glycerin, or other hydroxy compounds. In the first case the cellulose is treated with nitric and sulphuric acids, forming *guncotton*, and in the second case glycerin yields, by the action of these acids, *nitroglycerin*. According to the proportions used the mono-, di-, or tri-nitro derivatives of glycerin or a multiple of them for cellulose may be obtained. This class is by far the largest one, and too numerous to admit of a general description, in consequence of which the peculiar properties of each will be described under their special headings. *Guncotton* is an important member of this class. It consists of cellulose such as pure cotton treated with a mixture of nitric acid and sulphuric acid. It is employed chiefly for military purposes and is regarded as very safe. (For a detailed account of its manufacture, and of the various uses to which it is applied, see the article *GUNCOTTON*.) Among the various *guncotton* mixtures, which differ from each other in the proportions of their ingredients and methods of preparation, are the following, which are now seldom used, although valuable on account of their safety: *potentite*, a mixture of 62.2 parts *guncotton* and 33.8 parts potassium nitrate compressed into cartridges; *tonite*, or *cotton powder*, a preparation consisting of 52.5 parts of finely divided or macerated *guncotton* with 47.5 parts of barium nitrate, which is made up into cartridges coated with paraffined paper. A small percentage of fine metallic aluminum is sometimes added to these mixtures to increase the energy of the explosion.

The value of cellulose nitrate as an explosive led to its use in the manufacture of *blasting gelatin*, invented by Nobel in 1875, which is accomplished by dissolving the soluble variety in nitroglycerin. This has been made up into various forms and also combined with absorbents, forming *gelatin dynamites*, which have been used for blasting purposes. In this class should be included *forcite*, consisting of blasting gelatin (nitroglycerin 98 parts, collodion cotton 2 parts) 50 parts and absorbent (sodium nitrate 76 parts, sulphur 3 parts, wood tar 20 parts, wood pulp 1 part) 50 parts; and *gelignite*, consisting of blasting gelatin (nitroglycerin 96 parts, collodion cotton 4 parts) 65 parts, and absorbent

(sodium nitrate 75 parts, sodium carbonate 1 part, wood pulp 24 parts) 35 parts.

Smokeless Powders, representing the latest development of cellulose nitrates as explosives, consist either of one which by the aid of a solvent has been converted into a collodized mass which has been formed into flakes or cords, and dried into a hard hornlike material, or of a powder in which a mixture of cellulose nitrate and nitroglycerin is transformed into a similar hornlike substance either with or without the aid of a solvent. In the first class are the *libel powder*, consisting of a cellulose nitrate brought into the colloidal condition superficially by treatment with ether alcohol; *poudre B* of Vieille, used in France, consisting of cellulose nitrate mixed with barium nitrate, potassium nitrate, and sodium carbonate, and treated with either ether alcohol, ethyl acetate, or acetone; *indurite*, consisting of cellulose nitrate of the highest nitrate collodized and then indurated; and *Wetteren powder*, used in Germany, and consisting of nitrocotton 48.15 parts, guncotton 30.73 parts, charcoal 12.12 parts, volatile matter 8.22 parts, and humus 0.77 part. The foregoing are typical of the military smokeless powders. Sporting powders of similar character are now made, in which the process of manufacture and the proportions of the ingredients are changed to produce the desired results. Of the second class, the most important are: *amberite*, consisting of trinitrocellulose 44 parts, dinitrocellulose 12 parts, and nitroglycerin 40 parts, formed into grains and treated with solvent, consisting of sulphuric ether with a little alcohol; *ballistite*, consisting of *guncotton* 40 parts, dissolved in nitroglycerin 60 parts, to which a small quantity of aniline has been added as a neutralizing agent; *cordite* (q.v.) originally consisting of nitroglycerin 58 parts, *guncotton* 37 parts, vaseline 5 parts, dissolved in 19.2 parts of acetone; *flite* is similar to ballistite and is used in Italy for military purposes. Certain varieties of smokeless powders consist of nitrocellulose combined with nitro derivatives of aromatic hydrocarbons, and included in this class are *Du Pont powder*, consisting of nitrocellulose brought into the colloidal condition by nitrobenzene or other solvent; the last-named powder is of American origin. See **SMOKELESS POWDERS**.

Nitroglycerin. This most powerful explosive, which was discovered by Ascanio Sobrero, in Turin, Italy, 1847, is a colorless or light yellow oily liquid made by passing pure glycerin into a mixture of concentrated nitric acid and sulphuric acid at low temperature. It explodes violently at about 218°C . Its liquid state renders it dangerous in general use as an explosive, though it is still used in this state in oil wells and under analogous conditions. When absorbed with a suitable absorbent, this danger is reduced, and this has given rise to the devising of a very important series of explosives known generically as *dynamites*, which may be again subdivided into two principal groups, viz., dynamites with an inert absorbent or "dope" and dynamites with an active absorbent or "dope." The type of the first group is the original dynamite invented by Nobel in 1866, who used for his absorbent diatomaceous silica, siliceous marl, tripoli, or rotten-stone, commonly called kieselguhr. It is made of various degrees of strength, ranging from nitroglycerin 75 parts and absorbent 25 parts, down to nitroglycerin 30 parts and absorbent 70 parts. Other explo-

sives of this class are *carbodynamite*, consisting of nitroglycerin 90 parts and charcoal made from cork 10 parts, and *cerberite*, consisting of nitroglycerin modified with wood tar and nitrobenzene with charcoal as an absorbent. The second group comprises those dynamites that are composed of nitroglycerin and an active absorbent, usually a nitrate mixture. The following are among the better-known dynamites of this group, the ingredients of which vary in amount according to the special purpose for which they are intended, so that the proportions mentioned are typical of only one variety: *atlas powder*, consisting of nitroglycerin 75 parts, wood fibre 21 parts, sodium nitrate 2 parts, magnesium carbonate 2 parts; *carbonite*, consisting of wood meal 40½ parts, sodium nitrate 34 parts, nitroglycerin 25 parts, and sodium carbonate one-half part; *dualin*, consisting of nitroglycerin 40 parts, sawdust 30 parts, potassium nitrate 20 parts; *giunt powder*, consisting of nitroglycerin 40 parts, sodium nitrate 40 parts, powdered resin 8 parts, kieselguhr 8 parts, sulphur 6 parts; *Hercules powder*, consisting of sodium nitrate 45 parts, nitroglycerin 40 parts, wood pulp 11 parts, sodium chloride 1 part, and magnesium carbonate 1 part; *Judson powder*, consisting of sodium nitrate 64 parts, sulphur 16 parts, cannon coal 15 parts, nitroglycerin 5 parts; *lihofrauteur*, consisting of nitroglycerin 54½ parts, kieselguhr 10¾ parts, barium nitrate 14¾ parts, sulphur 7 parts, manganese 2 parts, soda 2 parts, wood meal 2 parts, bran 1 part; *meganite*, consisting of nitroglycerin 60 parts, sodium nitrate 20 parts, nitrated vegetable ivory 10 parts, nitrated wood 10 parts; *vigorite*, consisting of potassium chlorate 49 parts, nitroglycerin 68 parts, kieselguhr 20 parts, potassium nitrate 7 parts, magnesium carbonate, moisture, etc., 5 parts; and *Vulcan powder*, consisting of sodium nitrate 52.5 parts, nitroglycerin 30 parts, charcoal 10.5 parts, and sulphur 7 parts. Mixtures to meet special conditions in mining are now compounded. Short-flame, cool explosives are especially desired in coal mining.

One of the objections to nitroglycerin as well as to the dynamite formed from it has been the freezing at low temperatures and the danger of explosion when thawing it. This is now obviated in large degree by the use of dinitroglycerin, nitro-substitution compounds, and other chemicals in the mixtures. These are styled L. F. dynamites.

Sprengel Explosives and Panclastites. In 1873 Dr. Hermann Sprengel described a class of explosives consisting of two inexplorative ingredients, which, when mixed together, yielded a compound capable of violent detonation. The safety with which the components of explosives could be transported to the place of action and compounded on the spot led to their study by the experts on explosives of various governments, and a number of valuable preparations of this class have since been patented in different countries. A number of these, such as *rackarock*, have already been described under *Explosive Mixtures of the Chlorates*, and *ammonites*, *bellite*, *reburite*, *romite*, and *securite* under *Explosive Compounds Derived by Nitro Substitution*. In addition to these there should be mentioned *hellhoffite*, consisting of nitric acid with a specific gravity of 1.5, 53 parts, and metadinitrobenzene 47 parts; and *panclastite*, consisting of nitroteroxide combined with some combustible substance, such as a hydrocarbon, vegetable, animal, and mineral

oils, fats, and their derivatives, but preferably with carbon disulphide. In this class may be included the picric acid compounds, which consist of trinitrophenol or picric acid brought into a dense state by fusion and used as a filler for shells. This explosive, differing only in the details of its manufacture, which are kept secret by the respective governments, is called *lyddite* in England and *melinite* in France. The ammoniation of picric acid gives *ammonium picrate*, a compound less sensitive and less likely to form sensitive salts with metals. It is used as an explosive charge of armor-piercing projectiles.

Fulminates and Amides. The fact that certain nitrates, when heated with alcohol and an excess of nitric acid, yield peculiar crystalline, easily detonating precipitates, has been known for more than a century, and this property has been taken advantage of in the preparation of explosives. The best-known member of this class is the *mercury fulminate*, which is made by dissolving mercury in nitric acid, which solution, when cool, is added to alcohol. The gray explosive mercury fulminate is formed as a precipitate by reaction between them. The precipitate is then carefully washed and air-dried. It is exceedingly sensitive to heat and shock of any kind, and may be detonated by heat at a temperature variously given from 149° C. to 200° C. The *silver fulminate*, which is formed by heating an aqueous solution of silver nitrate with strong nitric acid and alcohol, is similar. Mercury fulminate finds an extensive application in detonators for gun-cotton and nitroglycerin compounds; also in percussion caps and primers.

Military Uses of Explosives. In times of peace the principal use of explosives is in mining and engineering enterprises. In the military and naval services, as well as in sporting rifles, they are employed as propelling and as bursting charges for projectiles. An explosive for use as a *propelling* charge in a gun should give in that gun as low maximum pressures and as high projectile velocity as possible. The older powders were finely pulverized. About 1860 and later it was customary to press the powder mixture into a cake, that was afterward broken between rollers into irregular grains which were sorted by screens into different sizes—musket, mortar, cannon, and mammoth; the latter from 0.6 inch to 0.9 inch. At this date (1860) General Rodman proposed cylindrical cakes nearly the diameter of the bore and 3 inches long, pierced by ¼-inch holes ¾ inch apart, reasoning that the burning on the inner surfaces of these holes would give a constantly increasing surface, and therefore an increasing rate of generation of gas—a condition which he recognized to be desirable. At the time this form was

BLACK POWDER.

not deemed preferable to the mammoth, and his principle was adopted only after a number of years, and was preceded by the use of other powders—as the spherohexagonal—molded simply

for uniformity of size. His grain when adopted was modified to a hexagonal prism about 1 inch long and wide, pierced by one or several holes.

About 1882 the Germans introduced "brown" or "cocoa" powder in the same form grains, but using charcoal not so much baked and therefore giving a slower powder. A "slow-burning" cocoa powder soon came forward as an improvement. Long-continued efforts were made to get a powder of more power per unit of volume, which would give in the reduced-calibre small arm a higher velocity than gunpowder, with permissible pressures. The high explosives were tried, especially cellulose nitrate, in many forms, pressed and mixed with other substances, but with resulting high pressures and detonations, until, about

BROWN OR COCOA POWDER.
Hexagonal pierced prism grain.

1884, dissolved cellulose nitrate gave after evaporation of the solvent a horny mass, which burned regularly without detonation. Similar treatment of combinations of cellulose nitrates and nitroglycerin gave similar results. It had been known that these explosives gave no smoke, their products being gaseous, but it was the desire for more power which brought them into use. The French quickly recognized the value of smokelessness as well as of power and soon extended the

use of the poudre B of this class to all their cannon. The Germans used Wetzteren, and later ballistite. The English later adopted cordite. Of

these four powders the first two are made of cellulose nitrates and the others of this and nitroglycerin. In the United States it was not until well after 1890 that smokeless powders were adopted; for, although their advantages were recognized and many kinds experimented with, a later and more advanced stage of development was awaited. The navy adopted smokeless powder earlier than the army did. Cellulose nitrate powders are most generally used in the United States. The forms of grain are many—

long cords, spaghetti-like tubes, thin flakes,

cubes, pierced prisms (generally for large guns), and others. American smokeless powder and its manufacture had reached such a stage of development that when the United States entered the World War in 1917, but little change in product or methods of manufacture save in details were required. Following the example of Germany it was determined to use cellulose produced from wood pulp in place of cotton.

A water-drying process was developed during the World War which materially reduced the time of drying and also an alcoholic drying process, which in addition gave a better grade of powder.

CORDITE.

(Outline shows original form.)

For many years the bursting charges of shell consisted of a fine-grain black powder. Seeking a more destructive effect, experiments were made in Germany and in Italy between 1880 and 1890 with shell loaded with guncotton and other high explosives fired from common guns. These trials met with partial success, and for a number of years prior to the World War experiments in firing recent improved high explosives from common guns were in progress. Lyddite (used by the English), melinite (used by the French since 1887), explosives in which picric acid figured were used in the World War while before that time thorite, joveite, etc., had been tried by the United States. The Japanese Shimose was melinite in the form of a practically pure picric acid. Special shells in the earlier days were loaded with numerous separated

compartments. The intent was to keep the charge from explosion from the shock produced by the settling down of a long column of powder upon discharge, without interfering with complete detonation upon impact. The Gathman system comprised a large shell carrying wet and dry gun cotton carefully packed and fired with a special fuse. The charge was expected to explode against the side of a vessel with such force as to burst in her armored sides. Tests made in 1901-02 failed to demonstrate the success of the system, and it was officially decided to discontinue further experiments.

Meanwhile maxinite and explosive "D," ammonium picrate, had been developed which could be fired safely in armor-piercing projectiles through an 11½-inch plate of best modern Krupp face-hardened armor and detonated on the inside with most destructive effect by a delay-action fuse. Explosive "D" was used by the United States Army as the bursting charge of shells of 10-inch caliber and more in the World War, and it figured extensively on the programme of explosives.

During the World War the United States Ordnance Department developed a standard policy for the use of high explosives. Trinitrotoluol or T. N. T. was selected for shell between and including the caliber of 75 millimeters and 4.7 inches; Amatol for shell calibers between 4.7 inches and 9.2 inches, including the latter; and ammonium picrate, or explosive "D," for shells of 10-inch caliber and higher. This conserved the T. N. T. supply.

In the World War T. N. T. or trinitrotoluol was the high explosive used as a bursting charge in the leading armies. It was adopted in the United States as stated for shells between and including the calibers of 75 millimeters and 4.7 inches, and, in combination with ammonium nitrate, for amatol for larger caliber shells. T. N. T. was made as early as 1880, and its manufacture was started in Germany in 1891. In 1902 the Germans adopted T. N. T. for filling shell and other purposes, and in 1907 it was also adopted by Italy under the name of tritolo and by Russia soon afterwards. In the British service trinitrotoluol received its familiar name of T. N. T., and it is also known as trotyl. Other names for it are trinitol and trilit. In the manufacture of T. N. T. toluol is the basic raw material and ordinarily is secured from by-product coke ovens. During the World War methods were developed whereby toluol also could be obtained by the stripping or absorbing of it from carbureted water and coal gas, and by the breaking down or cracking of oils. All of these methods were employed extensively in the United States during the war, and for the last named three special operations were developed for treating petroleum distillate or naphtha. In the United States three grades of T. N. T. were produced: Grade I, used for booster charges, that is, those charges which initiate the explosive wave in the main-shell charge; Grade II was used as a shell filler, while Grade III was employed with ammonium nitrate in the production of amatol.

Amatol was a high explosive developed by the British during the war and consisted of a mixture of trinitrotoluol—T. N. T.—and ammonium nitrate. In the United States ammunition programme amatol was employed for shells of caliber between 4.7 and 9.2 inches, including the latter, and was particularly useful as it

was less expensive to prepare than T. N. T. alone, and at the same time there were available considerable supplies of ammonium nitrate. Ammonal, a similar mixture, was used by the Austrians.

Ammonium nitrate was used principally with T. N. T. in the manufacture of amatol, and is manufactured by neutralizing nitric acid by ammonia, the resulting product being a crystal which is available as a high explosive. During the war new processes were developed in England for the production of ammonium nitrate and the commercial resources of the United States for such production were vastly increased. In the Scandinavian countries ammonium nitrate is manufactured from nitric acid made by the fixation process possible by the cheap water power. It was to obtain adequate supplies of ammonia that the large nitrogen fixation plants were developed during the war, and special ammonium nitrate fixation plants were built by the United States government.

Tetryl, used by the French and English as a bursting charge for shell during the World War, was more sensitive than T. N. T. and had a high rate of denotation, but in the United States was employed only as a loading charge for boosters. There was the further objection of its high cost and lack of manufacturing facilities for its production. T. N. A. or tetranitroaniline, an explosive for the loading of boosters and fuses, was employed by the Russian government, being manufactured in the United States. It was, however, adopted for the United States service. Lyconite was developed by the Du Pont Company and authorized by the United States Army for use in the loading of drop bombs. Anilite was a liquid explosive used by the French, but improved so as to render it safer. It had not been adopted by the United States Army prior to the Armistice.

Nitrostarch was an explosive which had been under development in the United States for commercial purposes prior to the war, but with limited success. However, after further experiments and investigation, several nitrostarch explosives were adopted by the United States Army for filling hand and rifle grenades, trench mortar shells and drop bombs. The advantage of this material was the ease of loading, the use of materials generally available and their low cost. During the war there were loaded with nitrostarch explosive 7,244,569 defensive hand grenades, 1,526,000 offensive hand grenades, 9,921,533 rifle grenades and 813,073 3-inch trench-mortar shells. The average monthly production of nitrostarch by November, 1918, was 1,720,000 pounds, and a nitrostarch explosive known as *grenite* was tested and authorized for use during the war.

Manufacture of Explosives in the United States. The manufacture of explosives is now one of the most important of the chemical industries in the United States. Its growth, as will be seen from the accompanying table from successive census reports, has been most rapid, and the 118 establishments manufacturing explosives in 1919 were located in 24 different States and had a total production valued at \$92,474,813. In addition there were factories belonging to the government. That the production of explosives in the United States is not entirely for domestic consumption is shown by the fact that the exports of gunpowder in the year 1920 amounted to 43,007,793 pounds, valued at \$38,368,157;

those of dynamite amounted to 15,641,981 pounds valued at \$3,210,481 and all other explosives were valued at \$2,381,479, so that including cartridges, shells and projectiles loaded, and fuses, the total exports of explosives aggregated in value \$56,846,698 for the year.

TOTAL PRODUCTION AND VALUE OF EXPLOSIVES, BY DECADES: 1840 TO 1919

YEAR	Number of establishments	Capital	Average number of wage earners	PRODUCTS	
				Pounds	Value
1840	137	\$975,875	496	8,977,348	..
1850..	54	1,170,223	579	..	\$1,590,332

1909†	88	50,167,976	6,274	487,481,252	37,983,8681
1914‡	111	71,351,414	6,306	481,752,040	41,432,970**
1919§	118	133,247,684	9,249	..	92,474,813

* This value is for the explosive substances only. When materials of all kinds produced in these establishments are included, the value is \$17,125,918.

† Thirteenth United States census, 1910, 124 plants were represented.

‡ In addition 1,471,042 pounds, valued at \$656,969, were made by Federal establishments and 219,356 pounds, valued at \$135,979, were made by establishments engaged primarily in the manufacture of "firearms and ammunition."

§ Census of manufacture.

* In addition 5,072,387 pounds, to the value of \$1,632,335, were made by Federal establishments, comprising 4,998,537 pounds of smokeless powder and 73,850 pounds of other explosives.

The outbreak of the World War in 1914, naturally gave a great impetus to the explosives industry in the United States as considerable quantities were manufactured for export to the belligerent nations. The result was that the interval prior to the entrance of the United States into the war was one of considerable growth and expansion, so that in 1917 when America joined the Allies her private works were in readiness for increased production while government or government aided plants were planned and built on a vast scale, many of which came into production before the Armistice was declared. Manufacturing facilities were developed on such a scale that during the nineteen months the United States was engaged in the war American powder plants produced 632,504,000 pounds of propellants as compared with 342,155,000 for France and 291,706,000 for Great Britain. At the signing of the Armistice there were on hand approximately 200,000,000 pounds of smokeless powder and 6,850,000 pounds of black powder. The American production of ammonium nitrate from all sources at the time of the signing of the Armistice was 20,000,000 pounds a month. The production of picric acid in November, 1918, amounted to 11,300,000 pounds, while the average monthly production of ammonium picrate had increased to 950,000 pounds.

In the same space of time the United States produced 375,656,000 pounds of high explosives for loading into shells as compared with 65,110,000 pounds for England and 702,964,000 pounds for France for the same period. At the time of the Armistice the United States had a monthly capacity for manufacturing propellants of 42,775,000 pounds as compared with 17,311,000 pounds for France and 12,055,000 for England. During the war the United States developed 53 new plants for making explosives and propellants

and loading them at a cost of approximately \$260,000,000. In August, 1914, the American production of trinitrotoluol for commercial purposes amounted to approximately 600,000 pounds a month, mostly used for making explosives for blasting. By April, 1917, this production had been increased to 1,000,000 pounds a month, exclusive of that which was being used commercially, and by November, 1918, the production had been developed to 16,000,000 pounds a month, two government plants being in course of erection, one with a capacity of 4,000,000 pounds a month, the other with 2,000,000 pounds a month.

The production of explosives in the United States for the calendar year 1920, including exports, amounted to 537,954,750 pounds of which 254,879,825 pounds, or 47 per cent, was black blasting powder; 229,112,084 pounds, or 43 per cent was high explosives other than permissible explosives, and 53,062,841 pounds, or 10 per cent, was permissible explosives. The amount of permissible explosives sold in 1920 was never before equalled, and sales of black powder were with one exception for 1917 higher than for any other year.

Naturally the mining industry consumed the greater part of the explosives, taking 75.1 per cent of the total in 1920. The principal increase was in coal mines, an industry that ordinarily takes over 80 per cent each of all black powder and permissible explosives and about 15 per cent of high explosives, over one half of these three classes combined.

The amount of explosives exported from the United States in the year 1920, aggregated in value \$56,846,698. In 1919, the total value of explosives exported were valued at \$28,399,707; while in 1918 exports were \$243,528,539; in 1917, \$639,934,405; in 1916, \$715,575,306; in 1915, \$188,969,893; in 1914, \$10,037,587, and in 1913, \$5,525,077.

Commercial Explosives Used in Engineering and Mining Operations. The manufacturers of commercial explosives have developed a wide range of products so that for almost every kind of operation requiring its use in engineering or mining a suitable explosive is available. See **BLASTING**. Naturally there is a wide diversity in their use and in the various explosives appropriate for such uses. For example, many explosives that can be employed for work cannot be used in deep mines or in close workings, while in such work as metal mining and in driving tunnels it is necessary also to consider the character of the gases evolved on detonation. In coal mines, too, especially those that are gaseous or dusty, an explosive must be employed where the flame temperature and the height and duration of the flame are sufficiently reduced to permit of safe working. If the blasting is carried on under conditions of dampness or in water, a special explosive must be sought which is impervious to moisture, while for use in cold climates it is desirable to use explosives that do not require thawing if they are satisfactory in other respects. On the other hand in the tropics care must be taken that the explosives selected are not liable to change in their chemical or physical characteristics or to other deterioration.

In open-air work, such as breaking down rock in quarries, the explosives more generally employed are black blasting powder, granulated nitroglycerin powder, containing from 5 to 15 per cent of nitroglycerin, "nitroglycerin dynamites" containing 15 to 60 per cent of nitro-

glycerin, low-freezing dynamites, sold on a basis of the equivalent percentage of the strength of the "straight" nitrodynamites, and also ammonia nitrodynamites, which the explosive industry rates in a similar commercial manner. Coal miners in their blasting also employ blasting gelatin, gelatin dynamite, ammonium nitrate powders, containing nitro substitution powders, chlorate powders, and the so-called nitro-starch powders.

In mining and tunneling some of the foregoing explosives would not be suitable as they do not develop the requisite disruptive force, and in many cases produce poisonous gases which affect the atmosphere of the working place. There is also an economic reason, namely, that it is more economical in tunnel work to drill a few holes and to load them with a more powerful explosive of greater disruptive force than to drill a large number of holes and to employ weaker and cheaper explosives. Accordingly there has been found that two main classes of explosives develop the necessary disruptive force required in blasting hard rock in metal mining and tunneling. These are "straight" nitroglycerin dynamites and gelatin dynamites which are specially made from formulas that provide a requisite amount of oxygen by supplying a decreased percentage of combustible materials. In a gaseous or dusty coal mine it is also found necessary, in addition to securing the requisite qualities of strength and efficiency to break down the coal, that there should be a relatively short flame of relatively low temperature. Accordingly, what are known as permissible explosives, referred to in the following paragraph, have been developed and are now used in every coal mining state in the Union. These are thoroughly tested by the United States Bureau of Mines at its Pittsburgh testing station, where there is a large steel cylinder or gallery which can be filled with fire damp or coal dust and air.

Permissible Explosives in the United States are blasting explosives that, having passed certain tests prescribed by the United States Bureau of Mines, are considered suitable for use in gaseous or dusty coal mines, when used in the manner prescribed by the bureau. The chief characteristics that an explosive must possess in order to pass the tests are: (1) Relatively low temperature resulting on explosion, (2) a minimum amount of explosion flame. Mixtures of natural gas and air are exploded when exposed to a temperature of about 650° C. for about one-tenth of a second, but are not acted upon by flame of much higher temperature if the flame is of sufficiently short duration. Thus, although the flame temperature of most permissible explosives lies between 1500° and 2000° C., they do not ignite the most explosive mixtures of gas and air because of the rapidity of their explosion, the duration of their flame being only about two to five ten-thousandths of a second. Black powder, on the other hand, has a flame temperature of over 2200° C., and a duration of flame, under the same conditions of test, of approximately one second. Ordinary 40 per cent nitroglycerin dynamite gives a flame duration of only about four ten-thousandths of a second, but its flame temperature is about 2900 degrees. Both black powder and dynamite, then, fail to pass the tests for permissibility, black powder because of the long duration of its flame, and dynamite because of the high temperature of its flame. The problem in producing permissible explosives is therefore to formulate

explosive mixtures such that, while giving a minimum amount of flame of short duration and low temperature, they will develop sufficient energy to do the work of breaking down coal in an economical manner. An example is cited below: By proper additions of various ingredients, ordinary dynamite can be so altered in composition that its flame temperature will be reduced sufficiently to render the resulting explosive "permissible." If, for example, a large excess of carbonaceous combustible material, such as wood pulp, flour or corn meal, is added, the gaseous products of explosion are so altered that the flame temperature is greatly reduced. The same effect is obtained by the addition of water, either in the liquid state, in which form it is absorbed by the other ingredients of the explosive, or in the form of water of crystallization in such crystalline salts as alum, or magnesium sulphate, both of which contain about 50 per cent of water of crystallization. Similarly, the addition of inert solid matter, such as clay of powdered rock, which simply absorbs part of the heat liberated by the explosive reaction, or of readily volatile inert material such as certain ammonium salts, which consume heat in being volatilized, will also produce the characteristics of permissible explosives. Although such additions naturally lower the strength of the explosive, it is possible to obtain the desired end and still produce explosives entirely suitable for use in coal mining, as is evidenced by the fact that there were on June 1, 1921, 154 explosives on the "permissible list." Careful chemical analyses are made of every explosive received for test, in order to determine whether the explosive possesses any objectionable chemical features. Field samples, collected from time to time, are also analyzed in order to ascertain whether the different permissible explosives are being manufactured in accordance with the composition of the original sample submitted for test. The difficulties encountered by the chemist in analyzing such explosives may be realized when it is known the manufacturers use a great variety of ingredients in bringing about the desired results. About 60 to 70 ingredients have been found in the various permissible explosives analyzed in the bureau laboratory.

Permitted Explosives. The term applied by the English Government to explosives authorized for use in coal mining after they have successfully passed the test prescribed by His Majesty's Inspectors of Explosives, by which to fix their degree of safety and the best conditions for use.

Transportation and Storage of Explosives. Under Act of March 4, 1909, and Section 15 of the Act to Regulate Commerce as amended June 18, 1910, the transportation of explosives in the United States is forbidden except under conditions prescribed by the Interstate Commerce Commission, which has since then from time to time formulated regulations under the advice of the Bureau for the Safe Transportation of Explosives and other Dangerous Articles of the American Railway Association, to which it has delegated power of inspection and investigation. For transportation purposes explosives are divided into "forbidden explosives," such as liquid nitroglycerin, and "acceptable explosives," such as gunpowder and dynamite containing 60 or less per cent of nitroglycerin.

The storage of explosives is regulated by State and municipal laws and ordinances which relate usually to the kind and location of magazines

and particularly their nearness to highways and habitations. In the years immediately preceding the entrance of the United States into the Great War there were a number of serious disasters due to explosions at factories and elsewhere. In these criminal intent as well as accidental causes figured, and accordingly it was found necessary to pass a "Federal Explosives Act." This was approved Oct. 6, 1917, and aimed to prohibit any manufacture, distribution, storage, use and possession in time of war of explosives, and at the same time provided regulation for the safe manufacture, distribution, storage, use and possession, and in other ways aimed to protect the country and the public generally. This involved a system of local licenses administered by the Bureau of Mines through various local agencies. Under this act such matters as improper storage, thefts from magazines, bomb outrages, magazine construction, transportation and general care in handling were dealt with in an efficient and effective manner. After the Armistice, however, the regulations established were gradually revoked, so that by 1920 there was no federal supervision and control of explosives, except in interstate commerce. It was felt, however, that peace-time legislation in this field was desirable, giving to the Bureau of Mines a general supervision of explosives and the investigation of accidents.

Literature. The monographs of the leading experts, such as Abel of England, Berthelot of France, Munroe of the United States, and Von Lenck of Austria, form valuable sources of information, in addition to which consult the following more significant modern works: Munroe and Hall, *A Primer on Explosives for Coal Miners* (Washington, 1909); id., *A Primer on Explosives for Metal Miners and Quarrymen* (Washington, 1915); Hall and Howell, *The Selection of Explosives Used in Engineering and Mining Operations* (Washington, 1914); Weaver, *Notes on Military Explosives* (4th ed., New York, 1917); Brunswick, *Explosives*, trans. and annotated by Charles E. Munroe and Alton L. Kibler (New York, 1912); Cundill, *A Dictionary of Explosives* (rev. ed. by J. H. Thompson, London, 1895); Guttman, *Blasting: A Handbook for the Use of Engineers and Others Engaging in Mining, Tunneling, Quarrying, etc.* (Philadelphia, 1892); Berthelot, *Explosives and their Power*, trans. from the French by Napier Hooke and William MacNab (London, 1892); Eissler, *The Modern High Explosives* (New York, 1893; later ed., London, 1897); Munroe, *index to the Literature of Explosives*, parts i and ii (Baltimore, 1893); Guttman, *The Manufacture of Explosives: A Theoretical and Practical Treatise on the History, the Physical and Chemical Properties, and the Manufacture of Explosives*, with full bibliography of the subject from 1468 to 1895 (2 vols., London, 1895); Walke, *Lectures on Explosives* (New York, 1897); De Kalb, *Manual of Explosives* (Toronto, 1900); A. Marshall, *Explosives, Their Manufacture, Properties, Test and History* (London, 1917); id., *Explosives* (Philadelphia, 1917); Z. de W. S. Colver, *High Explosives* (London and New York, 1918); J. A. Marshall, *The Manufacture and Testing of Military Explosives* (New York, 1919); R. C. Farmer, *The Manufacture and Uses of Explosives* (London, 1921); S. I. Levy, *Modern Explosives* (London, 1920); G. C. Smith, *T. N. T., Trinitrotoluenes, etc.* (New York, 1918). Various reports during and sub-

sequent to the World War were issued by the Ordnance Departments of the U. S. Army and Navy, some of which are generally available. See GUNPOWDER; GUNCOTTON; DYNAMITE; NITROGLYCERIN; ARTILLERY; BALLISTICS; ORDNANCE; SMOKELESS POWDERS; TRINITROTOLUENES.

EXPONENT and EXPONENTIAL (from Lat. *exponere*, to set forth, from *ex*, out + *ponere*, to put). An exponent, in the primitive sense, is a number symbol which shows how many equal factors enter into a power; e.g., in 2^3 , 3 is the exponent of 2; in a^5 , 5 is the exponent of a . The exponent affects only the letter or number adjacent to which it stands, ab^3 meaning $abbb$. While the various forms and the theory of exponents have been matters of growth, the notation as now used was introduced into algebra by the mathematicians of the seventeenth century. Chuquet (1484) had used exponents, but not with the same significance as at present, and a step towards the theory of the subject, including the use of fractional exponents, had long before been made by Oresme (fourteenth century). Kepler (1619) speaks of Bürgi as having written for x , x^2 , x^3 , x^4 , ... 1R. 1., 1c, 1zz... whereas he himself prefers 1, 1¹, 1², 1³, ... Bürgi, however, wrote $\frac{1}{16}$ for $16x^2$, and $\frac{1}{20}$ for $20x^4$. Harriot (q.v.) wrote x^2 for xx , x^3 for xxx . Wallis (1656) explained the expressions x^{-n} and $x^{\frac{1}{n}}$ as indicating the same as $\frac{1}{x^n}$ and $\sqrt[n]{x}$. The theory of exponents has gradually received extensions until it has become an important division of algebra. The following equations show the meanings of various exponents:

$$a^0 = 1, a^1 = a; a^{-2} = \frac{1}{a^2}; a^{-n} = \frac{1}{a^n};$$

$$a^{\frac{1}{2}} = \sqrt{a}; a^{\frac{1}{n}} = \sqrt[n]{a}; a^{\frac{2}{3}} = \sqrt[3]{a^2}.$$

The fundamental laws of exponents in algebra are:

$$a^m \cdot a^n \equiv a^{m+n}; a^m : a^n \equiv a^{m-n};$$

$$(a^m)^n \equiv a^{mn}; (ab)^n \equiv a^n b^n;$$

for all values of m and n . These operations are subject to the associative law (q.v.), $a^{m+n+p} = a^{(m+n)+p}$; to the commutative law, $a^{m+n+p} = a^{p+n+m}$, and to the distributive law, $a^{(m+n)p} = a^{mp+np}$. In quaternions (q.v.) and certain other branches of modern mathematics the conventions as to exponents differ.

Functions in which the variable or variables are involved as exponents are called exponential functions; e.g., $a^x = c$, $x^2 = b$, $2^x = 8$. In the last example x evidently equals 3. When such equations cannot be solved by factoring, it is best to apply logarithms (q.v.). Thus, in $2^x = 80$, $x \cdot \log 2 = \log 80$, and $x = \frac{\log 80}{\log 2} = 6.322$.

The series $e^x = 1 + x + \frac{x^2}{1 \cdot 2} + \frac{x^3}{1 \cdot 2 \cdot 3} + \frac{x^4}{1 \cdot 2 \cdot 3 \cdot 4} + \dots$ is called the exponential series. If x is taken as 1, the series gives $e = 2.718281828 \dots$, the base of the hyperbolic logarithms (q.v.).

EXPOSITION. See EXHIBITIONS, INDUSTRIAL.

EXPOSITION OF THE SACRAMENT. In the Roman Catholic service, the public exhibition of the Holy Sacrament, instituted with certain ceremonies for the veneration of the faithful. As early as the thirteenth century the

Sacrament was thus exposed at least on Corpus Christi; but not until the sixteenth century did it become customary to expose the Host at other times, as on occasions of public distress, when it is said to have been introduced by a Capuchin of Milan, Father Joseph, who died in 1556. The practice is still in use of placing the Host within the monstrance above the altar and appointing persons to relieve each other night and day in watching and praying for a period of 40 hours. On the second day a mass "for peace" is sung, and it is again placed in the tabernacle after a high mass (that of deposition) has been sung. The exposition is not allowed without leave from the Bishop or without an apostolic indult. Usually no mass is celebrated at the altar during the exposition; the bells are not rung at masses said at other altars. Consult Maier, *Die liturgische Behandlung des Allerheiligsten ausser dem Opfer der heiligen Messe* (Ratisbon, 1860), and Raible, *Der Tabernakel einst und jetzt* (Freiburg, 1908).

EX POST FACTO (Lat., from what is done afterward). A legal term, designating something as done after or arising from or affecting another thing that was committed before. In this broad sense it is applied to the acceptance of an estate by the grantee in a deed, conveying it to him, which estate he had the right to reject or accept. It is also applied to every act of a legislative body, or of a court, having a retroactive effect. The term is most frequently used, however, in a narrower and more technical sense. This is due to certain provisions of our Federal and State constitutions, prohibiting the enactment of ex post facto laws. The term in this connection does not embrace retrospective laws in general, but is confined to laws of a criminal or penal nature. Hence, a statute setting aside a decree of the court of probate rejecting a will and directing a new hearing before the court is not within this constitutional prohibition, however repugnant it may be to the principles of sound legislation. In order to come within the prohibition, the law must render an act punishable, as a crime which was not so when the act was committed or punishable, in a manner in which it was not punishable when it was committed. It is not necessary, however, that the punishment be of a strictly criminal character. A law which excluded a minister of the gospel from the exercise of his clerical functions and a lawyer from practice in the courts unless he would take an oath that he had not engaged in or encouraged armed hostilities against the government of the United States, was declared by the United States Supreme Court to be ex post facto because it punished in a manner not before punishable by law offenses committed before its passage, and because it instituted a new rule of evidence in aid of conviction. On the other hand, a statute is not ex post facto which mitigates instead of increasing punishment, or which changes the rules of evidence or procedure in matters of detail without impairing any substantial right which the law gave the accused at the time when his alleged criminal act was done. In conclusion, it should be remembered that the constitutional provisions in question have always received a liberal construction, with the view of giving full effect to this avowed purpose of protecting the individual right of life and liberty against hostile retrospective legislation. Consult Cooley, *The General Principles of Constitutional Law in*

the United States (3d ed., Boston, 1900), and *Kringo v. State of Missouri*, 107 United States, 221.

EXPRESS COMPANY. An enterprise which undertakes the transfer of parcels too small or too valuable, or too greatly in need of prompt transmission, to be intrusted directly to the ordinary agencies of transportation. The express company commonly arranges for the collection and the safe delivery of parcels, and their insurance against loss; it may also attend to the collection of their price upon delivery, etc. In the course of their history the express companies became early a chief agency for the transmission of specie and other currency from one financial centre to another. Out of such operations developed a financial branch, including the sale of exchange, the issue of traveler's checks, etc., only loosely allied to the proper field of the express company. The ubiquity of the express service and its responsible financial standing have led to the assumption of yet more remote functions, such as the transfer and placing on record of legal instruments of various kinds.

The express business in the United States came into existence shortly after the appearance of the railway. The earliest-known express service was organized in 1836 by Charles Davenport and N. S. Mason, to operate over the Boston and Taunton Railway. In 1839 William Harnden organized an express service, to operate over railway and steamship lines between New York and Boston. The business grew rapidly in importance, and was extended to transportation between the United States and European countries. Harnden's success excited competition, and in 1840 Alvin Adams organized an express service between New York and New England points. In 1854 Harnden and Adams, with two smaller concerns, joined to establish the Adams Express Company. The American Express Company had already been established, in 1850; and the Wells, Fargo & Co. in 1852, the latter company undertaking especially the lucrative and dangerous business by stage and express riders to the Pacific coast. In 1854 the United States Express was founded, to operate chiefly in the Middle West; the Pacific Express, for southwestern business, in 1879; the Southern Express in 1886, to serve the South east of the Mississippi. Many other companies have been organized, but the ones mentioned include all those that maintained a strong position down to 1912.

The earliest official statistics for all express companies date from 1890. In that year 18 companies were enumerated, operating over a mileage (steam railroads, water lines, and stage lines) of 174,059. The number of employees was 45,718, and the value of equipment owned by the companies was \$4,598,567. The gross expenditures exceeded \$45,000,000. Receipts were not recorded by the census. In 1907 the number of companies had increased to 34; their operating mileage to 235,903; number of employees to 79,284; value of equipment to \$14,014,960; and gross expenses to \$115,633,204. The gross receipts amounted to \$128,117,176.

The relative magnitude of the four leading express companies is fairly indicated by the following figures for net capital and gross receipts from operation (1912). For the Adams Express the figures are respectively \$7,580,813 and \$34,191,955; for the American, \$9,058,377

and \$43,714,874; for the United States Express, \$3,948,399 and \$21,131,508; and for the Wells, Fargo, \$6,227,987 and \$32,465,970.

In the early history of the express companies it was not unusual for them to secure cars from the railway companies, paying for their use on a time and haulage basis. With the growth of the business the arrangements between railways and express companies assumed the form of a division of the receipts, the railway company stipulating that express rates should be fixed at a level calculated to preclude direct competition with the freight service. While no uniformity exists in the division of receipts, it has been customary for railway companies to exact 40 per cent of the express receipts for their service of haulage. Where agents of the railway company perform services in hauling express matter, or where the railway stores express matter in its buildings, the share of the railway company in the express receipts may exceed 40 per cent very considerably.

Prior to the Interstate Commerce Act of 1906 the express companies were independent of Federal supervision and control, and fixed rates solely with a view to the general competitive situation. The Act of 1906 extended the jurisdiction of the Interstate Commerce Commission to the express companies. Under authority of the Act the commission prepared forms for annual reports from the companies, which have been published since 1909, and, after thorough examination of the structure of express rates, issued an order, to take effect Feb. 1, 1914, prescribing a new and lower schedule of rates, based upon a zone system.

The natural field of the express service in America lies between the freight service on the one hand and the postal service on the other. By their contracts with the railways the express companies are protected against serious competition from the freight service. Competition with the postal service made its first appearance about 1845, when the express companies conducted a letter express, by which letters were carried for one-quarter of the postal charge. Mr. Wells even proposed to the Post Office Department to take over the whole mail service of the United States. The government, however, established its monopoly by law and reduced its charges for letter carriage, to prevent evasion of the law. The four-pound weight limit upon parcels transmissible through the post office assured the express companies of a monopoly of the transmission of a vast class of small parcels, until Jan. 1, 1912, when an act raising the weight limit of mailable matter went into effect. The express companies remain free to carry parcels in competition with the government, but such competition involves the fixing of a much lower level of charges than had prevailed. In consequence of the loss of profits due to postal competition and lowered rate schedules the United States Express Company decided in 1913 to wind up its business. In 1914 the reports of nearly all express companies made to the Interstate Commerce Commission showed expenditures in excess of receipts. See POST OFFICE; RAILWAYS; PUBLIC UTILITIES, REGULATION OF. Consult Stimson, *Express History* (New York, 1858); Johnson, *American Railway Transportation* (New York, 1903); Special Reports of the Bureau of the Census, *Express Business in the United States, 1907* (Washington, 1908); Atwood, "The Great

Express Monopoly," *American Magazine* (New York, February to April, 1912); Interstate Commerce Commission, *Annual Reports of Statistics of Express Companies in the United States* (Washington, 1909-).

EXPRESSION, EXPRESSIVE MOVEMENTS. That bodily movements may serve as indexes of mental states is a matter of daily observation. The smiling face, the bright eye, the animated gestures characteristic of joy and pleasantness, contrast sharply with the attitude of dejection which sorrow and grief entail. Experimental methods have shown that even the simplest modes of affective experience, the pleasure of an agreeable odor, the unpleasantness of a discord, are accompanied by measurable alterations of certain physiological functions. There is variation in strength and rate of pulse and respiration, in the flow of blood into the peripheral blood vessels, and in the tonus of the voluntary and involuntary muscles. But it is naturally in the more complex and far-reaching nervous disturbance of the emotion (q.v.) that bodily expression becomes so well marked as to be accessible to external observation.

One of the peculiar features of emotional expression is the seemingly useless and even positively disadvantageous nature of certain of the bodily disturbances. Why should we curl our lip in scorn? Why should we clap our hands for joy, or blush for shame, or tremble for fear? It is in answer to such questions that various authorities have deduced what are called "the principles of expression," with the aim at once of classifying and of explaining the genesis of the expressive movements. The best-known and most important contributions to this subject are those of Darwin, Wundt, and James.

In 1873 Darwin brought forward three principles, by which he hoped to account for most, if not all, of the expressive gestures involuntarily used by man and the lower animals under the influence of the emotions. Darwin's principles are as follows: 1. *The principle of serviceable associated habits.* Many complicated movements which under certain circumstances were of direct or indirect use are retained when their use is no longer apparent, in consequence of the general laws of association, habit, and inheritance. Thus the cat executes peculiar "pawing" movements with the forefeet when it is pleased. These movements are the relic of the purposeful use of the same movements to start or increase the flow of milk from the mammary glands of the mother. The movements became thereby associated with a pleasurable and satisfied consciousness, and tend to recur whenever such a consciousness recurs. Wundt considers that this principle is but a special case of Darwin's third, the direct action of the nervous system; for the overflow of nervous energy takes those paths which are habitual and most frequently used. 2. *The principle of antithesis.* As Darwin explains it, "every movement which we have voluntarily performed throughout our lives has required the action of certain muscles; and when we have performed a directly opposite movement, an opposite set of muscles has been habitually brought into play. . . . So when actions of one kind have become firmly associated with any sensation or emotion, it appears natural that actions of a directly opposite kind, though of no use, should be unconsciously performed

through habit and association under the influence of a directly opposite sensation or emotion." Thus, impotence is expressed by raised eyebrows, shrugged shoulders, and open palms; since these are the antithesis of the frowning brow, the thrown-back shoulders, and the clenched fists, symbolic of rage and power. James says in comment: "No doubt a certain number of movements can be formulated under this law; but whether it expresses a *causal* principle is more doubtful. It has been by most critics considered the least successful of Darwin's speculations on this subject." 3. *The principle of the direct action of the nervous system*; or of actions due to the constitution of the nervous system, independent from the first of the will and independent to a certain extent of habit. The sudden release of large quantities of nervous energy demands unusual outlet from the central nervous system. This overflow takes place according to the preformed connections of the nervous elements. Its results are visible in the general disturbance of organic function due to the exciting or inhibitory effects of these irradiations of energy from the central nervous system. On this principle are explained such phenomena as the muscular tremors of fear or of great joy; the increased glandular activity of the liver, kidneys, and mammae; the alterations in cardiac and vasomotor functions; and such movements as the clapping of the hands for joy. It is admitted by James, and is practically identical with the first principle of Wundt.

Wundt's principles are likewise three in number: 1. *The principle of direct change of innervation*. This is but a different wording of what we have just discussed as the third principle of Darwin. It involves the principle of the hereditary transmission of certain nervous connections; thus, the reflex of weeping, which probably falls in origin under the third principle, has by inheritance come to take its place under the first. The transmission of a characteristic family physiognomy or general expressive attitude is very common; and we invariably argue from the physical similarity to a similarity of mood, even though there be no possibility of imitation of the parents by the children. These direct changes in innervation are almost always accompanied by a noticeable reactionary effect upon the ideational course of the emotion. The frightened man stutters, not merely because his tongue mechanically refuses service, but also because his thoughts are really brought to a standstill. 2. *The principle of the association of analogous sensations* is based upon the fact that sensations of similar feeling tone easily associate and reinforce one another. This process forms the basis of the most characteristic of all emotive expressions, the "mimetic movements." These are physiologically conditioned by reflex movements in and about the facial sense organs; thus the expression which stands for "bitter" is an arrangement of the parts of the buccal cavity most sensitive to bitter in such a way as to prevent their excessive stimulation by the unpleasant taste. The "sweet" expression, on the contrary, is that calculated to favor the continued stimulation of the tip of the tongue, the part most sensitive to sweet substances. By virtue of the second principle these reactions have come to appear in response not only to an actually bitter taste, but also to an emotional condition which possesses the same general feeling tone. So the expression has become symbolic.

A wry face may denote a mental as well as a physical pain. 3. *The principle of the connection of movement with sense ideas* explains all the facial expressions and gestures which are not included under the two previous principles. Here belong the "pantomimic movements" (such as pointing, and the imitative representation, by movements of arms and hands, of the object which arouses the feeling), the clenching of the fists in anger, and also certain facial expressions, such as the curling of the lip in scorn and the staring eyes of surprise. The principle seems closely allied to Darwin's first. It is not to be thought that any complex expression of emotion must be explained by a single principle. Such phenomena as laughing and weeping demand the use of all three principles for their elucidation.

James proposes the five following principles: 1. *The weakened repetition of movements which formerly were of utility to the subject*. This is equivalent to Darwin's first proposition. 2. *The principle of reacting similarly to analogous-feeling stimuli*. This is identical with Wundt's second principle. 3. *The principle of weakened repetition of movements which under other conditions were physiologically necessary effects*. The respiratory disturbances of anger and fear, e.g., may be considered as "organic reminiscences . . . of the blowings of the man making a series of combative efforts, of the pantings of one in precipitate flight." 4. *The principle of the mechanically determined idiopathic effects of the stimulus*, i.e., the physiological outpourings of excess of nervous energy through the easiest drainage channels (cf. Wundt's first and Darwin's third law). 5. *The principle of the mechanical perpetuation of emotional reactions which may be called accidental as far as their origin goes*. For some of our emotional reactions no plausible reason can be conceived. "In fact, in an organism as complex as the nervous system there must be many such reactions, incidental to others evolved for utility's sake, which would never themselves have been evolved independently, for any utility they might possess." In conclusion it may be said that no one of these explanatory series of principles is logically complete. There is need of further observation, and perhaps of a new construction of principles upon the basis of the psychology of action (q.v.). Consult: Darwin, *The Expression of the Emotions in Man and Animals* (London, 1890); Wundt, *Grundzüge der physiologischen Psychologie* (Leipzig, 1911) and *Völkerpsychologie* (ib., 1900); James, *Principles of Psychology* (New York, 1890); Titchener, *Primer of Psychology* (ib., 1909). See GESTURE.

EXPULSION (Lat. *expulsio*, from *expellere*, to drive out, from *ex*, out + *pellere*, to drive). The act of removing one from the possession of real property, or from an office, or from membership in a body or association, or of depriving him of a right, privilege, or license. Expulsion of the first sort is called eviction (q.v.). The manner in which a public officer may be expelled or removed is generally regulated in this country by constitutional or legislative provision. For example, the Federal Constitution secures to each House of Congress the power to expel a member with the concurrence of two-thirds. In the exercise of this authority it may proceed summarily and need not observe the formalities of judicial procedure. Nor does any appeal lie from its decision. The same Con-

stitution secures to Federal judges both of the supreme and inferior courts tenure of office during good behavior. Recently many statutes have been passed by Congress and by State legislatures limiting or qualifying the power of removing persons from office in certain lines of the civil service (q.v.).

Members of a corporation may be expelled in certain cases, as where they have been convicted of an infamous crime or have been guilty of some corrupt or dishonorable conduct in connection with the affairs of the corporation. A partner cannot be lawfully expelled from his firm unless the partnership contract expressly authorizes expulsion. In such a case, as well as in all other cases of unincorporated associations, the member proceeded against is entitled to notice of charges and an opportunity to defend himself as well as to a fair and impartial decision. See CLUB.

Persons who are not members of a public body or of a private corporation or association may be expelled from its meetings at any time. Even though their attendance has been induced by an authorized invitation, the license or privilege may be withdrawn at any moment; and if they refuse to leave they may be forcibly removed. The same rule holds good in the case of other meetings. Those who convene them have the right to expel objectionable persons, provided they use no more force than is necessary for that purpose. Consult Thompson, *Commentaries on the Law of Private Corporations* (2d ed., 7 vols., Indianapolis, 1908-10), and Pollock, *Treatise on the Law of Torts* (9th ed., London, 1912).

EXTENDED ORDER. The formation in which the units are separated by intervals greater than in *close order*. The purpose of extended order drill is to teach the mechanism of deployment, of the firings, and, in general, of the employment of troops in combat. Such drills are executed at ease. The company is the largest unit which executes extended order drill. Consult *United States Army Infantry Drill Regulations* (Washington, 1911). See INFANTRY; TACTICS, MILITARY.

EXTENSION, IN LOGIC. See DENOTATION.

EXTENSION, EXTENT (Lat. *extensio*, from *extendere*, to stretch out, from *ex*, out + *tendere*, to stretch). The simplest spatial determination of mental processes, as duration (q.v.) is their simplest temporal determination. Not all psychologists are agreed upon the existence of extent as an intrinsic attribute of sensation; but for the present purpose we may provisionally assume that extent, in the sense of "spread-outness," is a characteristic feature, at least, of visual and cutaneous sensations. The validity of this assumption will be discussed later. Of the psychological problems concerned with spatial relations, the majority, such as the perception of form, of distance, position, order, arrangement, the geometrical-optical illusions, etc., take us beyond the treatment of extent as an attribute of sensation. Within the sphere of sensation there are theoretically three problems to be solved: (1) that of the smallest noticeable extent; (2) that of the largest noticeable extent; and (3) that of the just noticeable difference of extents, or the sensible discrimination (q.v.) for extent. These problems must be attacked in the sphere both of visual and of haptic sensations, though the latter are, for practical reasons, limited to a single quality, pressure.

The second question is at once the least important theoretically and the least difficult of solution. Maximal extent of pressure may be obtained, e.g., by immersion of the entire body in water. The "maximum visibile" is obviously measured by the total area of the "field of vision." This embraces for a single eye a region delimited by the following angles (based upon the straight line joining the centre of the pupil with the centre of the "yellow spot"): outward, 70°-85°; inward, 60°-50°; upward, 45°-55°; downward 65°. Hence the maximal field is, for a single eye, an oval measured by a visual angle of 130°-135° horizontally and 110°-120° vertically.

The first problem, that of the smallest noticeable extent, brings us to the well-worn question of the "minimum visibile." Two factors must be constantly regarded: 1. In the neighborhood of the stimulus limen, extent and intensity play into each other's hands. An imperceptibly small area may become perceptible with increased illumination; an imperceptible degree of illumination may become perceptible with an increase in its area. 2. Owing to the error of dispersion (diffusion of stimulation upon the retina), the extent of the object used as a stimulus may not correctly indicate the extent of the stimulated portion of the eye. In the method of Helmholtz the least noticeable visual extent is determined by approximating two luminous points or lines placed at a constant distance from the eye and recording the limit (expressed by the visual angle or the distance between the two retinal images) at which they are just distinguishable. The keenness of vision, thus measured, varies with the part of the retina stimulated; it is greatest at the fovea (where an angular difference of about 1 minute of arc, or a distance between images of 0.004 mm., is just perceptible) and falls to 1/100 of this maximal capacity at 30° to 40° from the fovea. More recent determinations, excluding the error of dispersion, indicate that a lateral displacement in the relative position of two vertical, end-on-end lines is detected when the visual angle is but 7 seconds of arc. Hence, it is argued, the "minimum visibile" is distinctly smaller (0.0005 mm.) than the diameter of a single cone (estimated at from 0.0015 to 0.0041 mm.). But it is doubtful whether these figures, expressing as they do the limen for separation of points, give us any indication of the least visible extent; any more than the least distance for the cutaneous discrimination of two points can be regarded as the least perceptible cutaneous extent. The judgment of two lines or two points does not necessarily carry with it any reference to space. We shall do better, perhaps, to consider the retinal cone as affording the unit of visual extent; although, as is shown later in this article, a limited extent may be less, under certain conditions, than the diameter of a single cone. The limen is further dependent upon the quality of the stimulus. Thus, the space limen for colors must be expressed in terms of three values: (1) the achromatic limen, at which light appears; (2) the chromatic limen, at which color of any sort is seen; and (3) the "characteristic" limen, at which the actual color tone of the stimulus is perceptible; though, in certain cases, two or even all three of these limens may coincide.

We may regard the pressure spot as the unit of cutaneous extent, as the retinal cone is that

of visual extent. The limen of pressure separation, falsely assumed to be identical with the liminal extent, was first investigated by E. H. Weber. Weber's results show clearly the dependence of the limen of separation upon the place stimulated. The following values, taken from his classical table, illustrate this point: tip of tongue, 1 mm.; tip of finger, 2 mm.; cheek, 11 mm.; forehead, 23 mm.; middle of back, 68 mm. By the stimulation of individual pressure spots much lower values have been found: chin, 0.3 mm.; cheek, 0.4 mm.; forehead, 0.7 mm.; back, 5.0 mm. Subsequent work upon æthesiometry, or "Weber's sensory circles," as these experiments are called, has emphasized the law of Vierordt that the space limen at any point in the length of a limb is inversely proportional to the distance of the stimulated part from the axis of rotation, and has called attention to the increase of the limen of separation with fatigue—an increase so characteristic as to be urged by certain investigators as a practical test for degree of general fatigue. See *FATIGUE*.

The third problem, discriminability, is termed in the sphere of vision "eye measurement." The results of many investigations made are often different, since they depend upon many factors difficult of isolation even under experimental conditions. These factors are eye movement, the quality of the compared extents (see under *ILLUSION*), their absolute length, their distance from the eye, their direction (vertical, horizontal, etc.), the use of monocular or binocular vision, etc. Running the eyes along the lines, i.e., the introduction of the strain sensations set up in the eye muscles, appears to aid discrimination of linear extent. When we estimate extent in this way, i.e., partly in terms of intensity, the relative difference limen is approximately constant at 1/50; two lines seem different if one is 1/50 longer or shorter than the other. Recent work has demonstrated that, with the resting eye, one can discriminate at least four different extents, all of which fall within the limits of a single retinal cone, although the actual basis of this discrimination is the quantity of light which falls upon the cone. The discrimination of tactual, like that of visual, extents is complicated by extraneous factors; arm-movement measurements involve the factors of the duration and intensity of strain sensations, while in cutaneous experiments proper it is difficult to exclude judgments couched in visual terms. Two circular surfaces applied to the tip of the tongue may be recognized as different when their diameters are no more than 0.5 mm. and 1 mm.; but on the back they must be 2 mm. and 25 mm. respectively. Cold surfaces appear larger than warm surfaces of equal size.

Our provisional assumption posited extent as an ultimate property of certain sensation systems, as irreducible and unanalyzable as quality or intensity. This view regards the perception of depth and all other spatial relations as derivative products of associations formed by experience. Thus, the quasi-spatial nature of certain sense qualities, e.g., the seeming differences in the "bigness" of sounds, does not demand the assumption of any elementary spatial attribute in these sensations. It remains to be pointed out that this view of extent has not gained universal acceptance. At the one extreme certain psychologists, notably Wundt,

seek to derive all spatial determinations of mental processes from other nonspatial contents of consciousness. (See *FUSION*.) They do not, therefore, postulate a special attribute for any sensation system. At the other extreme certain psychologists, of whom James may be considered typical, ascribe an elementary spatial attribute not only to visual and cutaneous but to all sensations. James prefers the term "voluminousness." "This element, discernible in every sensation, though more developed in some than in others, is the original sensation of space. . . . This 'vastness' is as great in one direction as another. Its dimensions are so vague that in it there is no question as yet of surface as opposed to depth; 'volume' being the best short name for the sensation in question." From the psychological standpoint the merit of these three positions can be adjudicated only upon the verdict of trained introspection as aided by the experimental method. The principle of parsimony must incline us to the simplest consistent theory. From this point of view the merit appears to lie with those who maintain the middle position, though from the genetic side the Wundtian explanation is, perhaps, the most satisfactory. In other words, we may consider that the adult human consciousness is unable by introspection to get behind extent of "spreadoutness" as an ultimate datum of experience, although we may construct a theory of its genesis from other, simpler, nonspatial processes.

EXTERIOR BALLISTICS. See *BALLISTICS*.

EXTERRITORIALITY. The fiction or rule of law by which certain classes of aliens in a country are more or less exempted from its jurisdiction and are governed by the laws of their own country. The right to this exemption is not absolute, but arises from, and is made possible by, the comity of nations; and the reasons for its existence are to be found partly in the survival of ancient laws, partly in reasons of state, and partly in the purpose of protecting the citizens of civilized nations against the unsuitable laws of more barbarous countries.

Entrance into a country, on which the privileges of exterritoriality are based, may be suspended or entirely refused (see *ALIEN*); as, e.g., the entrance of a foreign sovereign or prince may be prohibited for reasons of state, or of foreign armed ships or armies.

The privileges arising from exterritoriality are extended particularly to sovereigns, diplomatic agents, especially ambassadors and their suites, family, and servants, and to public armed vessels and armies in permitted transit. The person of a sovereign traveling in a foreign country is inviolate, and he is exempt from the law of the land; but he has no greater powers than he would have at home and has no authority over any except his own subjects who form part of his suite, retinue, or servants. This privilege does not at any time extend, either in the case of sovereigns or any other, so as to exempt from the local laws any property, real or personal, belonging to such person except the effects brought with him. Public armed vessels are to be distinguished from vessels of private citizens. Although the latter, so long

as they are upon the high seas, remain fully subject to the jurisdiction of their own country, whenever they enter within the waters of a foreign country they become, with all on board, subject to the laws of the country within whose waters they are as fully as if ashore. A public armed vessel, however, and vessels chartered to convey a sovereign or his representatives, continue subject, with their crews, to the law of their own country. When ashore, the crew become subject to the local administrative law, and, if guilty of aggression or hostility, can be arrested forcibly if necessary, and punished according to the law affecting the aggression committed. Such transgressions expose the guilty persons not only to arrest and trial, but to complaint to their own sovereigns. The public vessel, however, may not exceed the privileges extended to it on account of its character, nor exercise other rights which it would have on the high seas, such as committing an act of war, or the capture of foreign vessels while within the waters of a foreign state. The permission to an army to go through a foreign country carries with it the right to maintain its discipline and do all other things connected with the passage of the troops which may be necessary to maintain the integrity of the army during its passage. This may extend to the purchase of provisions, but will not excuse crimes or breaches of the public law of the land. The permission is rarely extended; and when it is, it is usually by treaty. The privileges extended to an ambassador or other diplomatic agent arise partly from the consideration that they are essential to the proper conduct of the business intrusted to him and partly from considerations of respect to the foreign sovereignty represented. They begin when he enters the country and continue till his departure, or until a reasonable opportunity for it has elapsed. See **DIPLOMATIC AGENTS**.

Analogous to these privileges arising out of the comity of nations are those which are secured by treaty for foreigners from Christian lands in certain Oriental countries, where the prevailing laws and usages are unlike those of Christendom, or are so barbarous that there is reason to fear that justice will not be done, or that it will be administered in such a manner as not to protect life, limb, and property according to the standards of civilization existing in Christendom. By treaties between the United States and China, Korea, Borneo, Madagascar, Persia, Turkey, Samoa, Siam, Zanzibar, and Tonga, the citizens of the United States are more or less fully exempted from local jurisdiction and are allowed to remain under the jurisdiction of the United States. Formerly the United States had such a treaty with Japan; but when that nation attained the dignity of a great power, the treaty was abrogated. See **CONSUL**. Consult: Woolsey, *Introduction to the Study of International Law* (7th ed., New York, 1902); Phillimore, *Commentaries on International Law* (London, 1889); the authorities referred to under **CONSUL**, **MERCANTILE**, **DIPLOMATIC AGENTS**, **INTERNATIONAL LAW**; ETC.

EXTINCT ANIMALS. Extinct animals, as the term is used in the present article, means those whose species have been exterminated since the advent of man upon the earth, and in most cases, as a matter of fact, by his agency, directly or indirectly. It is not to be presumed that a

complete list of species so exterminated could be given, since many, no doubt, completely disappeared before any sort of record began. Others, as we know or suspect, survived into the era of prehistoric man, but not later. Many species, however, have disappeared, not only since written records began, but within the past century or even within the memory of men now living; and it is these which will demand most attention.

Exterminating Influences. The causes of the disappearance noted arise from man's varied utilization of nature for his benefit or pleasure. Directly, he destroys animals (1) for the sake of their flesh as food, or of their skins as clothing, bedding, or shelter, and for various utilizations of other parts and products; (2) because they may be dangerous to his life or troublesome to his enterprises or comfort; (3) in sport; (4) by domestication. Indirectly animals suffer, sometimes to the extinction of their species, by man's clearing of the forests, draining of marshes, burning over areas by prairie and forest fires, damming or divergence of rivers, fencing in and cultivation of the ground, thus destroying pasturage and other food, limiting movement, and in many ways interfering with animal methods and means of obtaining a livelihood. Another potent influence is man's turning loose upon wild life new enemies in the shape of his domestic dogs, cats, rats, goats, or hogs, or of introduced exotic animals, all of which, intentionally or otherwise, are injurious to some or many wild creatures, and in some instances have been the principal agent in the extermination of lost forms. Many minor circumstances have contributed to the depletion or disappearance of animals in all the more civilized parts of the earth; and it must be remembered that the extinction of any species has a distinct effect upon some or many others. Thus, the removal of the herbivorous quadrupeds from a region would result in death by starvation of all the larger carnivores of that region.

Extermination of Animals by Prehistoric Men. Just how far we are to attribute to the direct agency of primitive man the extinction of forms that evidently survived until after his advent upon the earth must be a matter largely of opinion. There seems good reason to suppose that the last of various species of moalike birds were destroyed by the primitive inhabitants of New Zealand and Madagascar; but there is a fair possibility that the cold of the Glacial period is wholly responsible for the end of a group that no doubt was waning. The same remarks apply to the mammoth and mastodon. That man was contemporary with the last of the mammoths in southern Europe seems indubitable; that the American mastodon was ever seen alive by human eyes is, on the other hand, very doubtful. At any rate, the termination of their career over the vast areas of the northern half of our hemisphere cannot be attributed to human hands. Paleolithic man probably hunted not only the mammoth, but several other animals whose early extinction may have been hastened in southern Europe, such as the huge sabre-toothed tigers (*Macharodus*), the ancient grizzly and brown bear, the larger varieties of the lion and spotted and striped hyenas, the woolly rhinoceros (*Rhinoceros tichorinus*) and related species, and various smaller animals long extinct. Some of these were northern, like the musk ox, reindeer, Arctic fox, etc.; others southern, like the African elephant and hippopotamus. In the changes of

climate which accompanied and followed the Glacial period these and other species disappeared from southern Europe, to survive, if at all, only in the north or in Africa, as their adaptations required. Certain species we know or may feel sure survived until destroyed by mankind. Such was the case with the great-horned Irish deer (see DEER: ELK), which assuredly survived until the close of the Bronze age. The two most interesting instances of prehistoric extermination, however, are those of the horse and the camel. The wild stock of neither of these has been certainly known within historic times. How long it may have survived in Asia or northern Africa we have no present means of knowing; still less of answering the question whether any indigenous horse was contemporary with early man in South America. Much evidence exists, however, of the presence of native horses in Europe well on into the Neolithic period of human settlement there. They were hunted and killed mainly for food, no doubt, but seem to some extent to have been domesticated. Just how long they lasted is uncertain, but it seems indubitable that man is responsible for their ultimate extinction. Whether, at some earlier period, a separate species of dog, the founder of the races of domestic dogs, ever existed, or if so was exterminated after partial domestication by man, is purely conjectural. (See DOG.) The saiga was killed off in southwestern Europe prehistorically, but has survived eastward.

Extirpation in the Old World within Historic Times. Since written records began, several species have vanished from the fauna of Europe, but remain elsewhere, or are preserved in carefully guarded remnants. The lion, tiger, leopard, and various wild cats once inhabited the valley of the Danube, and the lion was common there in Roman times. When the Romans first penetrated central and western Europe, they found numerous not only the "bonasus," which we now mistakenly call the aurochs, but a race of great wild cattle. Mere remnants of these (see BISON; CATTLE) remain in a more or less impure condition on private preserves. The native roe and fallow deer (q.v.) would long ago have perished had they not been protected and bred in parks and hunting forests. The chamois of the Alps survives only under legal protection, which has not sufficed to keep the ibex, now utterly extinct. The same might be said of certain lesser animals. Brown bears existed in Scotland up to the time of Edward the Confessor, but not later, and the last reindeer disappeared from Caithness about the same time. The beaver probably remained in Scotland and Wales until the thirteenth century. Wild boars were hunted until the end of the seventeenth century, and the wolf eluded his doom much longer, the last one being killed in England during the reign of Henry VIII, in Scotland in 1740, and in Ireland in 1775.

Asia furnishes few or no examples of animal extinction of importance since written records began, with the exception of the rhytina and a cormorant, both of which once dwelt on islands off the coast of Kamchatka. The rhytina was a sea cow, closely related to the manatee (q.v.), but much larger, which was confined to the Commander Islands in Bering Sea, where it was discovered by the expedition of Bering, which was wrecked there in 1741. During the next 20 years these islands were constantly visited by seal and fur hunters, who slaughtered the ani-

mals to obtain their beeflike flesh. It has been estimated by Stejneger (*American Naturalist*, vol. xxii, Philadelphia, 1887), who made local investigations, that not more than 3000 rhytinas herded there altogether, and the last one was killed about 1768. In the same island group, and nowhere else, there dwelt a very large but small-winged cormorant (q.v.), called Pallas's, after the Russian naturalist, its first describer. It was stupid and slow in its movements, furnished excellent flesh, and although a few survived the occasional visits of hungry sea hunters until 1830, at least, the end then came.

Liability of Insular Faunas to Destruction. The examples just recounted illustrate many cases in which inhabitants of small islands have succumbed to changes in their limited circumstances. Thus, the New Zealand group has lost several birds which were either confined to isolated and limited places or were helpless to escape from European colonists. A certain quail (*Coturnix*) and the owl parrot (*Nestor*) are gone; and of two species of kaka parrots (*Nestor productus* and *norfolkensis*) none remains upon either Philip or Norfolk Island, where they abounded respectively previous to 1850. Several other Australasian species which spend their lives upon the ground are weak of flight and, unaccustomed to such enemies, are rapidly disappearing under persecution by rats and by imported ferrets, weasels, etc., introduced by the English settlers in an unwise attempt to subdue the plague of rabbits, which they had previously "acclimatized." One of the forms most threatened are the curious flightless weka (q.v.) rails, of which closely allied species once existed on Norfolk Island, on Lord Howe Island, and on one of the Chatham Islands. Dixon quotes Dr. Forbes in the statement that 17 species of birds that formerly lived on Chatham Islands have become extinct. The civilization of the Sandwich Islands has led to the destruction of several birds, one of which, the mamo (q.v.), was sought for the sake of its rich yellow feathers, used as an ornament of the cloaks of the chiefs, until none remained; another, related to the wattle crows, succumbed to the clearing of certain brushy woods by cattle and goats. Tahiti seems to have lost utterly a certain rail (*Prosobonia leucoptera*) and Latham's white-winged sandpiper (*Hypotaenidia pacifica*); and another shore bird (*Elanoides forsteri*) has died out in the Christmas Island group.

The most conspicuous examples of island birds extinguished since white men discovered their isolated homes are afforded, however, by Mauritius and the neighboring islands of the Indian Ocean. Mauritius, when rediscovered by the Dutch at the end of the sixteenth century, was inhabited by that singular and inept bird the dodo (q.v.), relations of which (see SOLITAIRE) have perished likewise in the islands of Réunion and Rodriguez. In Mauritius, besides the dodo, at least two species of parrot, a dove, a large coot, and a second railine bird, abnormally flightless and long-billed, called *Aphamapteryx*, have become extinct. Réunion, also, once had other birds now lost, and so had Rodriguez. In Réunion, a somewhat abnormal starling, *Fregilupus*, existed until about 1850, while from Rodriguez the greater part of its original avifauna has vanished. There were a small but peculiar owl (*Athene murivora*), a big parrot (*Necropsittacus rodericanus*), a dove (*Drythraena*, sp. ign.), a large brevipennate heron

(*Ardea megacephala*), and a singular rail, besides other birds of which we know from the old voyagers.

The destruction of bird life in these islands was due not only to direct chase by man, but indirectly to the introduction of domestic or other animals. The hogs let loose in the Mascarene Islands finished the dodos and their relatives, and rats have done great mischief in Oceanica. Fires, too, have burned the coverts, destroyed nests and eggs, and killed much or all of the food of many species by consuming reptiles, insects, mollusks, worms, etc., great numbers of species of which are also to be counted among the animals recently extinct. This agency was especially potent in the Antilles.

The turtle tribe presents a parallel case of extinction in the island-inhabiting species of gigantic tortoise (q.v.)—isolated survivors of forms widespread during the later Tertiary age. During the historic period various species of these gigantic tortoises have been numerous on the Mascarene Islands, on Aldabara, a small island northwest of Madagascar, and on the Galápagos Islands, west of South America. At the end of the seventeenth century they existed by thousands in Mauritius (three species), Rodriguez (one species), and Réunion (one species). In Mauritius they were still abundant until about 1750, when they became so scarce that importations from Rodriguez were made by the shipload, as food for the garrison; and the continuance of these supplies (also sent to the Seychelles), together with the constant destruction of the eggs, exhausted the stock of tortoises about the end of the eighteenth century. Those of Réunion had vanished long before; and a single aged captive at Saint-Louis, Mauritius, still alive in 1895, at an age probably approaching 200 years, is the sole survivor of the great herds of Rodriguez. Aldabara had originally four species, only one of which, the elephant tortoise, survives and is very scarce. The Galápagos possessed several species, all good for food, and now destroyed with the exception of a few on Albemarle Island and about 100 specimens living in various zoölogical gardens. See TORTOISE.

Africa has been the scene of extraordinarily rapid changes in faunal characteristics during the last century, and its later decades have witnessed the extermination as wild game, if not absolutely, of many of the largest and finest quadrupeds in its list. The herds of elephants, buffaloes, antelopes, and other grazers which thronged upon the plains and in the forests of South and Central Africa when Europeans began to colonize there, were past counting.

This wealth of game was ruthlessly destroyed by Arab and Portuguese traders and Dutch farmers, and then by English and German sportsmen, settlers, and hide hunters—the last the worst agents of destruction, as has been the case in America. The result has been the depletion of game throughout all the more open regions, until now many species, exceedingly numerous previous to 1850, have become rare, and obtainable only in remote districts, while several species of the finest of African quadrupeds have totally vanished. One of these is the square-mouthed rhinoceros (*Rhinoceros simus*), none of which has been seen for several years. Another lost species, and one greatly to be regretted, is the true quagga (*Equus quagga*), a magnificent wild horse which originally roamed

over South Africa, but was killed off by the Boers, first as food for their black servants, and later for the hides, until it utterly disappeared by 1875 or 1880. An even earlier date had witnessed the extermination of the true or mountain zebra (q.v.), which lingered somewhat longer in the Abyssinian interior, but seems now entirely gone. Several of the larger antelopes have met or seem about to share the fate of these lost horses. The eland has been nearly extirpated by Dutch hide hunters. The blaubok (*Hippotragus leucophaeus*) has long been extinct, and its relatives the magnificent sable and roan antelopes (qq.v.) are growing rare; the white-tailedgnu (q.v.) is on the verge of extinction, except for a few preserved as captives; the bontebok and blesbok (qq.v.) are rapidly approaching the same fate; and the giraffe, on account of its incessant persecution by men in search of its valuable hide, remains numerous only in the remote waterless regions of the northern Kalahari Desert. A monkey (*Colobus kirki*) of limited distribution on the West Coast and the island of Zanzibar is now supposed to be extinct. See HARTBEEST.

Extirmination in America. The list of the larger animals lost to America since its rediscovery and settlement by Europeans is a long one. Whether or not a native horse lingered in small numbers in South America is a matter of dispute. If there was such an animal, it so quickly disappeared and was replaced by herds of escaped Spanish horses as to have left no trace of itself. The story of the extermination of the bison, of which the only remaining wild remnant at the opening of the twentieth century was a herd of about 250 in the forests north of the North Saskatchewan, is familiar to most readers. (See BISON.) Several marine mammals of our shore have suffered or are doomed to speedy extinction. The case of the rhytina of Bering Sea has been noticed. Its relative, the manatee, is all but extinct in Florida and rare elsewhere. The fur seal of the North Pacific (see SEAL) seems likely to die out within a few years, as also does the walrus, now wholly Arctic, except in the neighborhood of Bering Strait. There formerly existed in great numbers along the Californian coast a local sea elephant (see ELEPHANT SEAL) which until about 1850 furnished profitable sealing. A herd of about 150 individuals on the small island of Guadaloupe, off Lower California, represents all that is left of this species. The few elephant seals still remaining about Cape Horn and small isolated South Pacific islands, represent an expiring race. The West Indian monk seal (*Monachus tropicalis*), once common around the Gulf of Mexico and the Caribbean Sea, had been mainly killed off by 1850, and since then has lingered only on a small group of islets, the Triangles, north of Yucatan, where an accident may easily put an end to the small band.

In respect to birds the New World has suffered much loss by the changes incident to civilization. The best-known case, perhaps, is that of the great auk (see GAREFOWL), which was literally hunted off the face of the earth. It should be said, however, as in several other cases, that this species had a very limited distribution and was waning. Its migrations once extended southward along the west coast of Great Britain to the Bay of Biscay in Europe, and in America southward to Cape Hatteras. Evidence of this is derived from finding its bones in pre-

historic shell heaps along the coast. It seems to have occasionally visited Norway, but it never was an Arctic bird. Its extermination was no doubt largely effected prehistorically, for within the time of records it has rarely been known to visit even the Hebrides, and its breeding places were few. It had bred abundantly from time immemorial on the Garefowl Skerries, off the southwest coast of Iceland, and might have remained there yet, had not a volcanic disturbance in 1830 destroyed the islets. The survivors fled to Eldey Island; but as this was more accessible, the colony was raided repeatedly by fishermen, and in 1844 the last pair of auks was killed. This ended the history of the garefowl in Europe. How long certain Greenland colonies lasted is not known. In 1534 the men sailing with Jacques Cartier to the discovery of the St. Lawrence River found on Funk Island, off Cape Bonavista, on the northeastern coast of Newfoundland, a resort of these and other sea birds, where the "penguins" (for this term was first applied to this species and later transferred to the Spheniscidae) were breeding in thousands. The indiscriminate slaughter of these birds came to an end at an uncertain time, probably about 1840. According to a list published in England in 1888, 79 skins were known to exist, with 10 skeletons and 68 eggs. A third of these are preserved in public museums in various parts of the world, and the remainder are privately owned. When by chance these remains are sold, very high and rapidly increasing prices are paid. At a notable auction sale of an ornithological collection in London in 1893, one skin in excellent condition was sold for 360 guineas (about \$1800), and an egg brought 180 guineas (about \$900). A very complete account of the history of the great auk, together with a full bibliography, may be found in F. A. Lucas's account of his expedition to Funk Island, in 1887, to recover relics of the bird, published in the *Annual Report of the Smithsonian Institution* for 1888.

The next most conspicuous instance of the loss of an American species of bird is the case of the wild or "passenger" pigeon, which within the last half of the nineteenth century disappeared (but not completely), in a manner not easily accounted for, from a great region in the central United States where previously it had been surpassingly numerous. Its history will be found in the article PIGEON. The Eastern pinnated grouse (see article GROUSE) survives only in few examples on Martha's Vineyard, which, in spite of legal protection, seem destined to early extinction by semiwild house cats. The Carolina parakeet (q.v.) is a small parrot once very common throughout the lower Mississippi valley, now to be found (if at all) only in a few remote swamps of the Gulf coast; and the large Cuban macaw (*Ara tricolor*) is wholly extinct. Another bird of that region, the ivory-billed woodpecker (q.v.), is probably wholly gone. It is believed that the Antilles and lesser of the West Indian islands have been deprived of many species of birds and other animals since they were first colonized, because recent collectors have been unable to find several species described by early writers, and others have become extremely rare. Newton mentions the loss of a species of petrel (*Asstelata hawitata*) of Dominica killed off by a carnivorous marsupial unintentionally introduced into that island; and the mongoose (q.v.) is extirpating

a related petrel in Jamaica. Finally, the California condor (q.v.) has been added most lately to the list of vanishing American birds, only a few pairs remaining, in the mountains of Southern California.

For the decrease or disappearance of certain fishes, see FISHERIES; FISH CULTURE.

Bibliography. Boyd Dawkins, *Cave Hunting* (London, 1874); Harting, *British Animals Extinct within Historic Times* (ib., 1880); Wallace, *Island Life* (London and New York, 1880); Grieve, *The Great Auk* (London, 1885); Buller, *Birds of New Zealand* (2d ed., ib., 1888); Newton, *Dictionary of Birds* (London and New York, 1893-96); Bryden, *Nature and Sport in South Africa* (London, 1897); Dixon, *Lost and Vanishing Birds* (ib., 1898); *Annual Report of Smithsonian Institution for 1888* (Washington, 1889); Lankester, *Extinct Animals* (New York, 1905); Rothschild, *Extinct Birds* (London, 1907); Hutchinson, *Extinct Monsters and Creatures of Other Days* (new ed., New York, 1911); Loomis, *Hunting Extinct Animals in the Patagonian Pampas* (ib., 1913); Finn, *Wild Animals of Yesterday and To-day* (London, 1913). Consult also the bibliography under DOMESTIC ANIMALS, and the various titles referred to in that article.

EXTINCT BIRDS. Various birds may be called "extinct" instead of "fossil," because their species have expired since the present geological era began, or, in several cases, since written records began to be made. In most cases these were birds that belonged to ancient and senescent races, such as the ratite moas (q.v.) and their kindred; or they were species of extremely limited range, or of degenerate powers, due to an insular habitat or other unfavorable surroundings. Consult Rothschild, *Extinct Birds* (London, 1907). See EXTINCT ANIMALS.

EXTINCTION OF SPECIES. The extinction of species and higher groups has been due to two causes—first, changes in the physical geography and other environmental conditions of the globe during past geological time, and, second, to changes in the biological environment.

Geological Extinction. The primary factor, therefore, in the extinction as well as the origin of life forms is geological changes. If we glance back through the geological ages, we shall see that there were instances of the comparatively rapid extinction of types or whole groups (orders and classes) of animals. The more remarkable were the death and disappearance of the trilobites and ammonites. Darwin remarks: "The extermination of whole groups, as of ammonites towards the close of the Secondary period, has been wonderfully sudden." The trilobites as well as the important order of Eurypterida ceased to exist at the end of the Paleozoic era; the Silurian graptolites, that very considerable group of hydroids, disappeared with comparative suddenness. Coming down to the Mesozoic age, there was a remarkable extinction of types. The greater number of crinoids and brachiopods, and all the dinosaurs and ornithosaurs, as well as the pythonomorphs, these groups comprising the most highly organized reptiles which have ever lived, wholly perished towards or at the close of the Cretaceous period.

It should be borne in mind that these facts of comparatively rapid extinction have nothing in common with the Cuvierian catastrophic doctrine of sudden wholesale extinctions and recreations. But known facts of geology postulate long peri-

ods of quiet preparation, succeeded by more or less sudden crises, or radical changes in the physical structure of continents, resulting in catastrophes, both local and general, to certain faunas or groups of animals as well as individual species. These so-called catastrophes, though geologically sudden, may have required thousands of years for accomplishment.

There have been in the course of the earth's history a number of crises or revolutions which were attended with the loss and extinction of types.

There were enormous changes in the relative distribution of land and sea in pre-Cambrian times. The strata of the Lower and Upper Huronian are unconformable to each other, the Keewenawan beds are unconformable to the Huronian. Between each two series is an unconformity representing an interval of time long enough for the land to have been raised above the seas, for the rocks to have been folded and to have lost by erosion thousands of feet, and for the land to have sunk below the surface of the ocean. Again, between the pre-Cambrian and Cambrian eras there was a great uplifting and folding of rock, succeeded by long-sustained erosion, over all the continental era.

At the end of the Paleozoic era occurred the Appalachian revolution. This was a period of mountain building and of continent making, and on the whole was the most extensive and biologically notable event in geological history. In its effects on life, whether indirect or direct, it was of vastly greater significance than any period since, for contemporaneous with, and as a probable consequence of, this revolution was the incoming of the vertebrates with limbs and lungs, adapted to a terrestrial life. The Appalachians of the Paleozoic times were perhaps as high as the Sierra Nevada or Andean Cordillera of the present time. During this period the cryptogamous forests and their animal life may have been confined to the coastal plains and lowlands, while on the higher, cooler levels may have existed a different assemblage of life; and it is not beyond the reach of possibility that a scanty subalpine flora and fauna peopled the still cooler summits. But this process of mountain building and erosion was not confined to the end of the Paleozoic era. Since that period there have been along the Atlantic border of the growing and changing continent several successive cycles of denudation extending down to the present time. The great Appalachian plateau with its lofty mountain ranges and peaks rising from the shores of the Atlantic probably presented during the Mesozoic era different climatic zones, from tropical lowlands with their vast swamps, to temperate uplands, stretching perhaps up to Alpine summits. New Zealand at the present day has a subtropical belt of tree ferns, while the mountains bear glaciers on their summits. The Jurassic was a time of great denudation, when the high ranges of the Appalachian plateau were worn down, and the newly upheaved, tilted, and vaulted beds of the Trias were deeply eroded. During the Cretaceous period this region was a peneplain, the scenic features roughly recalling those of North Carolina and New England at the present day. Then there was a relevation, and in the Eocene Tertiary period the swelling and upheaval of the Appalachian dome began again.

We can in imagination see, as the result of these changes in a comparatively restricted por-

tion of the earth's surface, resulting in the formation of separate basins or areas inclosed by mountain ranges, with different climates and zones on land, what a profound influence must have been exerted in the origination and also the extinction of species. In other parts of the world there were corresponding changes. The later revolutions, as those of Tertiary times, were perhaps less marked and extensive. Yet towards the close of this period the great mountain ranges of Asia and Europe, the Alps, Pyrenees, Caucasus, Himalayas, as well as the Atlas of North Africa and the Cordilleras of North and South America were upheaved. The western Alps rose to a height of 11,000 feet, and the Himalayas to a horizon 16,000 feet above the sea, while there were corresponding elevations in western North America and in the Rocky Mountain region.

The last great revolution, which, profound and widespread as it was in the Northern Hemisphere, did not apparently affect life and nature in the tropical zone, was the Glacial period. During this time there was, besides extensive migrations southward, and consequent modifications of species which could not resist the cold, a widespread extinction, not only of numberless individuals, but of floras and faunas, a few forms becoming adapted to a circumpolar climate.

Biological Extinction Due to Competition. During all these changes, as the result of the struggle for existence, the competition between the outgoing and the incoming types and floras and faunas, there resulted vast biological changes, i.e., extinctions and recreations.

In summing up the grand results of the Appalachian revolution and of the times immediately succeeding, Packard states that we should not lose sight of the fact that the changes in the earth's population were due to biological as well as geological and topographical factors. The process of extinction was favored and hastened by the incoming of more specialized forms, many of them being carnivorous and destructive. For example, nearly all fishes and reptiles live on other animals. The struggle for existence between those which became unadapted and useless in the new order of things went on more actively than at present. The process of extinction of the higher, more composite amphibians (the labyrinthodonts) was largely completed by the multitude of theromorphs and dinosaurs which overcame the colossal *Cheirotherium*, *Mastodonsaurus*, and their allies. Woodworth also states that "the exact cause of their decline is probably to be sought in the development of the more powerful reptiles." The demise of the ornithosaurs or pterodactyls was assisted, says Packard, in two ways: those with a feebler flight succumbed to the agile, tree-climbing dinosaurs; while the avian type, waxing stronger in numbers and powers of flight and exceeding in intelligence, exhausted the food supply of volant insects, and drove their clumsier reptilian cousins to the wall, fairly starving them out; just as at the present day the birds give the bats scarcely a *raison d'être*.

At the close of the Jura-Trias period there was a widespread extinction of the peculiar coniferous plants of the Mesozoic, and they were succeeded by forests of deciduous trees of modern types. Vast forests of deciduous trees, such as the oak, sassafras, poplar, willow, maple, elm, beech, chestnut, and many others, as well

as of conifers and palms, clothed the uplands, while in the jungles, on the plains, and in the openings of the forests, gay flowers bloomed. The flora must even then have been, comparatively speaking, one of long existence, because highly differentiated composite plants, like the sunflower, occur in the Upper Cretaceous or Raritan clays of the New Jersey coast.

While the changes of level did not affect the abysses of the sea, the topography of the shallows and coast was materially modified, and to this was perhaps largely due the extinction of the ammonites and their allies.

In 1862 Wood more fully discussed this matter and mentioned the same cause as suggested by Packard. "This disappearance," says Wood, "of the Ammonitidæ, and preservation of the Nautilidæ, we may infer was due to the entire change which took place in the condition of the shores at the close of the Cretaceous period; and this change was so complete that such of the shore followers as were unable to adapt themselves to it succumbed, while the others that adapted themselves to the change altered their specific characters altogether. The Nautilidæ having come into existence long prior to the introduction of the Ammonitidæ, and having also survived the destruction of the latter family, must have possessed in a remarkable degree a power of adapting themselves to altered conditions." On the other hand, the dibranchiate cephalopods (cuttles or squids), living in deeper water, being "ocean rangers," were quite independent of such geographical changes. Wood then goes on to say that the disappearance of the tetrabranchiate group affords a clew to that of the Mesozoic saurians, and also of cestraciont sharks, whose food probably consisted mainly of the tetrabranchiate cephalopods. "Now the disappearance of the Tetrabranchiata, of the cestracionts, and of the marine saurians, was contemporaneous; and we can hardly refuse to admit that such a triple destruction must have arisen either from some common cause or from these forms being successively dependent for existence upon each other."

Woodworth suggests that mammalian life in the Mesozoic age was unfavorably affected by the nature of the peneplain of the Atlantic coast and by reptilian life.

"The weak marsupials or low mammals, which first appear in this country with Dromatherium in the tolerably high relief of the Trias, were apparently driven to the uplands by the more puissant and numerous reptilia of the peneplain. Their development seems also to have been retarded." Again he says: "To sum up the faunal history of the Mesozoic alone, we have seen that *pari passu* with the creation of broad lowlands there was brought on to the stage a remarkable production of reptiles, a characteristic lowland life; and we note that the humble mammalia were excluded from the peneplain or held back in their development, so far as we know them by actual remains, during this condition of affairs until the very highest Cretaceous. At the close of the Mesozoic, the area of the peneplain was uplifted and there came into it the new life. Not only the changed geographic conditions, but the better fitted mammalia also were probably factors in terminating the life of the peneplains."

After the placental mammals once became established, as the result of favorable geographical conditions of migration, isolation, and second-

arily of competition, the evolution as well as the elimination of forms, as is well known, went on most rapidly. Remains of over 2000 species of extinct mammals during Tertiary times which existed in America north of Mexico have been already described, where at present there are scarcely more than 300. This is an example of the amount of extinction which went on in a single class of animals. There must have been corresponding rates of extinction in the case of birds, fishes, and insects.

The rapid summary we have given of the successive changes and revolutions in the earth's history, and the fact that they are accompanied or followed by the process of the extinction of the unadapted, and their replacement by the more specialized and better adapted, show that there is between these two sets of phenomena a relation of cause and effect. The subject is further illustrated by the extinction of life in South America.

The Andean plateau during the Quaternary period was paroxysmally elevated into the air some 12,000 feet. Packard calls attention to the possible results of such an enormous upheaval on the plants and animals of this region. Before and at the time this movement began, when the land was 12,000 feet lower than now, the Atlantic trade winds, which now cross Brazil, impinge upon the Andes, and drop their moisture on the eastern slopes alone, favored as well the western slopes and Pacific coast. The tropical flora and fauna now confined to the neighborhood of Guayaquil on the coast of Peru then probably spread over Bolivia, Ecuador, Peru, and Chile to Patagonia. At Riobamba, altitude 9200 feet, the climate and vegetation are temperate; here occur bones of the mastodon, horse, deer, and llama—animals which may have lived in a temperate climate. But was not their extinction and that of the colossal sloths, armadillos, and other animals of the pampas, largely due to a change of climate resulting from the elevation of the Andean plateau? As the land gradually rose, the atmosphere would become more rarefied and insupportable to tropical life; the animals and plants would either seek lower levels or undergo extinction, or in certain cases become modified into species suited to a temperate climate. As the plateau rose still higher, the air would become too cold and rarefied for even the mastodon and horse. Gradually an alpine zone became established, and finally the higher peaks of the Andes, at an elevation of 15,000 feet, became mantled with perennial snow, and on Chimborazo glaciers established themselves. We thus see how, within Quaternary times, temperate and alpine zones became established over the vast Andean plateau, originally, perhaps at the end of the Pliocene, a plateau of the third order, clothed with vast forests like those of Brazil and Venezuela.

Another, but more local, cause of extinction is seen in Great Salt Lake, Utah. Formerly this was a vast fresh-water lake, abounding in fish, insects, mollusks, and plants. When it was by elevation of the lake basin transformed into a brine pool, all life was extinguished, except a shrimp, a single species of fly, and an alga. So with deserts; when they are formed, life is reduced to a relatively small proportion.

That there is a limit to the age of species as well as to individuals almost goes without saying. As there is in each individual a youth, manhood, and old age, so species and orders rise,

culminate, and decline, and nations have risen, reached a maximum of development, and then decayed. The causes, however complex, are, in the case of plants and animals, apparently physical; they are general and pervasive in their effects, and have been in operation since life began; there have been critical periods in paleontological as well as geological history, and periods of rapid and widespread extinction as well as a continual, progressive dying-out of isolated species. Such extinction was, so to speak, a biological necessity, for otherwise there would have been no progress, no evolution of higher types.

EXTORTION (ML. *extortio*, Lat. *extorsio*, from *extorquere*, to extort, from *ex*, out + *torquerre*, to twist). In its widest sense, any form of taking or obtaining anything from another by means of illegal compulsion or oppressive exaction. As a technical term of the common law, it has been judicially defined as the "crime committed by an officer of the law, who under color of his office unlawfully and corruptly takes any money or thing of value that is not due to him, or more than is due, or before it is due." It is by the common law a misdemeanor punishable by fine and imprisonment, and subjecting the offender to removal from office. In most of the United States the term has received statutory definition. For example, in New York it is defined as "the obtaining of property from another, with his consent, induced by a wrongful use of force or fear, or under cover of official right." (New York Penal Code, § 552.) Consult *Encyclopædia of Pleading and Practice*, vol. viii (23 vols., Northport, N. Y., 1894-1900).

EXTRACT (ML. *extractus*, extract, from Lat. *extractus*, p.p. of *extrahere*, to draw out, from *ex*, out + *trahere*, to draw). In a medical or pharmaceutical sense, any vegetable preparation obtained by treating a plant with a solvent and evaporating the solution to about the consistency of honey; or by expressing the juice of the plant and evaporating—forming respectively liquid and solid extracts. Extracts contain only those vegetable principles that are either held in solution in the juices of the plants themselves, or are soluble in the liquid employed in extracting them, and at the same time are not so volatile as to be lost during evaporation. Since many extractive matters are more or less volatile, it makes a great difference whether the operation is conducted at a low or at a high

temperature. Extracts are called watery or aqueous, alcoholic, or ethereal, according to the menstruum employed. Extracts are liable to great uncertainty in point of strength and composition, and require to be prepared with great care. Evaporation *in vacuo* is found to be a great improvement, as it may be effected at relatively low temperatures.

EXTRACT OF MEAT. An extract obtained by treating chopped meat (beef) with cold water, then very gradually raising the temperature, when about one-eighth of the weight of the meat is dissolved, leaving an almost tasteless insoluble fibrine. (See BEEF TEA; BROTH.) Heating coagulates the nutritious albumen, which forms a scum and is removed along with any fat. The liquid may be concentrated into small bulk, either in an open pan or in partial vacuum, yielding a more or less thick paste or thick liquid which consists of the so-called meat extractives, including substances which give flavor to meat. *Bouillon Cubes*, *Soup Tablets*, etc., are made from meat extract concentrated until very thick and sometimes specially flavored. Extract of beef is used to make beef tea, bouillon soups, to flavor gravies, and in many similar ways in cookery. It has almost no nutritive value, although it stimulates a normal flow of gastric juice and so may aid the digestion of other foods. It is for such stimulating properties that it is used in the sick room. Consult *United States Department of Agriculture, Bureau of Chemistry, Bulletin 114, "Meat Extract and Similar Preparations."* See MEAT EXTRACT; FOOD, PRESERVATION OF.

EXTRA CURRENT. See ELECTRICITY.

EXTRADITION (from Lat. *ex*, out + *traditio*, delivery, from *tradere*, to give over). The surrender by one state or nation to another of a fugitive from justice. Strictly speaking, extradition is a modern practice, although Hannibal's delivery was stipulated for in a Roman treaty, and more than once Roman citizens were surrendered to a foreign power. These acts, like many others in ancient, mediæval, and early modern times, were confined to those who were considered enemies of the state. The right to deny the privilege of asylum was a prerogative of the sovereign, and sovereigns frequently used it so as best to secure their personal interests. Thus, extradition was confined to what we should now call political offenses.

It is mainly within the last 100 years that a deeper international comity has developed. Increased intercourse and modern means of transportation have greatly facilitated flights from justice, while a sense of common interest has done much to diminish international jealousy and distrust. Each decade it has become more evident that the failure of civil justice in one country is likely to result unfavorably to its neighbor. No country has ever willingly received the convicts of another, and it was not possible that nations with liberal ideas should long fail to perceive that there was no great difference between encouraging crime and furnishing an asylum for fugitives from justice. If, then, there was a common national interest in the punishment of criminals, and if offenders against foreign laws were undesirable immigrants, extradition was both an advantage and a duty.

The great writers on international law have not been in harmony on the question as to

whether extradition is, in the absence of agreement, a matter of international obligation. Some of the ablest have argued in the affirmative, but the modern writers, like Bluntschli, Fiore, Phillimore, Westlake, Hall, and Moore, who have so successfully labored to place the law of nations on a sound legal basis, are agreed that the obligation is a purely moral one. But the wisdom of the practice is generally recognized, as is the principle that, owing to the great difference between the political systems and penal codes of different nations, it was better for them to give their mutual obligations in this respect definite expression in treaties. The real history of extradition in England begins with the Ashburton Treaty of 1842 with the United States. Excepting the Jay Treaty of 1794, which contained provisions for extradition limited to 12 years, all the other treaties covering this subject made by the United States are of a subsequent date. The conventions between the United States and Great Britain, in 1842, 1889, and 1900, show what offenses two leading nations of to-day consider extraditable. The first covered the crimes of murder, assault with intent to commit murder, piracy, arson, robbery, forgery, and the utterance of forged papers; that of 1889 added voluntary manslaughter, counterfeiting, or altering money, embezzlement, larceny, fraud by a bailee, banker, etc., perjury or subornation of perjury, rape, abduction, child stealing, kidnapping, burglary, etc., piracy by the law of nations, revolt or conspiracy to revolt by two or more persons on board a ship on the high seas, crimes and offenses against the laws of both countries for the suppression of slavery and slave trading; and the supplementary Treaty of 1900 added the crimes of obtaining money, valuable securities, or other property by false pretenses, willful and unlawful destruction or obstruction of railroads endangering human life, and procuring abortion.

The tendency is to enlarge the list of extraditable crimes; but there are many offenses which, for obvious reasons, cannot properly be included. Such are political crimes and offenses against religion and marriage laws. The general rule is that an extraditable crime must be one commonly recognized by civilized nations as *malum in se*, and not merely *malum prohibitum*.

The method and prerequisites of extradition may, perhaps, best be shown by a quotation from the Ashburton Treaty. It provides that the two powers shall, upon mutual requisitions, deliver up to justice all persons charged with the commission of certain crimes, "provided that this shall only be done upon such evidence of criminality as, according to the laws of the place where the fugitive or person so charged shall be found, would justify his apprehension and commitment for trial if the crime or offense had there been committed; and the respective judges and other magistrates of the two governments shall have power, jurisdiction, and authority, upon complaint made under oath, to issue a warrant for the apprehension of the fugitive or person so charged, that he may be brought before such judges or other magistrates respectively, to the end that the evidence of such criminality shall be heard and considered; and if, on such hearing, the evidence be deemed sufficient to sustain the charge, it shall be the duty of the examining judge or magistrate to certify the same to the proper executive authority, that a warrant may issue for the surrender of such

fugitive." The complaint under oath is commonly made by a consular officer of the state asking for extradition. If all the proceedings are satisfactory, the President of the United States (in our practice) causes the surrender to be made to the agent of the demanding power. The expenses are borne by the party making the requisition.

There are two limitations on the practice of extradition which are worthy of notice: 1. It is an almost universal rule that a state will not surrender its own citizens to a foreign power. This is due to the national sentiment that leads each nation to regard its own laws and administration of justice as superior to those of foreign powers, and to the equally natural desire to give its own citizens the benefit of those laws. 2. It is generally regarded as an abuse of the principle of extradition for a state to secure the rendition of a criminal for an extraditable offense and then to try and punish him for an offense not included in the treaty.

From the fact that difficulties in regard to extradition are most satisfactorily anticipated by treaties, it should not be inferred that extradition has not taken place without them. Spain and other countries having no treaty of extradition with Great Britain have surrendered criminals upon her requisition. The rule in the United States is neither to ask nor to grant extradition in the absence of a treaty, but this country has not disdained to accept this evidence of international comity from other states—as when Spain of her own volition surrendered the notorious William M. Tweed to the New York authorities in 1876—and has acted on the principle herself in the surrender of Arguelles to Spain in 1863.

The law of extradition between the different States of the United States is laid down in Art. IV, sec. 2, of the Constitution, and in a law of Congress of Feb. 12, 1793. The former reads: "A person charged in any State with treason, felony, or other crime, who shall flee from justice and be found in another State, shall, on demand of the executive authority of the State from which he fled, be delivered up, to be removed to the State having jurisdiction of the crime." The latter provides for the form in which the demand shall be made, whereupon it shall be the duty of the Governor to whom it is addressed to cause the fugitive to be arrested and delivered over to the agent of the other State. The prerequisites of a valid demand are a formal charge that a crime has been committed against the laws of the demanding State, and that the person charged has fled to the State on whose executive the demand is made. It is the duty of the Governor on whom the demand is made, although the alleged offense may not be a crime in the State where the fugitive has sought an asylum, to deliver the fugitive, but its performance which is sometimes refused cannot be compelled.

EXTRALITE. See EXPLOSIVES.

EXTRAORDINARY RAY. See LIGHT.

EXTRATERRITORIALITY. See EXTERMITORIALITY.

EXTRAVAGAN'TES CON'STITU'TIO-NES (Lat. *extra*, outside + *vagari*, wander). Papal constitutions of John XXII and some of his successors, supplemental to the "Corpus Juris Canonici." They got their name from the fact that they were not arranged in order with the other constitutions, but were "outside wanderers" from the general code.

EXTRAVAGAN'ZA (It., extravagance). A musical or dramatic piece of great wildness or absurdity, characterized by extravagant and fantastic qualities. The term is often applied to various other kinds of writing marked by unbridled or eccentric fantasy.

EXTRAVASA'TION (from ML. *extravasatus*, extravasated, from Lat. *extra*, beyond + *vas*, vessel). The escape of any of the fluids of the living body from their proper vessels through a rupture or injury in their walls. Excrementitious matter thus sometimes escapes into the abdomen through a wound or ulceration of the bowels. But the term is oftenest used in speaking of the escape of blood from injured blood vessels. Extravasation is distinguished from exudation by this, that in the last the vessels remain entire, and the effusion takes place by filtration through their walls; nor does more than a part of the blood so escape, the blood globules being retained, while in extravasation entire blood is effused. Many kinds of extravasation are rapidly fatal, such as that of urine or of bile into the abdomen, or of blood from the vessels of the brain in many cases of apoplexy. The dark color resulting from a bruise is due to extravasated blood from lacerated capillaries.

EXTREME UNCTION (Lat. *extrema unctio*). A sacrament of the Roman Catholic church, which, as the other sacraments supply spiritual aid in the various circumstances of life, is believed to impart to the Christian grace and strength to encounter the struggle, as well spiritual as bodily, of the dying hour. The rite of unction or anointing in different forms is common to four of the sacraments; the name "extreme" is given to that of the present sacrament because it is reserved for the last act of the Christian career. The Council of Trent declares this sacrament, although "promulgated" in the well-known passage of St. James v. 14, 15, to have been "instituted" by Christ. The fathers frequently allude to the rite of unction, and although many of these allusions certainly refer to the unctions of baptism and confirmation, yet several passages in Origen, Chrysostom, Cæsarius of Arles, and Pope Innocent I., are interpreted as referring to the unction of the dying. In the various separated churches of Oriental Christians—Greek, Coptic, Armenian, and Nestorian—the rite is found, although with many ceremonial variations. In the Roman Catholic church the sacrament is administered by the priest, who, "dipping his thumb in the holy oil, anoints the sick person, in the form of the cross, upon the eyes, ears, nose, mouth, hands, and feet, at each anointing making use of this form of prayer: 'Through this holy unction, and His most tender mercy, may the Lord pardon thee whatever sins thou hast committed by thy

sight. Amen.'" And so of the hearing and the rest, adapting the form to the several senses. Extreme unction is reputed by Catholics one of the sacraments "of the living"; i.e., it ordinarily requires that the recipient should be in a state of grace, or, in other words, should have received the remission of his sins by absolution or by perfect contrition; but it is held to remit, *indirectly*, actual sins not previously remitted, and also (although not infallibly, but according to the merciful designs of Providence) to alleviate, and even to dispel, the pains of bodily disease. The holy oil which forms the "matter" of this sacrament must be blessed by the bishop—a ceremony which is performed with great solemnity once each year by the bishop, attended by a number of priests, on Maundy Thursday. The oil so blessed is reserved for use during the year. Formerly several priests united in the administration of the sacrament, and the custom is still maintained in the Greek church; among Roman Catholics one priest now administers it. The Greek form of words also differs, although not substantially, from that of the Latin church. The Greeks call this sacrament "the holy oil" and sometimes "the oil of prayer." Consult: Schanz, *Die Lehre von den heiligen Sacramenten* (Freiburg, 1893); Schmitz, *De Effectibus Sacramenti Extreme Unctionis* (ib., 1893); Kern, *De Sacramenti Extreme Unctionis* (Ratisbon, 1907); Fuller, *The Anointing of the Sick in Scripture and Tradition* (London, 1904). See UNCTION.

EXUMAS, eks-ŭ'máz. An archipelago in the British West Indies, part of the Bahamas (q.v.), between Andros and Long Island (Map: West Indies, C 1). It comprises the islands of Great Exuma, Little Exuma, and the Exuma Keys, occupying a total area of about 150 square miles. Little Exuma has one of the best harbors in the Bahama group. The inhabitants are employed partly in agriculture, but chiefly in salt making. Pop. (of group), 1901, 3086; 1911, 3405.

EYAS, í'as. See FALCONRY.

EYB, íb, ALBRECHT VON (1420-75). A German writer and humanist, born in Franconia. He studied at Pavia, became Archdeacon of Würzburg in 1449, and later entered the service of Pope Pius II. His work on marriage, entitled *Ehestandsbuch* (1472), has frequently been reprinted. The most recent editions are those of K. Müller (in modern German) (Sondershausen, 1879) and Herrmann (Berlin, 1890). Consult Herrmann, *Albrecht von Eyb und die Frühzeit des deutschen Humanismus* (1893).

EYCK, ík, HUYBRECHT (HUBERT) (c.1365-1426), and JAN (JOHN) (c.1385-1441) VAN. Brothers, Flemish painters, founders of the school of painting of the Netherlands. Their fame rests upon some of the greatest services to modern art that it is possible to conceive. They were the first to perfect and successfully use oil as a medium for mixing colors, which revolutionized the painting of Europe; to use the landscape as an accessory, which contributed to the harmony of the painting; and to discover aerial perspective, learned by the Italians 50 years later. The figures of their panels were thoroughly naturalistic—real Flemish men and women. As there are practically no survivals of Flemish painting preceding theirs, it is difficult to ascertain the evolution of their art: but

from a study of the illuminated manuscripts and tapestries of the late fifteenth and early sixteenth centuries it is evident that Hubert's art represents the culmination of mediæval painting in northern Europe; while Jan, like Leonardo in Italy, incorporated in his art the naturalistic and technical elements of all that preceded in northern France and the Netherlands. The perfection of the oil technique was probably due to Hubert, who was much the elder; but the other innovations were due to Jan.

The brothers Van Eyck take their name from a little town on the Maas, near Maastricht, called Maaseyck, where they were born. The dates of their birth are variously assigned. There is no proof for the assumption that Hubert traveled widely in Europe. From reliable documentary evidence we know only that in 1425 he was paid for two sketches of a painting ordered by the city council of Ghent, and that in the same year he was employed on a large altarpiece for Robert Poortier and his wife in St. Savior's, Ghent. Before this time he had begun the great altarpiece of Ghent upon which his fame chiefly rests. Between Aug. 1, 1425, and the same date, 1426, the magistrates of Ghent visited his workshop, probably to inspect the altarpiece. He did not live to finish this work, but died on Sept. 18, 1426, and was buried in the crypt directly under the chapel, which was afterward adorned with his masterpiece. As regards the life of Jan, we are better informed. He was probably the pupil of his brother, who much exceeded him in years. From c.1422 till 1424 he was in the service of John of Bavaria, then living as Count of Holland at The Hague, employed in decorating his palace. After this patron's death, in 1425, he was appointed court painter and valet de chambre (a sort of chamberlain), with a salary of 100 livres a year, to Philip the Good, Duke of Burgundy. He lived at Lille with the Duke, who employed him upon various diplomatic missions—in 1426-27, e.g., on two secret missions of importance, for which he was liberally rewarded. In 1428-29 he was one of the embassy sent to Lisbon to negotiate the marriage of the Princess Isabella of Portugal to his master, and painted a portrait of the princess, which confirmed the Duke's choice. During his stay in Portugal he became acquainted with the southern landscape and vegetation which henceforth appear in his pictures. He made a pilgrimage to Santiago di Compostella and visited the Alhambra. After his return to Flanders, Christmas Day, 1429, he settled at Bruges, and there he finished the altarpiece which his brother had left incomplete, on May 6, 1432. From 1430 till his death was the period of his ripest and best work. He was visited and honored, not only by the magistrates of Bruges, but by Duke Philip, who stood sponsor to his son in baptism and finally increased his yearly pension to 4320 livres (Parisian). In 1436 he was sent upon another distant diplomatic mission. He died at Bruges on July 9, 1441, and lies buried in the church of St. Donatus.

The great polyptych in the church of St. Bavon, now the cathedral of Ghent, is the masterpiece of the brothers Van Eyck. It is not known who gave the original commission; but it was certainly completed at the expense of Jodoc Vydt, Lord of Pamele, etc., a prominent burgher of Ghent. It contains more than 20 panels portraying the central dogma of the Christian religion, the "Redemption from Sin

through the Sacrifice of the Lamb." Both exterior and interior of the altar are painted. The predella, now lost, represented "Purgatory"; the central part of the exterior is the "Annunciation," of wondrous charm, and above it the prophets "Micah" and "Zachariah" and the "Two Sibyls," who foretold Christ's birth and sacrifice. In the centre, below the "Annunciation," are "John the Baptist" and "John the Evangelist," the patrons of the church, painted like contemporary stone statues, and on either side of them kneeling figures of the donors, Jodoc Vydt and Isabella Burluut, his wife—portraits of admirable realism. The interior of the altar, opened only on great occasions, reveals the central truth of the Christian faith, for which the exterior prepares us. It is painted in two tiers, the upper representing heaven. The central panel is the majestic figure of "The Almighty Enthroned"; on the left is the "Virgin," wearing a precious diadem, on the right the austere figure of "St. John Baptist"—all more than life size. There follow the "Angel Musicians" and the "Angel Singers"—delightful Flemish maidens—and at the extreme ends are the panels of Adam and Eve—the first important nudes in northern painting. The central and principal panel of the lower tier is the "Mystic Sacrifice of the Lamb," in a marvelous southern landscape, and with a multitude of Apostles, saints, prophets, and heathen seers who foretold the sacrifice. The two panels on the left typify the laity—the "Knights of Christ," riding majestically forward, and the "Just Judges," with supposed portraits of the brothers Van Eyck. On the right the clergy—the "Holy Hermits" and the "Holy Pilgrims"—march sturdily forward.

The part taken by the two brothers in this great work is a subject of much controversy. The general plan is due to Hubert, but most of the execution to Jan. From Jan's other works we know that his art was very minute and realistic, and it is reasonable to suppose that Hubert, who was much older, approximated more closely to the mediæval manner, which was more monumental. Applying this criterion to the Ghent altar, the central figures of the "Almighty," the "Virgin," and "John the Baptist" must be assigned to Hubert, and part at least of the "Adoration of the Lamb." The attribution of other works to Hubert is very doubtful—such as certain miniatures in the celebrated *Book of Hours* of Duc Jean du Berry, photographed before they were destroyed by fire at Turin in 1904; and numerous recent attributions of paintings, more probably to be ascribed to Jan.

The Ghent altar is the most impressive religious monument of northern painting and ranks in importance with the Brancacci Chapel in Florence. It was held in the highest repute, both when it was executed and in the centuries following. It survived the Burgundian wars and the iconoclastic riots of the Reformation. Philip II in vain attempted to acquire it for Spain, but had to content himself with a copy finished by Michiel Coxie (q.v.) in 1559. The original was taken, in part, to Paris during the French Revolution, but was returned to Ghent. After its return the wings were sold, and are in the Museum of Berlin, except "Adam" and "Eve," which are now at Brussels. The central panels are still in Ghent Cathedral, the wings being supplied by Coxie's copies.

A far larger number of paintings may be
